**ZINC** for roof covering, 118

# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

### THE PROSPECT.

**D**URING the last year the activity of the building profession and trades has been unabated, though higher records may be shown. There has been continued progress in most of the branches of building in the provinces. The yearly reports of city surveyors which we have received show that a large number of building schemes are in progress, or have been passed by local authorities of our great towns, and there has been a general briskness in many places, as at Wakefield and the surrounding neighbourhood. Our own pages have illustrated and recorded the erection of many important buildings in Glasgow, Manchester, Nottingham, Birmingham, and other great cities, from warehouses and commercial establishments to civic halls and municipal buildings of various kinds, and we can simply refer our readers to our illustrations and descriptions of them, to be found in our last two volumes. When we open their pages, and find two such diverse buildings as those of the workhouse for the city of Nottingham and a large and palatial warehouse in Piccadilly, Manchester, for a well-known firm, followed by important competition designs for Taunton Town Hall, to which several of our leading architects contributed; and the municipal buildings of Henley-on-Thames; the head offices of the Metropolitan Asylums Board; the East Ham Public buildings; and the competition designs for the Southern Hospital, Carshalton, we are not far wrong in coming to the conclusion that the progress of building has not been confined to one particular direction, but that architects have been engaged upon structures of very diverse kinds, requiring skill in the adaptation of forms and architectural style. In most of those we have named the design has been characterised by breadth and common-sense treatment of features, suggested by the plan rather than by a slavish adherence to conventional treatment. Better results in some instances might have been desired, and this naturally suggests to the reader the selection of professional assessors who are quite competent to judge of the merits of plan, while they have no strong preferences for any particular style. In a few of the competition designs for important public buildings, the proper man has not always been selected for his special knowledge of the class of buildings in view.

The most significant architectural event, because of national or public character, that has happened during the last year has been the passing of the Public Buildings Bill and the selection by the Government of two architects out of eight names submitted by the Institute—Mr. William Young for the Ad-

miralty Buildings, and Mr. J. M. Brydon for the War and other offices in Great George-street. No greater opportunity has been given to any architect during the present generation. There were many who thought, not without reason, that important public buildings of this kind should be submitted to general competition; but the experience of the Government hardly justified the experiment. It is satisfactory to know, however, that the original intention to limit the ability of the chosen architects to the design of the façades, to be fitted to plans prepared by the Office of Works, has been abandoned, though that department will be consulted in the arrangements of the buildings—a mode of procedure that, had it been followed in the Home and Colonial Offices, would have saved those buildings from the serious defect of planning they now have—the result of restrictions put upon Sir Gilbert Scott by the officials of his day. The profession will await with interest the design and arrangements of the two blocks of Government offices, as upon their success will depend, in all probability, the design and construction of future buildings of the kind. The sites chosen in Whitehall and Great George-street are at once dignified and unique, and offer to the architect advantages and a free scope in the development of his work. These designs will, no doubt, have an influence on the architecture of the future. Classic or Renaissance features will have to be followed, if any regard is to be shown to the surroundings; but it is to be hoped that we may look for something in advance of the existing buildings, and worthy of the situation.

One other event in prospect is the selection of a site and a design for a building worthy of the municipal offices for the Metropolis—a question, as far as we can see, still in abeyance. That the London County Council ought to have a central position, and a building worthy of their official importance, cannot be denied, and in this connection we can only refer to the resignation of Mr. Thomas Blashill, the able Superintending Architect of the Council, and the late unsuccessful attempt to find a successor in that office. Recently, too, as the result of a conference between the Council and the London School Board, the Council, instead of the Technical Education Board, agreed to undertake the responsibility for the Science and Art instruction in London.

The housing of the working classes is one of the many vital questions awaiting the decision of our municipal authorities. By the large areas that have been opened by street and other improvements, an immense population of the poorer classes have to be provided for. The question whether they

are to be housed in buildings near the old sites, or are to be provided for in our suburban districts, is one of great importance, not only to the classes themselves, but to the residents of our fast-filling suburbs. The extension of the tramway system, and the proposal to keep the cars running through the night, as well as the facilities afforded by the completion of the Central London and other underground railways, seem to favour the erection of dwellings in outlying districts; but the result is not reassuring, as the effect of these erections is likely to drive the commercial and professional citizens further out. The design and erection of dwellings for the labouring classes is one of the pressing questions of the future. How can they be made agreeable, not to say attractive? How can they be planned and built so as not to injure other buildings in their vicinity? The high-block system is an eyesore to any suburb, as can be proved by anyone going to Camberwell, Brixton, Fulham, and other localities.

The transformation of estates by the extension of shops in residential neighbourhoods is equally a serious outlook not in London only, but in many of our large towns. Legislation of a private or public kind can only meet the evil, and ground owners can restrict the letting of their land to private dwellings; but the over-building mania threatens to destroy many of our fairest suburbs near the Metropolis, despite the regulations of the London Building Act.

One of the many things of a professional nature that is in a fair way to be accomplished, despite the opposition of a few exclusive bodies, is the Registration of the Architect. Professional opinion on the Continent and in America no longer hesitates as to the advantages to be secured by the legal recognition of competence, and the protection of all architects from charlatans and others who have no right to the title. The Bill for this object, like many others, has been before Parliament for some years, and there is little doubt it will receive renewed support every time it is presented. The Plumbers' Registration Bill has also been read twice in successive Parliaments, and must ultimately become law. Very often, indeed, the larger the body of public opinion in favour of a measure, the greater the difficulties encountered by the promoters. The advancement of technical education, and the more systematic education of architects, are questions that have received a very large amount of attention during the past year, and we may now begin to look forward to the results. Our craftsmen have now a more complete and perfect acquaintance with their work and tools than they ever had before, and we may confidently expect a better class of workmen

in the future. As we have pointed out, there are certain drawbacks in the system as at present in operation, which admit of removal. The young architectural student also has now every opportunity to learn his profession in its comprehensiveness open to him, if he will only take advantage of the facilities, and learn so much of his art as he is capable of mastering without making himself a learned crib or being too self-satisfied to learn more.

#### THE WORKS OF REMBRANDT.

THE Winter Exhibition at the Royal Academy of Arts is devoted to Rembrandt, and a magnificent display it is, far surpassing the Amsterdam collection, and including many of the choicest works of the great Dutch painter, mostly from English houses and collectors. It is impossible in a brief notice to speak of more than a few of the principal pictures. Of course, the larger part consists of portraits. In the first gallery is a portrait of "The Painter's Mother," a small panel; the Duke of Westminster lends two portraits, one a fine portrayal of Nicholas Berchem and his wife, the latter a daughter of Wils, the Dutch landscape painter—a round-faced woman, half-length, with white ruff and cap; Earl Spencer's picture of "The Circumcision" (5), and the Duke of Buccleugh's portrait of "The Painter," painted in 1659. He is shown wearing a dark cap which he much affected, and the background is dark. The partially-shaded face of "An Old Woman" (8), in the Duke of Buccleugh's collection, is a fine example—the woman's face is shaded by a hood. Earl Brownlow's "Isaac and Esau," full of detail and technique, is a fine example; and one may further notice Lady de Rothschild's "Portrait of the Painter" (18). Light falls on the brow and nose, the rest of face in shade, a very admirable example of expression and chiaroscuro. There are numerous portraits of the painter as a young man, in middle life, and in age. Lord Iveagh's half-figure portrait of the painter holding a palette and brushes, in brown mantle lined with fur and in white cap, is a good example of one of his last, a sturdy-looking old man. In the second gallery we notice the Queen's "Christ and Mary Magdalene at the Tomb," a sombre view of the sepulchre overshadowed by foliage—the figures of Mary Magdalene and the Saviour are not very distinct; "Girl at a Window," from Dulwich College; "An Old Woman Reading" (36, Earl of Pembroke's), bending over a book which rests on couch (not held on lap, as in catalogue); "Portrait of Burgomaster Six" (38); a fine-toned landscape "The Mill" (40), lent by the Marquess of Lansdowne, remarkable for its sunlight and deep shadowed effect; a portrait of "A Man" in cap, full of character; and the "Portrait of an Old Lady" from the Windsor collection (45), a very beautiful partially-shaded face, with hood; over head and shoulders known as "Countess of Desmond," and two other portraits from the same collection. Gallery III. is exceptionally strong in noble examples, and we can only mention a few. The Duke of Devonshire's portrait of "An Old Man" (54) is fine in tone, light, and shade; but of more interest and less known is "Belshazzar's Feast," lent by the Earl of Derby; the figure of the king is larger than life, and the composition by no means attractive; crude and harsh is the king's face, but the picture is interesting, nevertheless, as showing the painter's failure in painting subjects of this size—it is dated 1636. Very realistic is the Earl of Yarborough's portrait of "An Old Lady" (65), in dark-trimmed dress with ruff and white cap. The furrowed brow and puckered skin of hands are most carefully painted. The "Adoration of the Magi," from Buckingham Palace (66), is dark, and the composition and figures are

indistinct. Next to it is the marvellous and well-known picture, also from Buckingham Palace, "The Shipbuilder and his Wife" (67), one of the best examples of the painter. The ruddy-faced, good-tempered man, in black dress and white ruff, with pair of compasses in hand, turns himself to take a letter from his wife; painted in 1633. The animation and expression on the face of the old man and his wife are remarkable. There are five portraits of the painter himself. The Earl of Ilchester's (61), dated 1658, shows a heavy-looking, rough-faced, stout man. Capt. Heywood-Lonsdale's (64) is warm in tone, and shows a younger man, dated 1637; another shows him in a brown robe and turban, dated 1661. "A Lady with a Parrot" (75) is well known, and belongs to Lord Penrhyn; and fine colour is seen in portrait of "Saskia" (77). The Duke of Devonshire's portrait of "A Rabbi" (83) is a very fine example, with gold embroidered turban and jewelled clasp. No. 57 is apparently a replica.

In the last gallery the Corporation of Glasgow's "Man in Armour" (85) deserves notice, and there are several subject pictures, as "The Prodigal Son" (89); but the most interesting and little known is the Duke of Abercorn's picture of "A Deposition," representing the body of the Saviour lying on a white cloth, supported by Joseph of Aramathæa with the Holy Women, dated 1650. It belongs to the painter's best period, when his art was fully ripe. The emaciated body of the Lord has the purple hue of death, contrasted with which the red drapery of the Virgin makes a pleasant note; the young Magdalen is at the foot of Cross. There is deep pathos and sadness in the expression of the two Marys; the younger one looks almost terror-stricken in anguish, and there is an Italian feeling about the composition. Other pictures worth notice are Lord Leconfield's "Portrait of a Lady" (55), Earl Cowper's "Portrait of a Man" (72), Capt. Holford's "Man with a Sword," full of expression and animated in attitude—a fine mellow-toned picture. Other wonderful pictures are to be seen; but everyone should examine the very choice studies and sketches in the water-colour room, chiefly in pen and bistre wash.

#### MODEL SPECIFICATIONS.—XLVI.

##### SANITARY AND WATER-SUPPLY FITTINGS.

AS regards cisterns and service-pipes a few things should be remembered. Lead-lined cisterns ought to be without solder, lead-burnt joints only being used. Rising mains should be of a sufficient bore, large enough to keep up the supply of cistern when the water is being drawn off from the several taps. A stop-cock protector from frost should be put on main just outside the house, easily accessible. There should also be a draw-off cock above it for emptying the pipe in case of frost. All service pipes should be placed on some internal wall. When against an outside wall they should be cased or protected from frost by packing of slag wool or felt. Their diameter should be regulated by head of water from cistern to draw-off tap; the greater the head, the smaller the pipe. Mr. Hellyer, in his work, gives a table of sizes of service pipes and valves, by which we see that a head of water under 6ft. requires a 1½in. pipe and valve for flushing a rim closet; a head of 7ft. and under 12ft., 1½in. pipe; 13ft. to 18ft., a pipe of 1in.; and above 18ft. a pipe of 1in. for that purpose, with valves to correspond. The sizes of pipes for sinks and draw-offs are smaller; for a head under 6ft., ¾in. to 1in.; for a head under 12ft., ¾in. to 1in.; under 18ft., ¾in.; and above 18ft. head, a pipe of ¾in. to 1in. Drawn-lead pipes have several advantages over iron pipes—they can be easily bent or bossed; but the socket and spigot of iron pipes do not lend themselves to bending.

Lead soil-pipes are made in 10ft. lengths, but iron in 6ft. lengths.

Some authorities recommend Spence's metal for jointing iron pipes; or the socket may be packed round with yarn and molten lead then poured in and well battled. Jointing iron or lead soil-pipes into earthenware drains should be carefully done. The soil-pipes should be flanged, to grip the cement firmly, and such joints should be vertical.

Lead soil-pipes should have wiped joints, and fixed with soldered tacks to the wall. (See sketch.) When of iron with branches of lead, brass-ferrule connections are to be made to comply with L.C.C. rules.

We show a joint between lead and iron pipe. A piece of brass pipe slightly larger than the lead and 6in. long has its upper end turned prepared for a wiped joint; the brass ferrule is slipped over the lead pipe, the lead dressed as shown under the ferrule. It is soldered at upper end, and the brass ferrule end is slipped into socket of iron pipe and packed with yarn, and molten lead poured in, and battled home with caulking tool and hammer. We also show the connection of lead pipe with cast-iron bend, showing the brass ferrule and wiped joint, and lead joint above level of paving. It is necessary to support the pipe at base by means of an iron standard at the foot of soil-pipe. We also show two kinds of closet apparatus of approved form, Doulton's "Simplicitas" wash-out, in which the full force of the the flush is exerted directly on the water in trap; and Duckett's "Wash-down" pedestal closet, "The Clencher," where there is a large water surface and a seal of 2in. One important point in this form is that the water is conducted from foot of fall-pipe to flushing-rim by means of two oblique channels, and the flush is strong.

When several branches are connected to soil-pipe anti-siphonage-pipes 2in. diam. must be put in, taken from closet-traps, and carried up and connected to soil-pipe. The outlet-pipes from closets should be as short as possible.

Galvanised-iron cisterns are made in three qualities—the ordinary "strong," ¾in. plate bare; ¾in. plate full. The following are a few capacities and sizes:—

25gal.	2ft. long	1½ft. wide	1½ft. deep.
50	2½ft. "	1½ft. "	1½ft. "
100	3½ft. "	2½ft. "	2½ft. "
200	3½ft. "	2½ft. "	2½ft. "
500	6½ft. "	4½ft. "	3½ft. "
1,000	8½ft. "	5½ft. "	4½ft. "

A good flushing-cistern should discharge and fill quickly and noiselessly, and a well-directed three-gallon flush is required to clear out the closet soil-pipe and drain. There are several varieties. The siphon-action waste-preventers are numerous. In some it is started by displacement, in others by a cap over mouth of siphon which the pull raises, by a piston-plunger, by lifting a metal plate, by admitting the water direct to the flushing-pipe, or by lifting the w.c. flush-valve. We can recommend those patented and supplied by Messrs. Doulton, Jennings, Duckett, and other well-known firms.

Sinks for pantries should be lined with 8lb. lead for the bottom at least; when of copper, 3½lb. to the foot is required for bottom, and 2½lb. at the sides.

Waste pipes from sinks should discharge into intercepting traps, and be carried down just below the grating; or they may discharge over a grated and trapped gully, or over a trough or channel discharging into a gully 18in. away; but the first plan is the least offensive. Doulton's yard gullies are made in several forms. Duckett's patent self-cleansing channel gully conforms to the Model By-laws of the Local Government Board, and other good forms of gullies are in the market. Bath wastes should discharge over trapped gullies.

The London Building Act and other

Regulations impose several conditions on the plumber which a specification should take notice of.

The regulations under the Metropolis Water Act, 1871, give the sizes and weights of pipes, the manner of fixing, the provision of stop-valves, cistern ball-taps, overflows, &c., and a penalty of £5 is imposed on any person

nect such thimble with the iron soil-pipe or drain by means of a joint made with molten lead, properly caulked." And it proceeds, where a stoneware trap or pipe is connected with a lead soil-pipe, "he shall insert between such stoneware trap or pipe and such soil-pipe a brass socket or other similar appliance, and he shall connect such stoneware trap or pipe by inserting it into such socket, making the joint with Portland cement, and he shall connect such socket with the lead soil-pipe by means of a wiped joint." No soil-pipe is to be directly connected with the waste of any bath, rain-water pipe, or of any sink; and the soil-pipe is to be constructed "so that there shall not be any trap on such soil-pipe or between the soil-pipe and any drain with which it is connected."

We append a few other clauses for external work:—

18. *Roofs and Domes.*—Cover cupola with 6lb. sheet-lead dressed over rolls as shown in detail, and copper-nailed on one side, with welted horizontal joints, and dress the final over in 7lb. lead.

19. *Dormers.*—Put to the dormers, where the ridges meet the main roof, 6lb. lead soakers.

20. *Lead-covered Dormers.*—Cover the flat on top of dormers with 6lb. lead lapped over ends, and bossed and dressed over 2in. deal rounded rolls; the dormer cheeks to be of 5lb. lead, secured by soldered dots and brass screws, with welted ends on front edges copper-nailed.

21. *Flat over Billiard-Room.*—The flat over billiard-room to be covered with 6lb. sheet-lead laid to falls of 1½in. (or 2in. or 3in.) in 8ft. (or 10ft.), with 2in. drips, properly dressed over rolls, drips, and tilting fillets with bossed ends; the lead to be turned up 6in. against walls, with 5lb. lead flashing, 6in. wide, properly passed and tacked with 5lb. lead aprons over curb of skylight, &c.

#### INTERNAL PLUMBING.

31. *Valve-Closets.*—The first and second floors to have approved valve-closets (Jennings' or Underhays') of best white ware basin, copper bellows regulator, with ½in. supply unions, with stopcock to each for shutting off supply. Take ½in. vent-pipe from each valve-box through wall, and finish with brass perforated grating; connect ¾in. anti-D lead siphon-traps to a ¾in. lead pipe arm branched into a ¾in. diameter lead soil-pipe of 10lb. per foot, with astragal beaded joints, ears, and rose-headed nails 6ft. apart (or with wiped joints, with 6lb. lead tacks every 8ft. or 10ft. apart); carry down to drain, and connect in a workmanlike manner. The soil-pipe to be

at its junction with drain a brass ferrule, wiped on to connect socket of stoneware drain, and joint same with neat cement. The soil-pipe to be carried up its full diameter to a height of 5ft. above eaves of roof, covered at top with copper wire.

35. *Air-Pipes.*—Connect 2in. lead anti-siphonage pipes to traps of all branches at a point not less than 3in. from highest point on outgo side with a vertical pipe of same diameter, carried up at side of soil-pipe, and taken into it 4ft. above top branch, and secured to wall by lead tacks. The joints of connection to be wiped joints.

36. *Galvanised-Iron Cistern.*—Fix in position marked in roof plan a 300-gallon galvanised wrought-iron cistern with strong angle-stays and cross-stays or rods, close riveted. The cistern to be incased with lin. wrought and beaded boarding, with a 2in. space to be filled in with silicate cotton, and to have a double-cased, rebated lid on top, hinged with 18in. cross-garnett hinges. Or—

Provide and fix where shown on drawings, on proper bearers, a galvanised wrought-iron riveted cistern to contain 250 gallons, with perforations for supplies and overflow. Jacket the cistern with slag wool, and incase same with ½in. match-boarding with close-fitting hinged flap. The connections of all lead pipes to be made with brass boiler screws and double nuts and unions.

37. *Lead-Lined Cistern.*—Fix on roof a 300-gallon lead-lined cistern of 1½in. wrought, grooved, and tongued boarding, dovetailed at angles and bottom. Line same with 6lb. (or 7lb.) milled lead, dressed over top edges and copper nailed.

The cistern to be carried on 10in. by 3in. fir bearers, and to be incased in felt or have a silicate cotton packing, as above described.

38. *Supply Pipe.*—The supply pipe to have extra full-way screw-down gunmetal stopcocks fixed on outside, packed with hair-felt or silicate-cotton in iron guard-box, with cover complete.

39. *Rising Main.*—The rising main to be lin. (or 1½in.) lead pipe, taken to cistern and fitted with gunmetal high-pressure equilibrium ball valve with copper ball, and take all services from main of ½in. or ¾in. (state to where taken). Or—

Excavate ground in road and pavement, and connect to company's main with ½in. (or lin.) screw ferrule and union, take ½in. (or lin.) lead pipe as rising main, encase when in ground in lin. tarred rough deal gutter trough 2ft. 6in. deep in ground and filled with pitch, fill in ground, and leave road and footway in good condition. Carry the rising main to cistern or cisterns on roof, and terminate to each with a ½in. (or lin.) high-pressure equilibrium ball valve with copper ball, and put gunmetal stopcock and spanner on lobby complete.

40. *Main Service and Pipe.*—Tap cistern, and connect with lin. brass union and washer 1½in. from bottom, and carry lin. lead service-pipe to lowest draw-off. Put lin. screw-down brass (or gunmetal) stop-cock near cistern.

41. *Branches.*—From this main branch off ½in. pipe to slop-sink, ½in. to lavatory, ½in. to housemaid's sink and butler's pantry, scullery sink, washing trough, and lin. to scullery sink. Each to have a ½in. (or lin.) gunmetal screw-down ball-cock p.c. 10s. each.

(Note.—Horizontal service-pipes to have a fall towards main.)

42. *Feed Cistern and Supply to Range.*—Branch off ½in. lead to cistern of range and connect to range with lin. supply. Provide and fix a cast-iron galvanised feed cistern, 10in. by 1ft. 3in. by 7½in., with cover, &c., complete. Take a separate lin. galvanised-iron supply pipe, with lin. brass union, to kitchen range for circulating boiler, and put on lin. stopcock under cistern.

43. *To Bath.*—Take a separate lin. lead supply to bath, with brass union and washer, with lin. stopcock placed under cistern.

44. *Bath.*—Provide and fix in deal bearers a 5ft. 6in. strong tinned copper bath enamelled white (or green), with copper overflow arm and extra large copper waste valve, lin. nickel-plated hot and cold supply valves complete, p.c.—Or No.—in Young and Marten's or other catalogue.

#### THE BURNE-JONES PICTURES AT THE NEW GALLERY.

THE private view of this unique exhibition took place last Saturday at the New Gallery. Although the directors of the New Gallery had an exhibition of the works of Sir Edward Burne-Jones not many years since, they were quite justified in repeating the exhibition in a more comprehensive manner since the death of the great painter. We have here 225 pictures and designs, besides numerous sketches and studies. In the South Room a very choice collection of the

who violates, refuses, or neglects to comply with the regulations.

The County of London Regulations give a table of the diameter and weight of lead and iron soil-pipes to be used, and state: "Every person who shall provide a soil-pipe outside or inside a building shall cause such soil-pipe to have an internal diameter of not less than 3½in., and to be continued upwards without diminution of its diameter, and (except where unavoidable) without any bend or angle being formed in such soil-pipe

6

to such a height, and in such a position as to afford by means of the open end of such soil-pipe a safe outlet for foul air, and so that such open end shall in all cases be above the highest part of the roof of the building to which the soil-pipe is attached, and, where practicable, be not less than 3ft. above any window, within 20ft., measured in a straight line, from the open end of such soil-pipe. He shall furnish the open end of such soil-pipe with a wire guard covering, the opening in the meshes of which shall be equal to not less than the area of the open end of soil-pipe."

"In all such cases where he shall connect a lead trap or pipe with an iron soil-pipe or drain, he shall insert between such trap or pipe, and such soil-pipe or drain, a brass thimble, and he shall connect such lead trap or pipe with such thimble by means of a wiped or over-cast joint, and he shall con-

carried up full-bore, 5ft. above eaves of roof, and have a copper wire rose to top. From top of each trap take a 2½in. anti-siphonage pipe, and connect to ventilating or anti-siphonage pipe carried up above roof.

32. *Wash-down Closets.*—Provide and fix on first floor Doulton's wash-down closet "Simplicitas," basin and trap in one piece, white ware, with stout mahogany-hinged seat, No. — in catalogue, with flushing rim; or a washdown pedestal closet in which the full force of the flush is exerted directly on the water in the trap, with the basin so formed as to be entirely cleansed by the action of every flush; or provide and fix the "Clencher" washdown (Duckett's), or the "Deluge" (Twynford's), or other closet with all fittings and connections complete.

33. *Intermediate Cistern.*—Provide and fix over each closet an intermediate deal cistern to hold 6gals., and lined with 6lb. lead or of galvanised iron, with 1½in. overflow, ½in. branch service pipe and copper ball, and 1½in. lead flushing service-pipe to closet.

34. *Soil-Pipe Connection to Drain.*—Put to soil-pipe

early work of this great master of the ideal will come upon many for the first time. Beginning at about the year 1861, we find such inimitable works as those of "Clerk Saunders," illustrative of the "Minstrelsy of the Scottish Border"—two most delightful figures essentially pre-Raphaelite in manner, "A Love Scene" (3), "The Blessed Damozel" (4); the Chaucerian legend of "Dorigen of Bretagne," the maiden robed in blue; the "Adoration of the Magi," a fine composition, decorative in character, forming one panel of a triptych, originally painted as an altarpiece for St. Paul's, Brighton. The figures are portraits of William Morris, Algernon Swinburne, and the painter; the background of gold, and the colouring extremely rich. The other two panels represent "The Annunciation." Very beautiful and ideal in conception and colour is "Cinderella," a girl in greenish dress and white apron, standing in front of a dresser full of blue china (11). The rich colour in "Laus Veneris" (15); the essentially decorative but later work "Dies Domini" (23), a circular panel, showing Christ in blue flowing robe, in the act of benediction, descending on the wings of angels; but there is nothing finer than the six panels illustrating "The Days of Creation" (39), lent by Mr. Alex. Henderson, M.P., a wonderful unfolding of the six days, each day symbolised by a beautiful maiden holding a crystal globe; reflected in each are the various creations—we believe the first important work which brought into notice the ideal power of the artist. It was exhibited at the Grosvenor Gallery 1877. Here we have, too, the legend of the "Briar Rose," or the story of the Sleeping Beauty, in three pictures—the early version. The Princess asleep on a richly-draped couch, with attendant at her side, lent by Mrs. Mackail, is graceful also and full of delicate harmony. Again, in "The Merciful Knight," a knight showing mercy to his enemy, prostrate before a crucifix on a wayside shrine, the figure on which bends forward and embraces him, is a work full of wonderful passion and technical detail, and dated 1863, now belonging to Mr. John T. Middlemore. Many of these works, particularly the last, show the influence of Rossetti on the painter. In the West and North Rooms the later developments of Burne-Jones art are seen, but they are so well known, as having been hung at the Grosvenor Gallery, and duly noticed in the BUILDING NEWS, that it is unnecessary to refer to them in detail, except as embodying the ideal of the master who looked upon the mystery of life with its wealth of form and colour, and tried to give its expression on canvas. As Rossetti once said, according to Mr. Comyns Carr's appreciative sketch (prefixed to the catalogue) of the painter lately passed away, "There never has been a painter more greatly gifted than Burne-Jones with the highest qualities of poetical invention." As "painted poems" we have to look and judge of these performances, as it was the one thought the painter kept before him. He once said that "if I could travel backward, I think my heart's desire would take me to Florence in the time of Botticelli." How deeply imaginative, rising above the mere facts of nature, we find such works as those of "The Golden Stairs," the "Chant d'Amour" (109), "The Hours," "King Cophetua and the Beggar Maid," the large centre subject in the West Room, "The Mirror of Venus" (99), and "The Depths of the Sea" (101). Some of these are known to the public by engravings, but we have here the pleasure of making anew our acquaintance with them, and their beauty and imaginativeness again charm us. Very beautiful in composition and colour is "Caritas," a full-length figure of Charity, lent by Lord Wantage: "Love Among the Ruins," exhibited in 1894, and lent by Mrs. R. H. Benson, is here also. Visitors to the Old Grosvenor Gallery will recognise the large upright composition of "The Annunciation," where the Angel Gabriel descends into a court, in which the Virgin, clad in white, stands (now belonging to the Earl of Carlisle); they will see also the remarkable picture, "The Wheel of Fortune," with its fine modelling of figures lent by the Rt. Hon. Arthur J. Balfour, M.P.; and the lovely six maiden figures symbolising "The Hours" (93). But the picture above all others that awaits the public verdict, that has never been exhibited before, still unfinished, and upon which the artist had been engaged for 18 years at the time of his death, is "Arthur in Avalon"—a colossal canvas measuring 21½ ft. in length by 11½ ft. in height, lent by the executors of the artist. It is

indeed a wonderful composition. The king lies asleep in his armour in the centre of a marble cloister under a golden canopy with panels of reliefs illustrating the history of the Holy Grail. Three queens watch over him at the head and foot of the couch, and in front are graceful maidens with musical instruments, while on the right and left are attendant graceful figures holding horns and the king's armour. Others are peering into the valley awaiting the signal for his awakening, the legend being that after his last battle, the mythical king wounded was conveyed by three queens to the Isle of Avalon, and that he slumbered, there awaiting the moment to resume his sovereignty—the belief was that he did not die, but was "had into another place." The romance of the scene, the grass plot with its canopied couch, the expectant maidens with their instruments, the meandering rivulet bordered by forget-me-nots, the water plants, the blossoms amidst foliage in this beautiful vale, make up a picture of legendary and poetical beauty. The draperies and harmonies of colour are broad, and the technical qualities of the picture in its finish will rank with any of the works of the painter. The composition by its arrangement suggests a design for a huge tapestry. Is it too much to hope that this picture may find a home in the Tate Gallery, for it is too large for most private collections? As a picture it will take its rank as one of his best works. A great decorative picture is "Sponsa de Litano," lent by the Corporation of Liverpool: "Awake, O north wind, and comethou south; Blow upon my garden," &c. The swirl of draperies is effective. Here, too, we see the "Perseus and Sea Nymphs," and others of the Perseus series, such as the "Baleful Head," "Perseus and the Graia," lent by the Rt. Hon. Arthur J. Balfour. The central hall contains a colossal unfinished picture of the "Triumph of Love," lent by the executors, where Love is represented on a triumphal car drawn through a narrow street by his countless victims. Each figure is life-size—it is a design of considerable promise. Nor will the visitor go away without admiring the splendid tapestries from Burne-Jones's cartoons, woven under the direction of William Morris for Mr. D'Arcy of Stanmore Hall, representing six scenes in the legend of the "Quest of the San Grail," and every student of art will value the series of water-colour and crayon studies which cover the sides of the central hall, and show how the painter composed and perfected each figure of his finished picture, as he did of his last great unfinished work. In all that he did Burne-Jones expressed his own individuality.

#### THE EFFECT OF FREEZING ON CEMENT-MORTAR.

SOME interesting experiments have been made by Mr. A. C. Hobart, Fellow in Civil Engineering of the University of Illinois, on the effect of freezing on cement-mortar. The phenomena incident to the freezing of freshly-mixed cement mortar have already been investigated with tolerable thoroughness, and Mr. Hobart, therefore, devoted himself mainly to the study of such mortars, frozen only after setting had begun. In order to secure uniform conditions, he obtained the use of a room in a cold-storage warehouse, where a constant temperature was maintained of about 20° Fahr., and the briquettes of cement, of various kinds, were removed to this room after a definite period had been allowed for setting in the rooms of the Engineering Laboratory. The cements experimented with were all of sorts not much used in the East, the natural brands being Clark's Utica, Louisville Black Diamond, Louisville Star, and Akron; while only two Portland cements were used, Saylor's and Dufosse's. With all these, freezing immediately after moulding caused loss of strength, and, where frozen in contact with water, total disintegration; but where the briquettes were allowed to set before freezing the result was very different. In the case of the natural cements, where the briquettes were allowed to set for six hours, or, in some cases, less, and then frozen, it was found that the strength, instead of being diminished, was greatly increased, such briquettes, after careful thawing, resisting a greater tension than similar briquettes of the same age which had not been frozen. Mortars made with two parts sand to one of cement were more favourably affected than the one-to-one or the neat mortars, the Louisville Black Diamond briquettes, mixed two of sand to one of cement, allowed to set for

two or three hours only, showing, after freezing, and subsequent thawing, a resistance about three times as great as that of similar briquettes, made at the same time, and tested at the same time, but not frozen meanwhile. It is curious that the same mortar, if allowed to set for several days before freezing, gained much less by the process, but even after fourteen days' setting freezing added something to the strength. With Portland cement there was no gain by freezing in any case, and, generally, a considerable loss, but the loss in strength was less when frozen after twenty-four hours' setting than after six hours, and mortars made with a considerable proportion of sand lost, proportionally, much less than neat cement. The conclusions which Mr. Hobart draws from the experiments are, that cement-mortars, made either with natural or Portland cement, if frozen in the presence of water, are likely to be disintegrated and destroyed; but that, if extraneous moisture is kept away from them, natural-cement mortars, if allowed to set from three to six hours, are improved by subsequent freezing; while mortars of Portland cement, under such circumstances, lose strength, particularly when mixed with a large excess of sand. Moreover, while mortars of natural cement usually suffer a slight surface disintegration by freezing, although the total resistance of the briquette is greatly increased, briquettes of Portland-cement mortar show no change on the surface, although their strength may be almost entirely destroyed.

#### THE NEW PHYSICAL LABORATORY OF THE OWENS COLLEGE, MANCHESTER.

THE laboratory, of which the foundation-stone has been laid on the 25th anniversary of the occupation of the present Owens College buildings, will be the largest and most completely equipped in this country. It stands on a separate plot of ground adjoining the Owens College site, and consists of a main building and a large annexe, the latter being more especially intended for electro-technical work. The principal building is 100ft. long, and over 60ft. wide, and consists of a basement and three stories. The cost of the buildings, with fittings and new apparatus, is estimated at £30,000. It is intended to have, at least, one room set aside for constant temperature work, and to establish a small plant for the production of low temperatures. An electro-technical laboratory will be added, in which large currents will be available for electric furnaces. One of the features of the laboratory will be a carefully-planned system of ventilation, combined with an attempt to exclude dust, as far as possible, from all rooms, and especially from the instrument-cases. The architect is Mr. J. W. Beaumont, who, before finally drawing the plans, was sent by the council of the Owens College to visit the principal modern laboratories of Germany.

#### NORTH WILTS CONSERVATIVE AND UNIONIST CLUB, SWINDON.

THIS club has lately been built in Fleet-street, New Swindon. It is erected with the local red bricks and covered with blue slates, but Bath stone from the Hartham Park Quarries has been used for the whole of the front elevation. The accommodation on the ground floor is as follows:—Bar, 38ft 3in. by 30ft. 3in., with recess for serving-bar; card room, bowling saloon, 55ft. by 22ft., with two alleys, and stewards' apartments, &c. On the first floor is the concert-room, 39ft. 6in. by 31ft., exclusive of stage in recess; committee-room, stewards' bedrooms, &c.; and on the second floor, billiard-room, 31ft. by 24ft., with lantern light in roof over, and a reading-room, 23ft. by 15ft. The floors on ground floor are laid with pitch-pine wood blocks. The lobby at front entrance has a marble mosaic floor with the name of the club worked in the pattern, and the passages, &c., are laid with hydraulic red tiles. The joinery is of varnished pitch-pine. The bar has a framed dado of this material, and the cabinet and barrel-stand is in pitch-pine and mahogany, as is also the counter, which has teak pilasters. The total cost of the building, including the site and furnishing, is about £6,000. The contractor was Mr. Charles Williams, of New Swindon, who carried out the works from the designs of the architects, Messrs. William Drew, M.S.A., and Sons, of Swindon.

NORTH WILTS CONSERVATIVE AND UNIONIST CLUB, SWINDON.—MESSRS. W. DREW AND SONS, Architects.

## OIL AS A ROAD MATERIAL.

THE great interest that is now being awakened in all parts of the United States in the good roads movement is born of necessity. In the keen competition in all the markets of the world, America is at a disadvantage, commercially, by reason of bad roads, much as the railroads have done to bring the producer and the consumer close together. The best investigations yet made on the subject show that it costs, on an average, 25 cents per ton mile to market the produce of our farms over the country roads, often much more; or the farmers spend as much for one mile as the railroads ask for 75 miles of haulage.

Great areas of our prairie farm country are remote from any supply of good road material, and the outlook for good roads in these sections is discouraging, on account of the expense. Some cheap substitute for stone, brick, or gravel, if it could be found, is most desirable.

I venture to suggest to your readers that possibly cheap oil may be one solution, and offer this paper in order to induce others to multiply the experiments I am now making. On a certain clay road in Pennsylvania, which lay deep in dust in summer and deep in mud in winter and spring, there was an oil-pipe line by the side of the road, which on a certain occasion sprung a leak, and spouted a considerable quantity of oil on to the road. An observer noted that for a space of several rods, to which the oil was transported by horses' feet and waggon wheels, this road showed a marked improvement. The dust in summer did not rise, the mud in spring and winter did not exist. The explanation would seem to be that the oil formed a water-tight covering to the road, and the earth beneath being dry, no ruts or mud could form, and the road became good.

At the recent Good Roads Convention in St. Louis, Mo., the writer brought forward this idea, and offered it as a possible help to improving our dirt roads at a small cost, occasioning considerable comment. It seemed rational, and, at least, easy to try, and many asked questions not easy to answer, for want of sufficient knowledge as to method of applying the oil, the best kind of oil to use, the quantity to put on the road, &c.

As confirmatory of the value of oil on roads, the following observations were made:—A gentleman from California said that near Santa Barbara, where he lives, they have oil wells, and have used the oily sand from the borings to fill holes and ruts in the road, and in places the sand has even been distributed over the roadway. In all these places the road is free from dust in the dry season (a great curse out there), and perfectly hard and firm in the wet season; and he now thinks it must be due to the oil in the sand. Another gentleman said he used to handle oil at Austin, Texas, in years gone by; he remembered the lot, of perhaps a quarter acre, where he had his depot became sprinkled with oil from leaky cans, and was always hard and firm despite the weather, and he thought it must have been the oil that did it. Another, a road builder from Missouri, said that on a muddy road leading into his town a man let a barrel of black oil fall from his waggon, breaking it and spilling the contents. Ever since then he had noticed there was a firm piece of road near that place, where it did not get muddy or rut, and he thought this was due to the oil. A railroad man said the Pennsylvania Railroad began spraying their roadbed with oil to lay the dust, and now found it not only laid the dust, but shed water, kept down the weeds, and preserved the ties.

The present experiments are being made through the liberality of the Standard Oil Company, who, by Mr. Rockefeller's orders, placed a tank of crude oil at the disposal of the writer. On November 20, the writer coated a newly-graded piece of dirt road with oil, distributed by means of an improvised sprinkler, over a strip about 12ft. wide by 200ft. long.

A second part of the roadway was sprinkled more lightly about 300ft. further, making 500ft. or 600ft. in all, and used eight barrels of oil in the experiment. The day after the sprinkling was done and before the oil had time to become absorbed, for it soaked in very slowly, a heavy rain fell. The road was examined during the rain, and quite a marked difference was seen between the oiled and unoled portions. Where oiled it was evident that the dirt beneath the surface was still dry and retained its supporting power, while on each side of the oiled portion it was muddy and rutty. A heavy freeze, with the temperature at zero, followed the

rain, and on the 25th the road was again examined. The oiled part was still more different from the neighbouring stretches. The unoled road was cut up with ruts 1in. to 2in. deep, and frozen rough and hard; the oiled portion was perfectly smooth, and the wheels made on it a muffled sound that showed the dirt beneath the surface was unfrozen and dry.

It will scarcely be possible until the spring thaw comes to really estimate the value of the oil; but at present the experiments seem to promise well. It is too soon to make any good estimate of the quantity of oil required per mile of road. It will possibly vary with the character of the soil, whether loam, sandy clay, or gumbo. The place selected for this experiment is a regular black gumbo, which cuts normally into ruts hub-deep, and holds the water like a jug.

My object in this paper, as before said, is to present it to your readers, among whom there are no doubt many who are interested in roads, and induce experiments on varying qualities of soil. To meet with success, the following conditions, in the writer's opinion, should be observed:—

1. The road should be smoothly graded and rounded well, so as to shed water.
2. Apply the oil to the roadbed while dry. If the soil is filled with water, the oil will penetrate with difficulty, and much of it will be carried off on the wheels of passing waggons.
3. It will be well to roll the ground after the oil is put on. It has a tendency to collect in ruts and small hollows, and the roller would force it into the soil and distribute it evenly.
4. Crude oils costs from 60 to 90 cents per barrel at the wells. Its odour is disagreeable, and oil from which the naphtha and kerosene has been extracted would be preferable to apply in warm weather. When cold the heavy oil becomes too stiff to be applied without heating. This could be overcome by some form of spraying apparatus, using a jet of steam.—M. MILES, U.S.C.E., U.S. Engineer Office, Keokuk, Ia., in the *Scientific American*.

## EXPERIMENTS ON BRIDGES.

A VERY complete series of experiments on bridges under moving train-loads is given in a paper by Mr. F. E. Turneaure, Assoc. Am. Soc. C.E., in the *Transactions* of that Society. We can only give here a few of the conclusions under the several heads of the paper. The results are given in tables. Under the head of "Vibrations in Girders and Trusses" it is stated that the principal points brought out by the data in this table are: (1) the increase of deflection or flange stress due to vibration is about the same on all spans from 25ft. to 55ft. in length, and has a maximum value of about 50 per cent. for speeds of 40 or 50 miles per hour. For spans of 60ft., 70ft., and 85ft. in length the maximum percentages are 22, 28, and 17 respectively. (2) Speeds greater than about 20 miles per hour for short spans, and 35 miles per hour for long spans almost invariably caused large vibrations. (3) The rates of vibration of the bridges for high speeds and large amplitudes agree approximately with the rates of the revolution of the locomotive drivers, and show clearly that the chief cause of vibration is the effect of the locomotive counterweights, &c. The tests on trusses are given in tables showing the ratios of deflection to span-length. The results show the comparative uniformity in the maximum percentages added to deflection by vibration. The rate of vibration of the structures agrees quite closely with that of the revolution of the drivers, indicating that, as in plate-girders, the chief cause of vibration is the unbalanced wheels:—The general conclusions are given at the end of paper, and are chiefly: That speeds less than about 25 miles per hour are not likely to result in much vibration; the increase in deflection due to vibration caused by locomotives running at speeds of 40 to 50 miles per hour is likely to be 40 or 50 per cent. for girder spans of less than 50ft. in length; this percentage decreases rapidly for longer spans, becoming about 25 per cent. as a maximum for 75ft. spans; the relative increase in chord stress is about the same as in deflection, that in centre diagonal is somewhat more than in the deflection; and in hip vertical it corresponds more nearly to that in girders of 40ft. to 50ft. span; secondary stresses are likely to be high in small girders with self-angles and in some parts of trusses. The tables given in the paper are numerous. Taking those of

open trusses for which diagrams are given showing stresses in thick lines, the columns give the number of the bridge and its span, the number of experiments made, kind and direction of train, weight of engine and tender, diameter of drivers, speed of train. The results give deflection in inches, percentage added by vibration stress on chord, with percentage by vibration added, stresses on diagonal with the same addition, and stress in hip with the same addition, &c. Those who are interested in experiments of this kind will find the paper of Mr. Turneaure, with its tables of results, a useful contribution on moving-load experiments.

## DOVETAIL METAL SHEETS AND LATHS.

THE "Cunnah-Wright" patents are pretty well known to the profession as a very effective mode of constructing fireproof, sound, and damp-proof partitions, floors, ceilings, drains, full particulars of which can be obtained of the Fireproof Partition Syndicate, Ltd., 25, Billiter-street, E.C. The patent sheets are formed of iron or steel sheet, with a double dovetail corrugation, given to it by passing it through special machines. This dovetail corrugation, of course, gives great rigidity to the sheet, as well as an excellent "key" for plaster on both sides. For partitions and walls the sheets can be fixed between small flanges of H-shaped standards, and T or channel iron being used for beads and sills. Special rolled sections for this purpose are made. Any plaster can be used if worked stiff. Many important applications of this valuable metal sheet and lathing are shown in the Syndicate's catalogue, showing how dwellings and other erections of one story can be erected. The walls so constructed are only 2in. thick, and are absolutely fire and damp-proof. Iron or wood stanchions may be superseded by brick piers at the angles and at intervals. For isolation hospitals, factories, bungalows, and other buildings which require to be speedily erected, the material is admirably adapted. The shafts of cylindrical columns can be formed by the patent metal lath, and as a fireproof casing for stanchions, girders, coverings, &c., nothing could be better. The patent metal laths are much stronger than wooden laths; the studs can be placed farther apart (18in.) and the "key" is excellent. As a "filling-in" between half-timbered work, the architect will do well to specify it. A very excellent floor for factories or warehouses can be made by placing sheets of this material on the lower flanges of steel joists, and filling up between them with concrete. The sheets can be suspended by iron clips to the flanges, and, of course, arched ceilings can easily be made by the use of the Cunnah-Wright sheet. A specimen slab of this construction is before us, and is a marvel of strength and hardness.

## CHIPS.

Sir Charles Elliott has opened a new elementary school for 100 children built at a cost of £3,000 by the Duke of Bedford on his estate at Potsgrove, near Woburn.

In the church of St. Ignatius-the-Martyr, Sunderland, built by the late Bishop Lightfoot at his own cost as a thank-offering, a window has been dedicated. It is in the west end, and has three lights, and has been executed by Messrs. Burlison and Grylls. It consists of nine cartoons, illustrating the late bishop's life, work, and inspiration.

The rural district council of Malpas have adopted a scheme, prepared by Mr. Davenport, of Nantwich, for the supply of water to the village of Bickley, at an estimated cost of £2,000.

A bronze statue of the celebrated Polish poet and patriot Adam Mitskevitch was unveiled at Warsaw last week on the centennial anniversary of his birth.

We are requested to state that Major Hector Tulloch, C.B. (retired), Royal Engineers, and lately Chief Engineering Inspector of the Local Government Board, is not the person who was a director of the West Australian Trading Syndicate, two of the directors of which are under prosecution by the Public Prosecutor.

The Wimbledon Urban District Council have applied to the Local Government Board to sanction the disposal to the South-Western Railway Company of certain lands adjoining the railway in consideration of the railway company reconstructing and widening the Gap-road Bridge. The council further propose to borrow £2,000 for improvement works in Wimbledon.

## AVILA CATHEDRAL, SPAIN.

ALTHOUGH Avila is on the central line of railway, it is by no means well-known, though its buildings are of the greatest interest. The town is located midst an arid desert, and its surrounding tawny plains may account for the infrequent visits of the architectural tourist. The churches of Avila are rich in archaeological charms; for instance, in the small Romanesque church, on the walls, the monuments of Bishop San Segundo and of Prince Juan, only son of Ferdinand and Isabella, may be particularly mentioned. There are some beautifully-carved stalls in the coro at the western end of the building. Till within a few years ago children were permitted to play in this deserted church, and boys broke off pieces of the monuments and sold them to chance customers. The beautiful figures have remained, however, comparatively uninjured, and at the present time an inclosure of rough wood serves to keep off intruders. The other churches of the city are equally interesting. The cathedral was built by Garcia de Estrella in 1107, and is extremely curious, partaking more the form of a fortress outside than a church. The apse beyond the choir projects over the ramparts of the town wall, and, with its machicolated skyline, is fortified like a castle. Storks make their nests unmolested in the belfry of the lofty tower, whose pinnacles crown the composition. Mr. Wallace Rimington's beautiful water-colour drawing, which, by the courtesy of Mr. Pryce Weedon, we are enabled to reproduce to-day, gives a capital idea of the charming architecture which distinguishes the interior of this remarkable cathedral, with its grey Gothic arches and glorious stained glass. The retablo of the time of Ferdinand and Isabella is enriched by the paintings of Berreguete and Borgona. The rood beam is draped with a crimson hanging, which in Mr. Wallace Rimington's drawing, furnishes an exquisite contrast to the sombre tones of the arched walls. The building is groined, and a great feature is made of the organ on the north side of the choir. The town itself is unchanged, and still wears a Mediæval character all its own. A few of the houses are magnificent and elaborated with decorations; but for the greater part even the houses of the nobility, or what remains of their families, are plain and simple in style. Every house has its stone balcony over the entrance, and the portal generally has shields or coats-of-arms sculptured upon it, after the typical Spanish fashion. Most of the houses are arranged round the usual courtyard, and out of this the "cuerpo

de casa," or house proper, is reached. The chambers opening out of the large entrance-hall are only used on special occasions. The ordinary dining-room is more like a kitchen, and generally has an enormous chimney occupying one side of the apartment; but no cooking is done here, though the huge wood fire common in winter time is perpetually burning. Low benches are fixed against the walls. The windows overlooking the street have only shutters, but the lights of the inner chambers are furnished with glass. Here, in just such a house as this, Dona Teresa de Cepede was born in 1515, one of the most extraordinary women of the age and country. In her convent at Avila is her shrine, which occupies a spot in the chapel made sacred by an incident of her somewhat morbid, but beautiful, devotion. In the garden of the nunnery is an apple tree planted by Teresa, which is believed by the faithful to produce fruit which is good for every species of female disorder. Thus legend and history combine to add charm to the town and its buildings, while the unrestored condition of the architecture of the city enhances its merit beyond the limits of a brief description.

## MINEHEAD UPPER TOWN, SOMERSET.

WE published a view and plan of Minehead Church in the BUILDING NEWS for August 19th, 1892, on the occasion of the Architectural Association's excursion to this part of Somersetshire. To-day we print a more recent view of the upper town looking up towards the south side of the church, and showing the old thatched and plastered houses of this charming old village, which stands high above modern Minehead with its villas, shops, and seaside hotels. The ancient simplicity of the upper town remains unchanged, save that every now and again a fresh coat of pinkish-yellow colour-wash is applied to the stucco walling of the cottage fronts, or, possibly, a luckless fire sweeps away one of the dwellings. This catastrophe fortunately is a rare occurrence, though it did happen a few years ago, and the ruins still record the fact opposite the church porch on the upper road. To reach this upper road from the main streets of the upper town a series of rambling and stepped footways have to be climbed on the way to church, where Mr. Luttrell, a member of the famous Luttrell family of Dunster celebrity has been parson for any number of years. The churchyard is very steep on the side of the hill, from whence the tower has an exceptionally commanding effect, and makes a charming feature in a most beautiful landscape. The church inside is noted, of course, for its wonderful screen, dating from 1499. There is a good font, an interesting altar-table with angel figures of Jacobean date, a traceried and carved Gothic chest of rare quality and richness, and the Bacton monument on the north side of the sanctuary. The tower of the church is plain as compared with others in this district. It was built in the 15th century, and has some quaint sculptures of St. Michael weighing souls, and a representation of the Trinity. The turret containing the rood-loft staircase makes a pretty feature on the south side of the church.

## SCHOOLS, PORT SUNLIGHT.

THESE schools have been erected in a central position in the picturesque village which Messrs. Lever Bros., Limited, are building for the use of those engaged in connection with their extensive works. The bridge in the foreground spans a ravine, which, by retaining its natural slopes and fine trees, assists in realising the *ensemble* of an old English village. The school at present accommodates 500 boys, girls, and infants, but, owing to the growing needs of the place, the infants' department is shortly to be enlarged. A separate room is provided for each class in the mixed school, so that the teaching may be as efficient as possible, while four of these rooms can be readily thrown open to the main hall by sliding back the glazed screens, which were supplied by Messrs. Peace and Norquoy. The large hall (including the four classrooms) is used for services on Sundays, a chancel with organ chamber and vestry under, being attached, but which can be screened off during the week. Facilities for teaching science, cookery, and wood-working are provided, and there are spacious playgrounds. The walls are of Raabon brick, with Helsby stone-dressings, and the roofs are covered with green slates. The woodwork is of oak—the floors being laid with wood blocks, except the entrances, lavatories and cloakrooms, which are tiled, and round which run glazed

brick dados. The heating and ventilation was carried out by Messrs. John King, Limited, of Liverpool. The schools were built (without a contractor) by Messrs. Lever's own workmen, and the care with which they were carried out is in a measure due to the able superintendence of Mr. R. Nicholson. Messrs. Douglas and Fordham (now Messrs. Douglas and Minshull), were the architects of both the schools and the bridge.

## THE RED HOUSE, AYR.

THIS drawing shows the seaward addition first proposed to be made to Red House. The new dining-room and billiard-room, with bedrooms over, were planned for the purpose of securing on the west a greater sea view; and on the south to open up in part the Carrick range of hills. The new wing would have been connected to the offices and older portion of the house by a service lobby and a wide corridor, the latter, with its garden entrance, forming the north side of the bulb garden. Continuing westward is a range of successive lawns and gardens, following the line of a broad central turf walk and divided from one another by walls or hedges. The garden has been laid out, but, in place of the extension here shown, the additions were made to the south side of the main house. The architect is Mr. James A. Morris, of Ayr, and the drawing was exhibited last year in the Royal Academy.

## NATIONAL GOLD MEDAL DESIGNS FOR BOOK ILLUSTRATION.

THE "Tempest" scene, with three figures on the upper part of our double-page plate, represents the entrance of the drunken butler, Stephano, drinking copiously, who discovers the monster Caliban and Trinculo, a jester, hiding under one cloak in terror of an approaching storm and of each other. (Act ii. sc. 2.) The next drawing, with numerous figures, represents the appearance of Ariel, like a harpy, at the mysterious banquet that by Prospero's magic is spread before the stranded king, surrounded by his nobles, and which suddenly disappears on the harpy clapping its wings, when it then recites their sins against the three conspirators. (Act iii. sc. 3.) The head-piece, I think, explains itself as a part of the rocky coast on which they were wrecked. In the last drawing, which is wholly unconnected with the others, Blue Beard's wife is in the act of opening the forbidden door, with excited anticipations of what she will see within.

MARGARET E. THOMPSON.

## NEW CHURCH OF ST. MATTHEW, CHAPEL ALLERTON, LEEDS.

THE church is one of considerable size, the main dimensions being, nave 102ft. long by 25ft. 6in. wide, and the aisles 15ft. wide. The nave has six bays with arches of good wide span. The chancel is 53ft. long, and the same width as the nave. There is no chancel arch, the nave being divided from the chancel by a high open screen. The organ is to stand on this screen, and this will give an effective arrangement, and the full value of the instrument will be got. There will be an ample loft on the screen. In style, the building is that of the 14th century, and is strictly of English character. Length will be its leading characteristic feature. It is simple in its detail, and is treated in a very broad manner. The tower is detached, except that a cloister-like passage leads from it to the church. The lower part of the tower is vaulted. The stones used are Ancaster and Bath, and red tiles cover the roof. The two east windows, those of the chancel and the side-chapel, will have stained glass. The church has been designed by Mr. G. F. Bodley, A.R.A., and is being carried out by Messrs. Stephens and Bastow. The cost will be about £17,000. The drawing reproduced was shown at the Royal Academy last summer.

## THE CANON'S HOUSE, GANDERSHEIM.

THE elevation of this example of the German Renaissance is both typical and suggestive, as it furnishes a somewhat uncommon treatment of a street front, and in other ways it is unusual. The town of Gandersheim is a comparatively small place some 35 miles S.W. of Brunswick, but its buildings make it certainly worthy of a visit. The town-hall (its chief glory) is a highly picturesque structure dating from 1581 to 1588. The Moritz, or Market Church, was destroyed in 1580 by fire, its ancient steeple alone remaining. Upon this site and with the materials saved out of the fire this Rathaus was constructed, the external outline of the church walls being made the measure for the precincts of the new building,

CHRIST CHURCH, MORNINGSIDE.

while the old walls of the choir were surrounded by a new wall. The choir, and symmetrically with it the newly-added portions of the building, were divided into stories, the lower one for vaults and cellars, and the upper for municipal offices. The new hall was located in what was once the church choir, and the windows, more or less original, give the apartment a very unusual effect. The entirely new portion then added extends westward from the old Norman steeple, and it exceeds the older building in width, the whole grouping very quaintly together, though some might consider the effect somewhat inharmonious. Mr. K. E. O. Fritsch, in his admirable work published by Mr. Von E. Wasmuth, of Berlin, a few years ago, under the title of "Denkmaeler Deutscher Renaissance," quotes the account, thus given by Bohnsack, as his authority for these particulars of the building of the town-hall. He also describes very briefly the old domestic building, of which we publish a double-page ink-pencil drawing to-day, and we are also indebted to Prof. Fritsch for the name of its architect—one "Master Heinrich von Oevekate," who designed the building after the fire for the Abbess Anna Erica von Waldeck in 1599. This house was long known as the Ladies' Institution; but in the course of years its use became diverted, though the name, more or less, in loose terminology, has seemingly continued to reflect the original ecclesiastical associations of the property as more strictly belonging to the times before the disastrous fire, to which reference has already been made. Its architectural detail, like most of the German Renaissance work, varies very much in scale and quality of design. The square bay windows, which are set so quaintly on the limits of the facade, are refined, and have delicate Ionic pilasters flanking their light, with skilfully-designed band-work above and below, interspersed with heraldic carvings. The coats-of-arms in the panels, too, reveal the hand of some very capable artist. The gable above the front, which so distinguishes the composition, is marked by strong and somewhat coarsely contrived scrolls or volutes, inclosing the several stages of the upper part in a masterful way. The wall fountain below is a sample of the Rococo period, adding, however, very considerably to the general effect by supplying an emphatic feature just where it is most wanted. Gandersheim is known for some steel and ironware factories, and the town possesses Latin and Burgher schools, a castle of historic fame, a monastery, and a hospital. It was walled in, but for a long while has extended itself beyond the old confines, and possesses two suburbs. One of the features of the old city is formed by the two public squares.

## HOUSE AT CLAREMONT PARK, BLACKPOOL.

THIS residence is in the course of construction at Blackpool, at a cost of about £5,000. The whole of the dressings are of Mr. Edwards' Ruabon red terracotta, the bricks being supplied by the same firm. Mr. H. Wade is the architect, and Messrs. Hilton are the contractors.

NEW RESIDENCE FOR LORD RIBBLESDALE.  
PARK-LANE, W.

THE illustrations show a new residence which is nearly completed for Lord Ribblesdale, and is built of Portland stone, Fareham bricks, and for

roofs green Westmoreland slates. The servants' offices are in the basement and under the side terrace, the accommodation being his lordship's room and dining-room on ground floor, and her ladyship's room, large drawing-room, and boudoir on first floor, while over on second, third, and fourth floors are fifteen bedrooms and a studio, as well as good clothes-rooms, stores, bathroom, &c., on each floor. The reception-rooms will be treated in the Georgian style, with Classic cornices, doors with pedimented heads, Ionic pilasters, &c., all finished in white and gold. The suggestion for design of the elevations has been taken somewhat from the garden front of Hampton Court Palace, and the grand staircase (which will be in white marble) has a treatment somewhat on the lines of Ashburnham House. The drawing was in this year's exhibition of the Royal Academy. The builders are Messrs. Bywaters. The fireproof construction is by Messrs. Dennett and Ingle; the plasterwork to the reception-rooms and staircase by Messrs. Jackson and Sons. This house is on a corner site, the next four houses having been also carried out by the same architect; while on the other corner site he is erecting new stables for Lord Ribblesdale, and two other blocks of stables adjoining them. Mr. Sydney R. J. Smith, F.R.I.B.A., is the architect.

## CHRIST CHURCH, MORNINGSIDE, EDINBURGH.

THE drawing herewith illustrated was shown at the Royal Scottish Academy in Edinburgh last summer. We also give a plan of the building, which shows the ambulatory round the apse, illustrated in the view. The church was finished some time since, but till now has not been illustrated, and as an example of modern Scotch Ecclesiastical architecture it is a notable building. Mr. Hippolyte J. Blanc, R.S.A., was the architect, but no further particulars have come to hand.

NEW RESIDENCE, BATH ROAD, READING, FOR  
MR. EDWARD FARRER.

THE site is in the best part of a residential neighbourhood. The building contains eight bedrooms, dressing-room, bathroom, linen closet, two w.c.'s, three reception-rooms, and usual offices; also wine, beer, and coal cellars. There is also a large billiard-room opening out on to the garden level. On the west side is a conservatory extending the whole length of house. It is built in red and grey brick, with white moulded brick and Bath stone dressings. The architect is Mr. W. G. A. Hambling, Reading, and the builder is Mr. W. Stokes, Queen's-road, Reading.

## ST. MICHAEL'S CHURCH, ABERTILLERY, MON.

THIS church has been erected on the site of a much smaller one, the latter having been pulled down on account of its unsafe condition, although erected not more than fifty years ago. The style is Late 13th-century, and the building will seat about 750. The plan includes nave and aisles, tower, chancel, large vestries with organ-chamber over and heating apparatus under, as well as a morning chapel on south side. The walls are of local stone with Bath stone dressings, and the interior, including the arcade, is of buff Ebbw Vale bricks, with Bath stone caps and base, &c. There is no chancel arch. Between the nave and chancel there will be a massive rood beam with a cross in centre. Over this beam the roof

is arched and panelled between two heavy principals which will carry the fêche, in which is hung a bell. Under this bell an open ventilating shaft is carried up from a trunk in roof, and inlet vents are constructed in the walls 6ft. above floor. The church is heated by fresh warm air by Messrs. Musgrave and Co., of Belfast. The glass comes from the studio of Messrs. A. Savell, of Albany-street, London, and the work is being carried out by Mr. A. P. Williams, Buiran, Abertillery, from plans and under the supervision of Mr. C. B. Fowler, F.R.I.B.A., of Cardiff. The district being a poor one, and funds being difficult to obtain, no ornament has been lavished on the building. Although a cheap, plain church, it is lofty and of good outline. From floor to apex of roof the height is 54ft. 6in.

## CHIPS.

The bells of Harpenden parish church, Herts, have been recast, and a sixth bell added. The work has been carried out by Messrs. Warner and Co., of London. The reopening took place last week.

Mr. Robert H. Boyce, who has just been created a Commander of the Bath, is just retiring from Her Majesty's Office of Works, in which he ranks as the senior first-class surveyor.

The new temporary fever hospital, Knutsford, is being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. Henderson McGill McBlain, for the past 26 years one of the staff of H.M. Office of Works, died on the 27th ult. of pneumonia at the early age of 42 years.

On Saturday the undertaking of the Sheffield Electric Light Company was formally transferred to the corporation of Sheffield in compliance with the deed of purchase. A cheque for £260,000 was handed to Alderman Franklin, the chairman of the company, and in return the chairman of the committee of the corporation received the conveyances of different properties of the company, and formally took possession of the same on behalf of the corporation.

A tender of over £10,000 has been accepted for the erection of new buildings for the London and County Banking Company, at the corner of Windmill-street and King-street, Gravesend.

Mr. R. Durnford, Assistant Commissioner, held an inquiry at the Guildhall, Taunton, on Thursday in last week, on behalf of the Charity Commissioners, to hear evidence concerning the proposed erection of a new town-hall and the contraction of a further loan for that purpose. The proposal of the market trustees is to borrow a sum of £30,000 for the erection of a town-hall on the Parade at an estimated cost of £13,650, and for the payment of the existing debt of £16,000. Mr. A. Basil Cottam, a member of the firm of Messrs. Samson and Cottam, whose design was selected in competition, exhibited the plans.

Mr. Tye, of Bradford, has just presented a stained-glass window to the German church there. It consists of an allegorical subject illustrating the text "Honour thy father and thy mother." The figures are painted in rich colours, and surmounted with delicate canopy work. The window is from the studio of Messrs. Powell Bros., of Park-square, Leeds.

At Rochdale, during last year, a larger number of dwellings were built than in any previous twelve-months; 515 new houses were certified as fit for occupation, and 260 more are still in course of construction.

Mr. F. T. Turton, the deputy-surveyor of Liverpool Corporation, has drawn up a report regarding the construction of dwellings for the labouring classes in Dryden-street and Rachel-street. The cost of the land and building is estimated at £15,100, and the net estimated rental is £665 7s. The Insanitary Property and Artisans' Dwellings Committee will invite the city council to approve the scheme.

A new stained-glass window has been given to the parish church of Gravesend, as a memorial. The window contains a central panel, on which is represented our Lord praying in the Garden of Gethsemane, and in the foreground are the three sleeping Disciples. The whole is surrounded by canopy work.

An extraordinary occurrence has taken place at Stranorlar Road Sessions, when Mr. McCorry, deputy-country surveyor, narrowly escaped with his life. He had refused to sign the certificates of about 300 road contractors, when many of them attacked him in court. The surveyor took refuge on the Bench, and the police kept the mob off him for two hours. McCorry at length escaped by a back window, jumped to the roof of another house, and, taking a circuitous route, reached a railway station three miles distant.

## OBITUARY.

MOSCOW has just lost its patron of the fine arts, PAUL MIKHAILOVITCH TRETIAKOFF, who possessed a splendid gallery of Russian pictures. Tretiaoff, who died on the 16th December, aged 66, came of a rich family of Moscow merchants, and early in life he began to collect the masterpieces, first of foreign, and then exclusively of Russian artists. In 1893 he made over the gallery and its contents to the town of Moscow, stipulating only that he should be allowed to add to the collection, which at that time numbered 1,276 Russian paintings, 471 Russian drawings, ten pieces of Russian sculpture, and 84 foreign pictures bequeathed by his brother. He had since increased this total of 1,841 to 2,212 works of art, now left to the nation.

## OHIPS.

At Exeter, John William Kerswell, builder, John Kerswell, jun., mason, and James Denning Clogg, clerk, have been remanded on a charge of stealing eleven bags of cement, the goods of Thomas Gabriel and others, cement merchants.

The Hills memorial village church at Penshurst, near Tunbridge Wells, opened on the 28th inst., has been built from plans by Mr. Maxwell Maberley Smith, of Berners-street, W.; Mr. Hope Constable, of Penshurst, being the contractor. The style is English Renaissance, and the facing materials are brick and local ashlar sandstone.

On Saturday the remains of Mr. George Fuge, foreman to the Plymouth Corporation Waterworks for nearly fifty years, were interred in the Plymouth Cemetery. There were in attendance a large number of friends and employes, amongst them being Mr. Bellamy, late borough surveyor, and Mr. Sandeman, water engineer.

On Friday the memorial clock tower which has been erected in the East Park, Wolverhampton, to the late Mr. John Lysaght, a well-known ironmaster, of Bristol and Wolverhampton, was handed over to the mayor and corporation to take care of in perpetuity. The funds were raised by the men in the employ of the late Mr. Lysaght at his ironworks in Wolverhampton. Mr. Lavender, of Wolverhampton, was the architect, and Mr. George Lovatt, of the same town, the builder. The clock was supplied by Messrs. John Smith and Sons, of Derby.

The Bath Stone Firms have taken over the old-established quarries of John Pearce, of Portland. The latter firm employs a large number of men, and among the contracts still running, and which it will take several years to complete, are—Belfast City Hall, 12,000 tons; Leeds Insurance Office, 10,000 tons; Patent Office, London, &c. The Bath Stone Firms propose to sink some £7,000 in bringing the working of the quarries up to date, and in generally improving the equipment of the business.

The recently-erected chapel at Salisbury Workhouse was opened and dedicated by the Bishop of Salisbury on Wednesday week. The building has been erected by Messrs. Kite and Son, of Fisherton, from plans by Mr. George Gordon, architect. It is Gothic in character, and is of brick, with courses of grey brick round the window, and elsewhere. In the nave there are six lancet windows, and in the chancel two, and an east window. It has a wood-block floor, and the seats are of pitch-pine, and are capable of accommodating 150 persons.

The west window of St. Mary's Church, Oatlands Park, has recently been rebuilt, the stained-glass removed and newly-designed glass inserted from the studio of Mr. J. Dudley Forsyth, of Finchley-road, Hampstead.

At Tuesday's meeting of the Birmingham City Council, a letter was read from Lady Burne-Jones stating that she would leave to the Municipal Art Gallery at her death the portrait of her late husband by Mr. G. F. Watts, R.A. The city council approved a proposal to lease 9,890 square yards of land for 999 years, for the extension of the Art Gallery.

The partnership heretofore subsisting between H. D. Davis and H. Emanuel, architects and surveyors, Finsbury-circus, E.C., under the style of Davis and Emanuel, is announced.

Sir Benjamin Baker, the engineer, and Mr. John Aird, the contractor, will leave England on Wednesday next for Egypt, in order to inspect the great works now being laid down at Assuan and Assiut for the new Nile reservoirs.

At Monday's meeting of the Leeds Corporation Tramways Committee, it was decided to equip the Beckett-street and York-road sections of the tramways with electric overhead system of traction, and to proceed with the work at once. It is hoped that the new system will come into operation by July or August, at the same time as that on the Headingley and Chapeltown line.

## Building Intelligence.

CANTERBURY.—A contract has just been approved by the Ecclesiastical Commissioners for England for the erection of an archiepiscopal residence in the Cathedral precincts at Canterbury in place of Addington Park, which was sold in the early part of the year. The remnant of the ancient archiepiscopal palace known as "Old Palace," which is situated close to the west front of the Cathedral, will form the nucleus of the new residence. The ancient palace was founded by Archbishop Lanfranc (1070-89), and first abandoned by Archbishop Wareham (1053-33) in consequence of a dispute with the citizens. In Cranmer's time (1533-56) it had fallen into decay, and was further gutted by a disastrous fire. It was restored by Matthew Parker (1559-76), who gave a magnificent entertainment to Queen Elizabeth within its walls, but he was its last occupant, and the building was after his time again allowed gradually to fall into decay. Some portion of the ruins has been alienated to the use of the King's scholars, and an ungainly red brick house in Palace-street, which incorporates some of the ancient structure and is occupied by the junior school, is still known as "The Palace." The remnant, which will now be incorporated in the new residence, remained the property of the Archbishops of Canterbury until about 30 years ago, when it passed to the Dean and Chapter and was transformed into workshops, but it has now been re-acquired. Mr. W. D. Caroe, F.S.A., is the architect, and the contract has been taken at £18,967 by Messrs. Barker and Co., of London.

EDINBURGH.—Building operations will shortly be commenced with the new halls and other premises for the Wesleyan Mission at the corner of Earl Grey-street and Wellington-place, a site at present occupied by St. John's School and two blocks of new tenements of shops and dwelling-houses. A sum of nearly £20,000 has been paid for the existing buildings and ground. The street and basement floors have been planned as business premises. The main entrance to the hall will be by a corridor leading into a crush room on an entresole floor. A staircase leads to large hall on first floor, and this hall is planned to accommodate, with gallery, 1,600 to 1,700 persons. At one end is provided a large recess for platform and future organ-chamber, with retiring-rooms adjoining. Staircases at each side lead to the street as special exits. On the first floor there is also arranged a small hall accommodating 280 persons, with platform at one end, and class-rooms and lavatories at the other. The upper floors are arranged for class-rooms, stores, and caretaker's house. The heating will be by hot-water pipes and radiation. The building will be practically fireproof, concrete floors and steel roofs entering largely into the construction. Externally the buildings have been designed in a free treatment of the French Renaissance. The whole scheme has been designed by Messrs. Dunn and Findlay, architects, Edinburgh. The total cost of the scheme will be over £40,000.

HARROGATE.—The Hon. H. E. Butler laid the foundation-stone of a Technical Institute and School of Art at Harrogate last week. The site of the Institute is at the junction of East-parade and Bower-road, and the total cost of the building will be about £6,000. On the ground floor there will be a cooking-room, with scullery and storeroom adjoining, a room for building construction, and, in connection with the art department, a room for advanced modelling, a room for studies from life and the antique, and two classrooms for bookkeeping and dressmaking. On the first floor are lecture-room and painting-room, and head-master's room, as well as a physics laboratory and a chemical laboratory and lecture-room. In the basement are a manual room and a large spare room, besides the usual provision for heating. The entrance will face Haywa-crescent, the staircase being in a central position and conveniently placed for access to all departments. The exterior is designed in a simple style of Renaissance—the corridors and laboratories will be lined with glazed bricks, dado height. The other rooms will have pitch pine dados. The building when completed will contain seven additional rooms. The architect is Mr. W. J. Morley, of Bradford and Harrogate.

SHERNBORNE, SANDRINGHAM.—The parish church of SS. Peter and Paul on the Sandring-

ham estate was reopened after restoration at a cost of £2,000 on the 24th ult. The church has hitherto consisted only of a small and insignificant nave, and for many years past presented but evidence of decay, neglect, and ruin. It has now, however, principally owing to the munificence of the Prince of Wales, been transformed. During the process of excavations the foundations of the original aisle and chancel were discovered, and the church now consists of nave, chancel, south aisle, and porch, the new walls being, like the old work, executed in rubble and flint. Externally the roofs to nave and chancel are covered with Broseley tiles, a stone cross surmounting the east gable and a bell turret the western. The roofs to south aisle and porch are covered with lead. An addition has been made to the churchyard, and all inclosed by a flint and carrstone wall, with an oak entrance-gate, and the churchyard itself has been levelled, turfed, and the memorial stones regulated. Internally the chancel has a wagon-headed roof in oak, treated with moulded ribs and carved bosses, those to nave and south aisle being of a plainer character. The piers to the south arcade (of the Decorated period), after being walled in for centuries, again divide the nave from the south aisle, the eastern end of which is intended as a future organ-chamber. The floors of nave and aisle are of wood blocks, the sacrum and chancel being laid with tiles and stone steps. The pulpit (on stone base) and the choir-stalls are in oak, and the font has been refixed on a stone slab. The only remaining brass, together with the Purbeck marble slab to which it is attached, has been restored and refixed in an upright position in the north wall of chancel. This probably commemorates Sir Thomas and Lady de Sharnborne, who were buried beneath the high altar in the ancient chancel. All the memorial mural tablets have been retained. The windows throughout are glazed with cathedral glass. The heating apparatus is by Messrs. Mackenzie and Moncur, who also executed that at Sandringham Church. Mr. Geo. Riches, of Dersingham, restored the fabric of the building, Mr. John Boddy, of Harpley, being responsible for the roofs, floors, and internal fittings, and Mr. A. W. Hall, of Norwich, reinstated the ancient stonework, and executed the new masonry throughout. Sir Arthur Blomfield, of London, has acted as consulting architect, and the work has been carried out from the designs and under the superintendence of Mr. Herbert J. Green, of Norwich.

STAFFORD.—On Friday the Bishop of Lichfield attended a service at Castle Church, and dedicated a memorial aisle and windows which have been added in memory of the late vicars. The present edifice dates from 1844, when it was rebuilt, mainly through the benevolence of the late Mr. R. W. Hand, and at that time the plans, which were prepared by the late Sir Gilbert Scott, provided for the building of a north aisle. This work has now been undertaken and carried out from the same designs by Mr. R. Bridgman, of Lichfield, the architect being Mr. J. Oldrid Scott. The new aisle is 48ft. in length and about 15ft. in width, being separated from the nave by four Norman arches. The whole of the work is in keeping with the architecture of the church, and has been executed at a cost of about £850. The extra seating will accommodate 60 persons, and it is proposed to make a further extension in the course of time which will embrace an organ chamber and choir vestry. At the west end of the new aisle there is a lancet window of cathedral glass, and four memorial windows, representing the Four Evangelists, have been placed on the north side. The pulpit has been changed from the north-west to the south position, and the interior of the church is now lighted with gas.

A new Wesleyan church is being erected at Sheffield, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

An exhibition of drawings by students of the Bolt-court Technical School, which is carried on under the auspices of the London County Council Technical Education Board, is open to public view during this week, up to and including Saturday. The object of the school, of which Mr. Cecil Rea is the art director, and Mr. Gamble the school director, being to give instruction in the craft of producing surfaces for printing, the instruction comprises drawing, design, lettering, lithography, photographic copying, and the chief photo-mechanical processes.

## COMPETITIONS.

**WREXHAM.**—A special meeting of the Wrexham School Board was held on Friday to consider the award of the assessor on the plans sent in for the proposed new board schools for Wrexham. The competition was confined to architects practising in the town, and nine sets of plans were sent in. The assessor appointed by the board was Mr. W. E. Willink, F.R.I.B.A., Liverpool, and he awarded the first premium to Mr. W. Moss, Regent-street; the second to Mr. John Harris, Westminster-buildings; and the third to Mr. J. H. Swainson, Holt-street. The board asked for plans for accommodation for 1,000 children—400 boys, 300 girls, and 300 infants—and the entire cost, exclusive of building site, was not to exceed £8,000. Mr. Willink said they could not get what they wanted for the money, and he estimated that the first plan would cost £9,610 to carry out, and the others £10,995 and £10,607. The assessor's award was unanimously accepted, and it was decided the £30 premium be paid to Mr. Moss.

## STATUES, MEMORIALS, &amp;c.

**STATUE OF THE QUEEN FOR DURBAN.**—A statue of Her Majesty the Queen, recently completed by Mr. Hamo Thornycroft, R.A., has this week been on private view at the sculptor's studio. The work was commissioned by the Municipal Corporation of Durban, Natal, as a borough commemoration of the Sixty Years' Reign. Mr. Thornycroft undertook it in February last, and it is now finished, and will be shipped in the middle of next month. The statue, which is of Sicilian marble, is on an heroic scale, standing nearly 10ft. high. It represents the Queen as she appeared shortly after her accession to the Throne. Her Majesty wears a jewelled crown, and heavy State robes which fall over the back of the support. The Ribbon and Star of the Garter are shown, and the dress is richly brocaded. In the right hand is the sceptre, resting against the upper part of the arm, and the left holds the orb surmounted by a cross. The base has in the centre the letters V.R.I. linked together in a plain scroll, but is otherwise without ornament. The pedestal, which has already gone to Durban, is also of marble, and stands about 11ft. high. The total cost of the memorial will be over £2,000. The site selected is in the Town Gardens immediately opposite the portico of the Town Hall.

**ST. MARGARET'S, WESTMINSTER.**—A memorial to the late Sir Frank Lockwood, Q.C., M.P., has just been placed in this church, and has taken the form of a brass very elaborately engraved, and bearing the following inscription: "To the memory of Sir Frank Lockwood, M.P., sometime Solicitor-General, born 1846, died 1897, whose qualities of head and heart, adorned by an unflinching, yet unassuming humour, endeared him to all parties in the House of Commons. This tablet is erected by his sorrowing friends in both Houses of Parliament." At the desire of the Committee the work was placed in the hands of Messrs. Percy Bacon and Bros., 11, Newman-street, W.

## CHIPS.

The Duke of Devonshire will visit Derby on the 19th inst. for the purpose of opening the new municipal technical college, erected by the corporation at a cost of £40,000.

Dr. Baccelli, Minister of Public Instruction in the Italian Government, has ordered the immediate evacuation of three halls in the Doge's Palace at Venice, which, if danger of collapse is to be apprehended, would be the first portions of the edifice to be imperilled. The whole library of St. Mark's will then be removed into the rooms of the Zecca.

The partnership hitherto subsisting between F. H. Lancaster and H. W. Rogerson, architects and surveyors, Boscombe, Bournemouth, under the style of Lancaster and Rogerson, has been dissolved.

At the Birkbeck School of Art, an exhibition of the work done by the students during the past session has been on view during this week. There was a total of 304 students, and by these 266 certificates were obtained from the Science and Art Department. In the National competition a large percentage of works from this school were selected for examination, two silver medals and ten book prizes being awarded.

The foot-bridge over the lines to the eastern end of Truro station is being completed. The two large girders were placed in position on Sunday morning, the travelling crane lent by the Great Western Company to the contractor for that purpose being used successfully. The work was watched by Mr. Fox, resident engineer of the railway company; Mr. A. Carkeek, the contractor; and a representative of Messrs. Lysaght and Company, sub-contractors for the ironwork. The station itself is in course of reconstruction.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

**ARTHUR RADCLIFFE.** (Write B. T. Batsford, 94, High Holborn, W.C. He will recommend a selection, including Rivingtons, and probably supply same at second-hand prices.)

**RECEIVED.**—W. L. S.—M. F. and Co.—G. I. P.—H. P.—S. W. K. (Bristol).—A. N. and Sons.—W. K. G.—R. E. Co.—G. C. H. (Manchester).—T. F. L.

## "BUILDING NEWS" DESIGNING CLUB.

## FOURTH LIST OF SUBJECTS.

**D.**—A Village Tavern situated by the road-side in the main street, with a frontage of 48ft., the ground line falling from left to right 1 in 12. The elevation to set back 15ft. from the rear line of pavement; but a porch or bays may project from the building not more than 6ft. The adjoining houses are plain 18th century brick ones, 26ft. high to top of parapet. A carriage entrance, 10ft. wide, must be contrived leading to the stable-yard in the rear. The new building to comprise ground floor, first floor, and second floor. The top rooms may be partly in roof. The accommodation to include a good, sufficiently ample public bar, a smoke-room, a good, spacious stairway, 4ft. wide, leading to club or meeting room about 32ft. long by 20ft. wide, or of that area on the first floor. There must be a billiard-room for two full-size tables on the ground floor, and a "tap-room" leading out of the stable yard. The stables and coach-house need not necessarily be drawn in. The residence connected with the tavern to comprise a sitting-room to the rear of the bar, a good ample kitchen, scullery and offices, five bedrooms, bath-room, and w.c. Sanitary accommodation for customers must be arranged in the yard premises; but it is essential to keep the house and its buildings distinct from the public part of the establishment. A retiring-room in conjunction with the big room on first floor is necessary, also a rolling-way and hatch to the cellars below. The elevation is to extend the whole width of the site in front, and must include the 10ft. way already mentioned. The forecourt to be inclosed with posts and chains. A sign of the "Red Lion" is to form part of the design. Style, "Later Renaissance," in red brick mainly, with stone sparingly used. An old-fashioned-looking tavern is required, not a modern gin-palace. Tiles for the roof. Parts may be plastered. Scale, 8ft. to the inch for elevation, and two sections, plans 16ft. to the inch if desired. There must be a sketch view.

**DRAWINGS RECEIVED.**—"Le Nord," "Astragal," "Arc," "Rikki," "Butts," "Balbas," "Hoopoe," "Alexam," "B. Gyn. R.," "Espoir," "Swan," "McGilligan," "Jabez," "Bat," "Scruton," "Quadrant," "Tokio," "Thistle," "The Old Firm," "Pup," "Casual," "F," "La Poupee," "King Crow," "Carlo," "Jonnie," "Bedouin," "Gurgyle," "Athos," "Vigornia" (these two last came very late).

## Intercommunication.

## QUESTIONS.

[12150.]—**Level.**—Which is the most useful and handiest level to use in such works as taking levels of building sites and so forth? A level is wanted that could be carried about readily in the hand, and great accuracy would not be so much a requisite as portability and speed in use.—W. D.

[12151.]—**White Flooring.**—Many thanks to "G. H. G." and "L. E." for noticing my query. From their replies it appears to me that, as far as decay is concerned, there is really very little difference between red and white wood flooring. I have seen a good many red deal floors, but never to my knowledge have I seen one entirely free from bright sap (not green sap) on the edges of the boards. For this reason, seeing that the white flooring is generally more free from sap than the red, it should be equally lasting, but is more liable to strip with wear and tear than red wood. Is not this the real reason of its being less frequently specified for ground floors than red flooring?—ENQUIRER.

## REPLIES.

[12148.]—**Moving Brick Houses.**—The buildings have to be securely tied and strutted so that there is no danger of them falling to pieces. Some time since there was an article in the *Strand Magazine* showing houses in the course of being moved. You might gain some hints if you could look up that article.—L. E.

[12149.]—**Value of Brick Earth.**—It is almost impossible to say the value of the earth you have. The best way is to see what offers you can get for it.—L. E.

## LEGAL INTELLIGENCE.

**ARBITRATION AWARDS.**—The awards in several important compensation cases recently reported in our columns have been issued. In the case of "Penreth v. Great Central Railway Company" (reported in the BUILDING NEWS for November 18, p. 735), a claim for compensation for land taken from the Thorpe Mandeville Estate, a hunting-box in Northamptonshire, and for depreciation of the rest of the property, Mr. Robert Vigers, president of the Surveyors' Institution, awards the claimant the sum of £2,065. Mr. Alexander R. Stenning, sole arbitrator in the case of "Gregory v. Staines Reservoirs Joint Committee" (reported in our issue of Dec. 2, p. 807), has awarded £2,313 in respect of an easement through Rivernook Park, Wraysbury, near Staines, required for the purposes of an aqueduct from the Thames to the new reservoirs at Staines. In "Milledge v. the School Board for London" (reported Nov. 4, p. 665) Mr. Robert Vigers awards £830 in respect of a total ground-rent of £26 per annum derivable from four houses in Marriot-road, Tollington Park, N. In the case of "Lewin, Gregory, and Anderson v. H.M. Office of Works" (also reported by us in our issue of Nov. 18, p. 735), a claim in regard to the acquisition of office premises, No. 13, King-street, Westminster, for the purposes of the Parliament-street improvement, Mr. Arthur Cates awards the claimant £2,800, inclusive of compensation for interference with the business by removal.

**RE SAINT OSWALD PENNINGTON.**—The liabilities in this case, that of an architect and surveyor, of Lichfield-street, Wolverhampton, are set down at £261 5s. 2d., and the deficiency is estimated at £246 5s. 2d. The bankrupt was formerly in business at Southport, Ramsey, and Douglas (Isle of Man), and afterwards at various towns in England. In 1893 he went to Darlaston, and later on to Wolverhampton. Since March last he has been continually sued by his creditors. The whole of the furniture is claimed under a marriage settlement.

## CHIPS.

The new mission-hall at East Grinstead was opened on Tuesday. It has been erected by Mr. H. Young, from plans by Mr. H. E. Mathews, of the firm of Messrs. Douglass Mathews and Son.

At the Guildhall Justice Room on Tuesday, James H. Barker, timber merchant, formerly of High-street, Leyton, was charged with obtaining credit to the extent of £759 from Messrs. Whiting and Manning, timber merchants, St. Mary Axe, without disclosing the fact that he was an undischarged bankrupt. Evidence having been given for the prosecution and defence, the defendant was committed for trial.

The Empress Frederick of Germany opened on Friday the Diamond Jubilee wing, which has been added, at a cost of £8,000, to the Royal Sailors' Rest at Portsmouth. In the new wing, which is of red brick with dressings of Portland cement, 112 sleeping cabins are provided, and there are now altogether 450 sleeping-cabins at the Rest. There are stores for bicycles, club-rooms, and work-rooms for the sailors' wives. The wing and main building are connected by a bridge carried across the street. Mr. H. J. Snell, of Plymouth, was the architect, and Mr. J. H. Corke, town councillor of Portsmouth, the builder.

## Our Office Table.

"£1,500 A YEAR GOING A-BEGGING" is the title of a sensible letter from Mr. Horace T. Bonner, A.R.I.B.A., which appeared in Wednesday's *Daily Mail* on the subject of the difficulty the London County Council are experiencing in finding a successor to Mr. Thomas Blashill. He points out the unfair treatment awarded to the nine selected candidates for the post, who have now been passed over, and emphasises the inadequacy of the salary offered—no more than that given to the superintendent of tramways. "This," he remarks, "is hardly a compliment to the profession of architecture—the mother of all the arts"; but until a Bill is passed by Parliament for the registration of architects (which for some absurd reasons the Royal Institute of British Architects have always opposed) the members of the profession will be treated as upon the equality of a horsekeeper."

SIR WILLIAM B. RICHMOND, R.A., speaking on Saturday at the annual exhibition of the Hammersmith School of Art, said that he entertained great hopes of the study and practice of the decorative arts in England rising even to greater eminence than had been the case in the past. All, however, depended upon whether the general public wanted better work or not. Certainly there had been deterioration, but he believed that a reaction was now setting in, and this was probably because it was found absolutely necessary for English goods to be of the best possible quality. The tendency in recent years with regard to art seemed to have been too theoretical, but if art in its highest sense was to come back to England, and shine as it once did, much more attention would have to be given to practical training. The general artistic taste of the people of this country was enormously improving, and we were now far in advance of France and Germany in this respect. It would, however, be a long time before we reached the high ideal which many of them desired to see realised. He concluded by urging those present to support the vestry in the endeavour to establish a much larger art school and technical institute in Hammersmith.

An interesting addition has been made by Sir Benjamin Baker and the Sewers Committee of the Corporation to the fine collection of relics of the London of the past which lie beneath the present city, gathered by the late Mr. Charles Roach Smith. The Roach Smith collection is exhibited in the Guildhall Museum, and these have now been placed beside them. Most of them were found during the excavations in progress for making the Bank and Newgate Stations of the Central London Railway. Among them are an engaged brass rowel spur of the 17th century, a portion of a horseshoe of Celtic pattern, some specimens of Samian ware, a Venetian wine-glass, a plate of painted Delft ware of the 17th century, and other fragments. At the corner of Queen Victoria-street, near Walbrook, were dug up some Roman antiquities, and these have also been included, along with a curious cast-iron plaque from the cellar of an old house in Smithfield.

A BILL will be introduced into Parliament next session by the Liverpool Corporation comprising 25 clauses. Power is sought to widen (1) Scotland-road on the west side between Bevington-bush and Bevington-hill, (2) Park-road, Toxteth-park, on the west side between North Hill-street and Ellis-place, and (3) Vauxhall-road, on the east side between Freemason's-row and Marybone. The estimated cost of these improvements is put down at £250,000, which includes the purchase of the necessary lands, which must be acquired within three years from the passing of this Bill. By clause 15, the corporation seek power to borrow a further sum not exceeding £350,000, of which £250,000 will be expended upon the proposed street improvements, and £100,000 for library and museum purposes.

A COURSE of architectural engineering has been inaugurated this week at the Massachusetts Institute of Technology. It is a branch of the regular course in architecture, diverging from it only at the beginning of the second term of the third year, when students who desire to qualify themselves for the science, rather than the art, of building, discontinue academic design and some of the purely artistic courses, and take up, instead, advanced applied mechanics and the theory of structures, as applied particularly to

modern buildings, devoting themselves to the design and computation of columns and girders, trusses, arches, foundations, and fireproofing; and, in the fourth year, taking up laboratory tests of the strength of building materials. Besides the undergraduate students who elect this option in place of the regular course, it is proposed to admit graduate students, many of whom, it is thought, will avail themselves of the opportunity to reinforce their general knowledge of construction with the study of the most difficult problems presented by modern buildings.

IN order to prevent the yellowing of the coatings in water-closets, stables, &c., where the exhalations are so strong that the paint turns yellow in twenty-four hours, no white-lead paint should be employed, says the *Deutsche Malerzeitung*. Use only zinc-white with a suitable mixing colour, thinned with turpentine and water. It is true zinc-white is also attacked by strong exhalations, but not in such a degree as white-lead, which even under wood-colour becomes black and spotted in a short time.

THE New York Reform Club Committee have reported upon the reforms effected in cleaning the streets of that city. It is shown that the ease with which certain types of pavement can be kept clean, as indicated by careful observations of the cost of doing the work, is as follows: Asphalt, 100; brick, 100; wood (smooth karri), 100; granite, 150; Belgian blocks, 160; cobble stones, 400. All the pavements were in good condition, and the accuracy of the table was checked by comparison with the number of sweepers actually employed in each subdivision in the city. For the entire city, 1,623 sweepers were employed, each sweeper keeping clean an average of 5,746 square yards, at an average cost of 2-4d. per 1,000 square yards a week, indicating that asphalt, brick, and smooth karri wood paving could be kept clean at 69 cents per 1,000 yards per week. A brick pavement, when properly laid, is, the report asserts, not a noisy pavement; it is a good and smooth road for traction purposes or for bicycling, while it affords a better foothold for horses than asphalt does; it is more than ten times as durable, it is lower in first cost, incomparably lower in cost of maintenance, and, in the cost of cleaning, the brick pavement is in no way inferior to asphalt.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Award of Prizes and Studentships. 8 p.m.  
Surveyors' Institution. Adjourned discussion on "The Official Supervision of Buildings in London." 8 p.m.  
Bristol Society of Architects. "Rhythm in Design," with illustrations, by F. Bligh Bond, F.R.I.B.A.  
Leeds and Yorkshire Architectural Society. "Byzantine Architecture in Constantinople," by A. E. Henderson, A.R.I.B.A. 8 p.m.  
TUESDAY.—Perth Architectural Association. "The Abbeys in the Stewartry of Galloway," by Edwin Forbes, of Edinburgh. 8 p.m.  
WEDNESDAY.—Society of Arts. "Some Ways in which Animals Breathe," by Prof. F. Jeffrey Bell, M.A. 7 p.m.  
Northern Architectural Association. "Architectural Studies in Yorkshire," by G. B. Bulmer, F.R.I.B.A., of Leeds. 7.30 p.m.  
Edinburgh Architectural Association. "Explorations in Palestine and Jerusalem," by A. C. Dickie, A.R.I.B.A. 8 p.m.  
THURSDAY.—Dundee Institute of Architecture. "Exploration in Jerusalem," by A. C. Dickie, A.R.I.B.A. 8 p.m.

## Trade News.

### WAGES MOVEMENTS.

PAISLEY.—Paisley master painters have intimated to the secretary of the Operatives' Society their concession of an advance of a halfpenny per hour in wages. The increase came into force on Monday.

Mr. George Henry Andrews, F.R.G.S., the late treasurer of the Royal Society of Painters in Water Colours, died on Saturday, at his residence in Dorville-road, W., aged 82 years.

A memorial brass to the memory of the late Lord Plunket, Archbishop of Dublin, a companion one to that erected in memory of Archbishop Trench, was unveiled on Friday afternoon by Archbishop Peacocke after a special dedication service in Christ Church Cathedral, Dublin.

## AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2297.

FRIDAY, JANUARY 13, 1899.

### BUILDING PROGRESS AND IMPROVEMENTS.

IF our architectural progress were to be gauged by the extent of demolition that has taken place during the last year, we should indeed have little to complain of. During the last two or three years there has been a vast clearance made of old houses, and in their place have arisen rows of shops or offices, new, and with better sanitary arrangements, but depressing in their monotony, and wanting in character. These newly rebuilt neighbourhoods represent to the eye of the spectator the origin and intention of the promoters—a scheme of demolition and reconstruction in the speediest and most economical manner. A vast area of old buildings is cleared without any discrimination or sympathy by Act of Parliament, and the area is as quickly built over by regulation buildings. It is an Act of Parliament scheme, and when completed it looks nothing else.

We may mention as instances of demolition and reconstruction the areas round Covent Garden, Clerkenwell, Cripplegate, the scene of the late fire, the demolition of houses in Parliament-street and Whitehall for the New Government Offices, changes that have completely altered the surroundings of these places, as in the setting back of Parliament-street, and the better approach to the Abbey and Houses of Parliament. Simply as works of opening out and removal of crowded and insanitary areas, these demolitions are in most cases beneficial. The buildings pulled down were generally of no historic interest or architectural value, and London is none the worse for their removal. Demolition, however, does not mean improvement; it often leads to stagnation or devastation simply because no well-considered scheme takes its place.

Within our time we almost despair of seeing any comprehensive scheme of new arteries or widening of old streets, like the Strand, Fleet-street, and Piccadilly, much less of any new streets traversing London from east to west, proportioned in width to the demands upon them at different parts. Sir Wolfe Barry's paper on the "Internal Traffic of London," we reported in November last, gave a sketch of what all Londoners have been asking for for years—a provision for north and south traffic either by tunnel or overhead so as not to interfere with the east and west traffic, which crossings could take points like Piccadilly-circus, Wellington-street, Ludgate-hill. No mere crossing old by new streets will now be adequate; the subject is one that will require engineering skill to be brought to bear upon it as well as architectural arrangement and planning. Underground and overground structures will alone meet the requirements, which become more numerous and difficult every year.

Several street alterations have been made that are improvements. One of them is the widening of the Oxford-street end of Davies-street, and therefore an improvement of the approach to Berkeley-square, and to a fashionable quarter. The opening of a station in Davies-street for the Central Electric Railway will be an important step towards bringing the heart of the City and its business within easy reach of the leisured denizens of Mayfair, and help to remove another of the barriers that divide the mercantile and business from the fashionable parts of the Metropolis. In quite

another district on the south side of Thames an important street widening has been undertaken—that of Long-lane and Tabard-street, Southwark — by forming branch approaches from the Borough High-street on each side of the old church of St. George the Martyr. The Tower Bridge approaches will entail a large demolition of houses of the working classes. The widening of Old-street, St. Luke's; of Southampton-row from Holborn to Hart-street; and the Albert Embankment widening are a few of the minor improvements about to be undertaken or now in progress. Are we sure that all the new frontages or rebuilt areas will be dealt with as they ought to be? Will the designs be submitted to a committee competent to judge of elevation, and the effect upon existing buildings often at acute and awkward angles with the line of new street? These are questions upon which the result will depend.

It may perhaps be doubted whether the acquisition of more land than is required for making a new street or widening one—the "Recoupment system" is really beneficial, as in some cases the sums realised by the acquired property do not equal the amounts paid for leasehold and trade interests and forced sale. The one advantage of the recoupment plan is, however, that the Council can command the whole frontage, and, therefore, ought to be in a position to require buildings erected of good architectural design. But the fact is that the statutes have only regulated frontages, projections, and heights, and these are somewhat detrimental to bold and effective architecture. Statutory enactments rather favour uniformity and monotony by prohibiting projections and salient features. Every new frontage should have its own appropriate features, to harmonise or contrast with the older buildings. Mansard roofs, boldness of recess, turrets are features that in each case may be decided upon by a committee with advantage, and the elevation should be, as far as possible, intrusted to architects of ability. In this way the architectural features and general design of a street might be preserved from incongruous or commonplace treatment.

If we turn to a few of the new buildings of a public character, we shall find a great variety: two or three large hotels have been erected, rivalling each other in architectural pretensions and luxurious appointments. The new Claridge's Hotel at the corner of Brooke and Davies Streets is a red brick building of pretentious character, and the newly-completed Carlton Hotel in the Haymarket completes the palatial block of which the late Mr. Phipps's theatre forms one wing. These are of stone, and the hotel façade is most elaborately carved. The skyline is broken by cupolas and dormers, gables; but the building lacks both breadth and boldness of detail, and when smoke has done its work the façades will become flat and uninteresting. Another large and lofty hotel is erected next the Empire Theatre in Leicester-square. The Cecil and all the larger buildings of this class suffer from a desire to compete in external splendour at the cost of other qualities. The new block of the Record Office in Chancery-lane is massive, and picturesque in outline, though in a now somewhat defunct Tudor style. In Fleet-street new commercial offices and banks have been erected, but of not very marked character. Further west, the new buildings designed by Mr. Alfred Waterhouse, R.A., for the Institution of Surveyors in Great George-street, the imposing, but too broken, façade of the Institution of Mechanical Engineers facing the Park, show the prosperity of our professional societies, who have now "local habitations" worthy of their names. Some progress has been made in theatre building. The last year has witnessed the erection and opening of several playhouses in the suburbs. At Peckham the Crown

Theatre, recently described by us, evinces a truer conception of theatre planning and design, the architect, Mr. E. Runtz, using red terracotta effectively and broadly in the main front. Of the recently opened Kennington theatre, the "Princess of Wales," the site is exceptional, and a large stone-faced building with two imposing sides has been built, of French Renaissance character, the long flank to the park being the least satisfactory portion, badly harmonising with the plain, red brick Episcopal residence adjoining. Theatres of variety have also been built at Brixton, Hammersmith, at Notting Hill, and other suburbs which prove the rapid growth of those districts and their demand for buildings of this kind. The decentralising influences of separate municipalities, and especially of the effect of increasing distance and difficulties of transit from London, have created the desire for independence. These are influences which ought to benefit the profession. Buildings for technical institutes and municipal offices, like those of West and East Ham, libraries and schools and theatres, will be wanted, and we should like to see local and suburban talent employed more often than has yet been the case.

The completion of the City and Waterloo line and the progress made by the Central Electric Railway are two of the most notable works that have been accomplished in engineering during the year—important as indicating the advancement made in tunnelling by new methods. We have lately described the construction of these tunnels and the excavating machinery. In the new Vauxhall Bridge, designed by Sir A. R. Binnie, segmental concrete arches pivoted in the centre and springings, and of about 150ft. span, with concrete piers faced with granite and rock-faced voussoirs to the arches, are the chief features, and the designer has availed himself of spandrels of the same material, pierced by longitudinal arches, which considerably lighten the arch loads—a method of construction we noticed in this journal many years ago.

### MODEL SPECIFICATIONS.—XLVII.

#### SANITARY AND WATER-SUPPLY DETAILS AND FIXTURES.

AS to sanitary closet-fittings, valve closets with indiarubber seatings are more reliable than brass ground-in seatings. The valve should open sharply and fully to allow the body of water to pass down in one unbroken mass into trap. The overflow should be deep and well trapped so as not to be easily unsiphoned. The best arrangement is to place the overflow so that it may be protected by the valve when it opens. In many inferior closets the valve opens so as to allow the soil to foul the overflow. An air vent-pipe should be taken from the valve-box so as to ventilate the space between valve and trap, and some join the basin overflow into the air-pipe, by which the overflow-trap is protected. The valve closet-trap may be above the floor-line; but care should be taken to make a good connection with the soil-pipe, and the trap is for many reasons better independent of closet. The lead safe-trays should have 1½ in. wastes to open air, with copper flap-valves.

Care is necessary in specifying housemaids' slop sinks; they should not be fixed too near a bedroom. The waste-pipe should be of 10lb. lead at least, to resist action of hot and cold slops; its diameter should be 3 in., and be carried into a 3 in. down-pipe, the end of which should discharge into a disconnecting trap. The sink may be of glazed pottery or enamelled iron, square shape, with rounded corners and sloped bottom. The housemaid trough should be fixed next the slop-sink, and on higher level, with waste and overflow delivering over top of sink. White enamelled earthen-

ware troughs are the best, about 2ft. 6in. by 1ft. 2in. Some have a can rest hinged over. Lead safe trays should be placed under slop-sinks of 5lb. sheet-lead, turned up 6in. all round, with a 1½in. waste-pipe taken through wall with copper flap. There should be a flushing tap and a rinsing tap.

Many varieties of lavatories are in the market, and these are best selected from well-known manufacturers like Messrs. Doulton, Dent and Hellyer, Young and Marten, Nicholls and Clarke, &c., and the p.c. sum stated. The waste-pipe and trap should be 1in. diameter, and a 1in. round-way cock be provided between grating and trap, with handle and lever brought through the front casing. Provide ½in. hot and cold supplies through special horns on each side of basin, discharging through a flushing rim, and with ½in. lever or screw-down valves, the handles coming through casing. Provide also overflow to open air, and a lead safe tray.

Washstand basins are made in pottery and

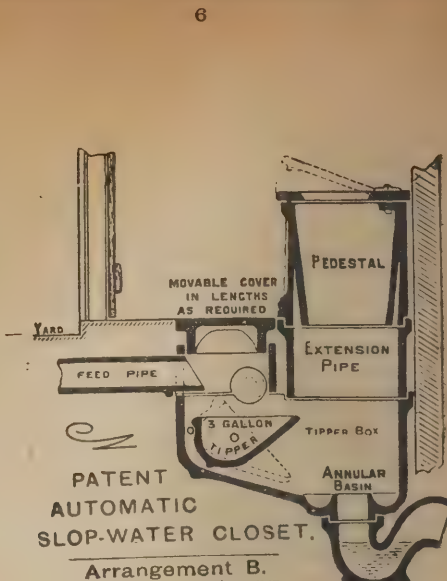

earthenware, round, oval, D-shaped, square. The D-shaped basin is a good form, and is often made for corners of rooms. Some lavatories are placed on hinged iron brackets. Tip-up lavatories are also much used.

There are several kinds of baths—lead-lined, zinc, enamelled earthenware, cast-iron, and copper are in the market, and the architect should consult the catalogues of well-known firms like Young and Marten, Nicholls and Clarke, Doulton, Jennings.

Copper baths are the best and most durable; enamelled earthenware baths are also clean and smooth, but they occupy more room, and are heavy, and cast iron is liable to oxidise, even when japanned, but for cheapness and durability cannot be surpassed. They should be well painted with a varnish paint. The ordinary size for a reclining bath is 5ft. 6in. long at top, 4ft. 6in. at bottom, 2ft. 3in. deep. It is better, writes Mr. W. R. Maguire, if the water companies' rules allow, to bring the hot water supply to one side and the cold water in opposite near the foot, and about 3in. over the bottom, through large brass gratings, the overflow being taken from the foot, about 3in. from the top, with a large grating.

The waste-pipe and valve should be 2in. diameter, heavy of lead pipe, trapped beyond valve with deep siphon with cleansing screw. The overflow to be connected below the valve, and a 2in. vent-pipe be put to protect water-

seal of trap from outgo to open air. Specify that no connection is to be made between the bath waste-pipe and soil-pipe.

In large establishments where there are several baths, a separate supply may be necessary.

Our first sketch shows the connections of a stack of w.c.'s with soil-pipe, also an anti-siphoning 2in. or 3in. lead pipe shown inside wall, with branches to all traps. The other sketches show different kinds of ventilating intercepting traps to be used to connect soil-pipe or house drain to the sewer. Many very efficient traps are on the market, such as the "Kenon" "Disconnecting" trap, Buchan's, Hellyer's, Duckett's, Winsor and Co., &c.

45. *Lead Supply to Closets.*—Connect cistern with 1½in. brass union, 1½in. above bottom, and take down to upper floor closet, 1½in. lead supply with stop-cock near cistern, and to closet on second floor, thence by 1½in. pipe to valve-closet on first floor, and 1in. pipe to ground-floor valve-closet. Provide a stop-cock to each closet near valve. Connect waste-water preventers with ½in. lead pipe to servant's closet and slop-sink in basement.

46. *Valve-Closets.*—Provide and fix to all floors except basement Doulton's (or Hellyer's) best white-ware basin closets, with copper regulators, with 1½in., 1½in., and 1in. supply unions respectively, with stop-cock to each. Ventilate each valve-box with 1½in. air-pipe, finished at outer end with brass grating. Connect siphon trap to 3½in. pipe arm branched into 3½in. lead soil-pipe, 8lb. to the foot, with "wiped" joints, securely fixed with 6lb. lead tacks to wall.

The soil-pipe to be connected to stoneware drain according to L.C.C. regulations, or as shown, and to be carried up the full bore 5ft. above eaves, with copper rose at top. (For anti-siphonage pipe and branches, see Clause 31.)

47. *Water-Waste Preventers.*—Provide and fix to all wash-out or pedestal closets an approved water-waste preventer (or Doulton's patent "Paisley"), two-gallon flush (or a siphon-action two or three gallon preventer), with fittings and connections complete, on iron brackets, with galvanised-iron or brass chain, and cased in with deal and felt packing. Carry a 1in. overflow arm through wall, and finish with copper flap, and take a 1½in. lead discharge-pipe to closet pan, with rubber connection or otherwise. Or—

Provide and fix to each wash-out closet Young and Marten's "Eureka" cast-iron siphon waste-preventing cistern, two gallons, with chain and pull galvanised, p.c. £1 9s. 0d.; or "Despatch." Or—

Provide to each closet Nicholls and Clarke's "Premier" water-waste preventer, passed by the New River Co., p.c. 17s. 6d.

48. *Sewer Gas Interceptors.*—Provide and fix in position to receive house-drain one of Doulton's 6in. improved sewer gas interceptors (if white enamelled inside, state); or list No. 21 H, with galvanised iron grating for ventilating socket; or Doulton's No. 38 trap for soil-pipe, with easy bend, and outlet from 4in. to 6in. Or—

Provide and properly fix the "Kenon" 6in. interceptor, with long inspecting arm, fitted with movable cap, p.c. 16s. (or Doulton's interceptor

trap, with inspection arm and channel inlet, 6in. diameter, No. 59 in list, with air-tight stopper, complete with Stanford's patent joint to inspection socket, or p.c. 12s. 6d.) Or—

Provide and properly fix at foot of soil-pipe Cregeen's patent air-inlet, to be supplied by Doulton and Co., for 6in. shaft (see sketch 1). Or—

Fix complete, in a workmanlike manner, Hellyer's patent interceptor (see section 4), with 6in. siphon and 15in. galvanised iron grating, properly bedded in concrete to receive house-drain.

The following clauses relating to house-drainage are given in Taylor's "Sanitary Inspector's Handbook":—

49. *Soil-Pipes.*—The soil-pipes to be of the best socketed 4in. cast-iron pipes of the weight and thickness given (or ¾in. thick), and of the weight of 1qr. 20lb. per 6ft. length, properly connected to the drain, and jointed with spun yarn and Portland cement put to stoneware drain-pipes, and spun yarn and molten lead if cast-iron drain-pipes, well caulked.

The iron soil-pipes to be coated with Dr. Angus Smith's solution or the Bower-Barff process inside and outside, and afterwards painted outside with two coats of good oil-paint.

The pipes to be screwed to the walls with detachable wrought-iron clips, screwed to 14in. by 6in. by 2in. wood grounds or blocks, chamfered, painted three coats, and nailed to a sufficient number of plugs inserted in the joints of brickwork.

50. *Anti-siphonage Pipes.*—The soil-pipes to be provided with lead anti-siphonage pipes, 2in. in diameter, fixed to top of trap of each w.c., and carried up as provided for soil-pipe ventilators.

51. *Lead Soil-Pipes.*—Lead soil-pipes must not be less than 3½in. internal diameter, and of solid drawn 8lb. lead, with properly wiped joints, wiped full 3½in., and to be socketed ½in. All such pipes to be secured to wall every 6ft. in length by means of a pair of 8lb. lead tacks, having three wall-hooks and plugs to each tack. There must be inserted between the lead soil-pipe and the stoneware or iron drain a brass ferrule; the joint of soil-pipe with the drain to be made as specified in the case of iron soil-pipes.

52. *Ventilation of Soil-Pipes.*—All soil-pipes must be ventilated by means of pipes the same diameter, carried at least 3ft. above the eaves or any window or other opening within 20ft., measured in a straight line from the open end of ventilating pipe. When no soil-pipe exists, a special 4in. cast-iron ventilating-pipe shall be carried up, as provided in the case of soil-pipes, from the highest point of the drain, the open end of such soil-pipe or ventilator to be protected by a galvanised wire guard of the full section of the pipe.

53. *W.C. Connections.*—All stoneware traps of w.c.'s to be connected to lead soil-pipes by means of a brass socket, properly fixed. The joint between the lead branch and the soil-pipe to be outside the wall, and where iron pipes are used, the joint between the lead arm and the iron soil-pipe shall be constructed with a brass ferrule.

54. *Urinal Wastes.*—All urinal waste-pipes to be of good drawn lead, 2in. to 3in. diameter, and to be trapped immediately under the bowls.

55. *Lavatory, Sink, and Bath Waste-Pipes.*—All lavatory, sink, and bath waste-pipes should be of drawn lead, from 1½ in. to 3 in. diameter. Each pipe to be trapped and furnished with ventilating pipes, should the wastes be more than 10 ft. in length. These waste-pipes should be constructed so as to discharge either over or under the grating of a trapped gully in the open air.

56. *Lead R. W. Pipes.*—Lead rain-water pipes to be of solid drawn 6 lb. lead, and secured to the wall with lead tacks of 6 lb. lead, or suitable iron holdfasts.

57. *General.*—The workmanship and material to be the best of their several kinds, and the whole of the work to be done in a workmanlike manner, and to the satisfaction of the architect. Or—

*To be Done to Architect's Satisfaction.*—The work shall be carried out and performed in a good and workmanlike manner, with all true expedition, and to the full intent and meaning of this specification, and in accordance with such instructions as the contractor may from time to time receive, and every drain must be constructed to the precise instruction directed. The decision of the architect upon all doubtful or disputed points shall be final and conclusive.

58. *Stoneware Sink.*—Provide and fix in kitchen (or scullery) Doulton's stoneware sink of strong vitrified ware, with smooth glazed surface of cream colour, with countersunk hole for waste, 2 ft. 6 in. long, 1 ft. 7 in. wide (p.c. 10s.).

Provide in the butler's pantry Doulton's butlers' sink, with black printed ornament, 25 in. by 16 in., and 10 in. deep (p.c. 25s.).

The scullery sink to be supported on Duckett's glazed ware patent sink supports, 17 in. projection from wall, with rebated wood studs for door.

The sinks to be provided with Duckett's sink fittings, with brass grate set in cement, with trap and curved 2 in. waste pipe through wall, jointed with Stanford's joint, and with iron shoe at outer end complete.

59. *Slop W. C.*—Provide and fix complete Duckett's patent "automatic slop-water closet" (arrangement B) in yard, flushed by the slop-water from sink, with tipper and P-trap, and lay 4 in. inlet pipes from dishstone under sink-waste to closet (see sketch 6). Also provide to slop-stone Duckett's slop-stone pipe protector and gully (No. 3 A in catalogue). Or—

60. *Self-Cleansing Gully.*—Supply and fix in yard Duckett's "self-cleansing channel gullies," 28 in. by 11 in., of salt-glazed earthenware, with sloping grates, p.c. 7s. 6d. (There is a 2 in. earthenware waste-pipe and a trap that can be turned in any direction to suit drain. It conforms to by-law of L.G.B.) Or—

61. *Gully Channel.*—Provide and fix Doulton's "gully channel," 2 ft. long, with wire cover, to take waste-pipe from bath or sink, made of glazed stoneware.

62. *Lavatory Basin.*—Provide and fix on fir bearers at corner of lavatory a white or ivory best earthenware lavatory basin, dish for soap tray, &c. (or No. — in Doulton's list), with quick, full-way, screw-down ½ in. brass supply valves for hot and cold water, and 1½ in. pull-up brass quick waste valve and connect to cold and hot-water service with ½ in. branch supply pipes, and insert 1½ in. S trap to waste, connected to main waste with 1½ in. lead ventilating pipe from trap through external wall. Or—

Provide and fix a range of lavatory basins (state size) of white earthenware, of best or other quality (or No. — in list of Young and Marten), on ground or first floors, each to have a supply valve and quick waste of 1½ in., and with anti-D trap, connected to main waste by 2 in. pipe with brass cleansing cap and screw complete. Allow the sum of 18s. for the supply cocks, or state the particular fittings required. Or—

Provide and fix on proper bearers or brackets one of Doulton's (Lambeth) or Samuel Hunt Rowley (Swadlincote), earthenware lavatory basins, with dishes for soap and brushes, with skirting in one piece (state No. in catalogue), with pull-way screw-down ½ in. brass supply-valves for hot and cold-water, and 1½ in. brass pull-up quick-waste valve, and connect same to hot and cold-water service with ½ in. supply-pipes, and put in 1½ in. siphon (or auto-D) trap to waste, with ventilating-pipe complete, carried through wall. Or—

Provide and fix in lavatory one of Jennings' (or Nicholls and Clarke's) lavatories with polished mahogany casing, earthenware top, large D-shaped basin, with "hot" and "cold" yellow metal screw-down supply-valves, quick-waste pull, 22 in. by 20 in., p.c. £9. Or—

Jennings' patent "tip-up" and pull-out basins in enamelled slate (or polished marble), with hot and cold supply-cock, and all fittings complete, p.c. £3 3s. to £6 6s.

Allow sum of 12s. 6d. each for two silver-plated supply-cocks.

## THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. Geo. H. Fellowes Prynn, in the chair. Messrs. F. Mount, H. G. Turner, and J. M. Lethbridge were elected as members. It was announced that Mr. Hampden W. Pratt, treasurer and ex-president, had been appointed by the committee as a trustee of the A.A. Travelling Studentship, to fill the vacancy which had existed ever since the death, in April, 1890, of Mr. Ernest Claude Ayton-Lee.

### HOUSE PLANNING FROM THE AESTHETIC POINT OF VIEW.

A paper on this subject, illustrated by a number of plans of English mansions of the 17th and 18th centuries and other houses, specially drawn to large scale, was read by Mr. H. HEATHCOTE STATHAM. The author remarked that there was no branch of architecture more fascinating in its interest than the house, as it was the most intimately connected of all with the lives and characters of men. In an architectural sense, the designing of a house was not merely the arrangement of rooms so as to be comfortable in themselves and commodious in their relation to one another, though these were points of the greatest practical importance. That was a merely utilitarian view of the problem. The object of architecture was to raise the house to the level of a distinct and individual architectural conception or idea which should govern the whole arrangement; to give it as much of interior effect as was compatible with its size and with the practical convenience of internal traffic; to make it something more than a mere dwelling-place, the expression of an artistic thought—whole, complete, and indivisible. The plan was that in which the artistic idea of the house was really embodied; that was the basis of the whole; if there was a good idea in the plan even bad external detail could not entirely spoil it; if there was no idea in the plan—nothing beyond a commonplace collocation of rooms in convenient positions, the best exterior detail would do little or nothing to conceal the poverty of the main conception. In any case the treatment of the masses of the plan was half the problem; and there had been splendid plans which had not been made nearly as much of as they might have been in regard to exterior architectural effect; but it was mainly the plan which distinguished the house which embodied an idea from that which did not. Now in this respect among others, the Mediaeval revival, so vaunted at the time, had left an ill influence behind it. Since the Mediaeval revival people had been taught to regard the ordinary-sized dwelling-house plan as consisting merely of the fitting together of so many parallelograms of room-spaces, something like a puzzle map, the end of one abutting on the side of another, the angle of one projecting beyond the wall of another, so as to show where the rooms fitted to each other; the result being a plan that was no shape at all, and which could not be walled and roofed in under the guise of any formal and distinct architectural conception. This way of building was supposed to be "picturesque" and "truthful"; it was said to accord with the irregularities of nature. A house was not, however, called upon to accord with the irregularities of nature any more than a garden; it was an artificial creation, and should be treated as such. It ought to be something more than a mere collocation of rooms; it ought to be a plan conceived as a whole, the rooms designed and placed so as to be subordinate to that governing idea, while retaining convenience of internal position. That was just

### THE CRUX OF ARTISTIC HOUSE-PLANNING;

the mere irregular fitting of rooms together was an evasion of it. He was not arguing necessarily in favour of bilateral symmetry in the average-sized house, though in the majority of cases bilateral symmetry in the main masses at least with diversity in some details would produce the best architectural result. But at all events the house should be modelled on a distinctly conceived and predominating design which moulded the whole of it; not merely put together as the rooms might fit conveniently. In the attempt to give special character and unity of conception and design to houses of average size, both the Americans and the Germans were a good deal in advance of us, although he might add that he cordially hated

modern German architectural style and detail for the most part. He proposed to deal that evening with

### THE "MANSION" PLAN,

the treatment of plan in the largest class of houses—those dignified by the name of "mansions." It was here especially that the taste fostered by the Mediaeval revival had injured us. With the commencement of the Renaissance period came the age of the great symmetrically-planned mansions, first in the Elizabethan form of the quadrangle, next in the later Renaissance form of the main central block and the outlying "wings." In the Georgian period the wings disappeared and the symmetrical block alone remained; the accessory buildings, such as stables, laundries, &c., all being relegated to separate buildings at more or less distance from the house. Then after the Gothic revival came the idea that symmetry was not picturesque; there was a reaction against the formal plan, and next followed the taste for the rambling plan, in which the object apparently was to make it appear as if the plan had grown up by accident, or had arisen from the gradual enlargement of the house by successive additions. It was a nuisance to be losing oneself in a great house, and getting into the wrong rooms. But this was a minor consideration in comparison with the aesthetic one. It was often urged that the rambling and irregular house was the more homelike. But a mansion on the largest scale should aim at something more than homeliness. It was, to some extent, a house of state; it should aim at the qualities of stateliness and dignity. And it was here that the great charm of house architecture came in. Here there was the opportunity of combining architectural dignity with novelty and originality of grouping; the interest of arranging and shaping rooms so as to combine architectural effect with convenience. To adopt the rambling plan was to throw away a great deal of this opportunity. The lecturer sketched in some detail the house imagined by Bacon in his essay "On Building"—a quadrangular mansion approached by the courtyard, and suggested that it would not be a bad study for the Academy or the Institute to set as the subject of one of their prizes—the Travelling Studentship or the Soane Medalion—to

### RESTORE BACON'S MANSION

in plan, section, and elevation. Mr. Statham continued: Bacon deals only with the superior portions of the mansion: "as for offices," he says, "let them stand at a distance, with some low galleries to pass from them to the palace itself." This is really much the way they were placed by Vanbrugh at Seaton Delaval, only that Vanbrugh had them flanking the front or entrance courtyard of the house; masked by the colonnades, it is true, but still pretty well in evidence; whereas Bacon wanted them out of the way of notice altogether. The kitchens, he rather implies in his essay, would be in the basement of the main building. The quadrangle system of plan is no doubt one of the best for combining a considerable degree of architectural effect with a certain degree of retirement and domestic feeling. It is not the most effective for an exterior view, as in most cases one only gets the architectural impression of the front; nor is it the most wholesome form of plan in a sanitary sense. The E plan, with or without the centre shank of the E, gets over two of these objections, and, especially with a low screen or colonnade across the fourth side, is highly effective architecturally; but it introduces the new objection, for internal convenience, that each end of the returns is a *cul-de-sac*. Hatfield is a good example, and contains also a fine interior point in the long and wide gallery running from end to end of the principal mass and connecting the two largest rooms. Before long, however, the quadrangle plan was destined to give way almost entirely before that of the centre block and wings, and as a system of house-planning on a great scale nothing so grandiose has ever been devised. Vanbrugh, though he did not actually invent it, was the great high priest of this movement, the leading motive of which was, instead of hiding the offices away, as Bacon suggests, to make them contribute to the show. Vanbrugh had a great deal of the feeling of those who have been called sculptor-architects. At Castle Howard the lines of the balustrade fence on each side of the courtyard are modelled in and out in breaks and curves. This same modelling of wall lines is a point also with Wren.

Vanbrugh's great work is, of course, Blenheim, a plan of the grandest type, with its great terraced and cloistered forecourt, 250ft. long by 300ft. wide, and the kitchen and stable courts, each (with their surrounding buildings) about 250ft. by 200ft., opening from it to right and left. The plan is absolutely axial in both directions, two great longitudinal corridors running in parallel lines from wing to wing. The use of internal courts to light the corridors, which is sometimes regarded as a very modern expedient, is used here for the principal corridor at all events. The quadrant treatment connecting the wings with the centre is another example of Vanbrugh's modelling. It is one defect in the plan that the extreme right wing is one great gallery (180ft. long), and the corresponding left wing is divided up into rooms, though the exterior architectural treatment is identical in both cases. That is one of the pitfalls of absolute symmetry.

#### THE PRINCIPAL DEFECT OF BLENHEIM

is the want of a grand staircase appropriate to the grandeur of the plan. The main staircases, in two side halls, on each side of the great hall, are convenient enough, but these halls are only 11ft. wide, leaving only about 5ft. for the width of each flight; a miserable proportion for so great a house. At Castle Howard the staircases are planned in just the same way and of the same size. The architectural glory of a great staircase does not seem to have dawned on the mind of Vanbrugh. Turning to the most interesting and varied English Renaissance plans collected in the "Vitruvius Britannicus," we find all kinds of variations played on the idea of outstanding wings connected with the centre by colonnaded quadrants. At Roehampton House, by Archer, the quadrants are convex, and the front walls of the forecourt show that same kind of modelling in curves which seems to come naturally from Wren's pupil. In the plan of Eaton Hall, the general square lines of Seaton Delaval predominate, the stables and other offices flanking the courtyard without even being masked by arcades. At Beaconsfield (Millner), where the concave quadrant is again employed, the stable openings are round on the outer side, not towards the courtyard. In that remarkably stately modern plan, Mentmore, in like manner the kitchen wing fronts away from the house, and the back walls of kitchen and conservatory blocks, facing each other at each side of the forecourt, are made use of as decorative screens with niches for sculptures. The quadrant connection at Beaconsfield is badly managed, as it does not butt against the house block, but returns on itself, leaving an open end. At Hopeton House, Scotland (Sir William Bruce), the convex quadrant is again employed, this time better managed in its connections; the staircase occupies a fine position in an octagon hall in the centre of the house. At Lowther House, Westmoreland, we have an entirely original arrangement, the advanced wings ending each in an elliptical hall (the chapel on one side, the library on the other), the forecourt slightly raised and protected by a balustrade, and reached by a semicircular range of steps projecting outward at a 40ft. radius; the whole embraced by a range of arcaded cloisters on each flank, projecting beyond the forecourt. Braman Hall, one of Colin Campbell's own designs, shows a square block with two small wings connected on each side to the house by a lofty colonnade of three bays, with very bold effect; here, as at Blenheim, the outer blocks are the chapel and kitchen, treated identically. Castle Ashby, a courtyard plan by Inigo Jones, takes us back a generation, and has the staircases placed in projecting turrets at the re-entering angles of the courtyard. Eastbury, by Vanbrugh, is very much on the same lines as Seaton Delaval, with the square forecourt with arcades down each side to mask the stable and kitchen wings, and the same vast rusticated order to the house. Here Vanbrugh again uses his favourite arrangement of the two staircases one on each side of the central hall, but in this case he is more liberal to the stairs. At Seaton Delaval the stairs are provided in a projecting tower at each end of the main longitudinal corridor, the towers being square externally, but the stairs elliptical on plan. At Grimsthorpe Vanbrugh goes back to the quadrangle plan, and for once aims at a fine effect with his staircases, which are 8ft. 6in. wide in the lower flights and 7ft. in the upper, and placed within a double screen of columns at each end of a hall 125ft. long. At Burlington House the stable and

kitchen wings occupied the middle portion of each flank of the courtyard, and the court was closed by the two quadrant colonnades at the end opposite the house. At Houghton (Colin Campbell) the kitchen and laundry wings, connected by the habitual quadrant, are set back into the rear instead of being brought to the front, and the same is the case with the stable and offices wings at Duncombe Park (W. Wakefield), in which the quadrant is dispensed with. In "Mereworth" Campbell contrives a square house with a portico on each face and a central domed hall, which might be capable of charming treatment; unfortunately, his staircases are mere corkscrews in the piers of the dome. The plan of Kedleston (as shown on paper, but never finished), with its outlying pavilions connected by quadrants, is a kind of plan which looks more effective on paper than it ever can look in reality, as you can never see it all at once; moreover, the quadrants are badly managed. At Nostel (Paine) the same idea is better carried out, though the interior plan is very commonplace compared with Kedleston. At Holkham Hall (by Kent) the pavilions at the angles are rectangular and more closely connected with the house; but the main idea is the same as at Kedleston. A remarkable plan, standing quite alone in character, is that of Buckland, by Wood, of Bath. In this case the two end octagons are the chapel and the library; the basements under them are respectively wine and beer cellars. Stanlinch, also by Wood, shows somewhat the same general idea; but the arrangement of the doors in the central portion of the house is such as lose the vista from end to end. Moor Park (Thornhill) is a remarkable example of a stately approach, in which the quadrant colonnades are extended so as to form a mask to the wings, leaving the planning behind them rather inconvenient.

#### THERE ARE FEW THINGS MORE FASCINATING

than the study of this collection of plans, so full of fine suggestions of effect, so uniformly stately and dignified in their variety. One cannot help thinking what one could do with them in actual architectural treatment. It is true that our enthusiasm, in a sense, is damped on turning to the elevations. Now that we have shaken off the deadening influence of architectural scholasticism and red tape, what splendid things we could do if we could only get the chance of treating some such mansion plans as these with the freedom and the richness of detail which we could impart to their treatment in the present. Surely we could make something finer of this type of plan than of the irregular and so-called "picturesque" plan? But then there is the question of convenience—a question which will not be shirked. What does the inconvenience of these Renaissance plans really amount to? It lies mainly in one point—the position of the kitchen. You will find again and again in architectural books, the kitchen was 100ft., 150ft., 200ft., from the dining-room, &c. Even in the modern example, Mentmore, the distance from the kitchen door to the dining-room door, taking the line along the passages, is 147ft. That is a real inconvenience; but there is no occasion to revive that. In these days of lifts the kitchen might be in the basement, or it may even be in the attic—perhaps with greater advantage. Apart from that kitchen question, the wing system of plan may retain all its architectural attractions, not only without any sacrifice of convenience, but even a certain convenience and suitability.

#### LET US SUMMARISE THE PROBLEM.

from the present point of view. In a mansion of the largest class we have to provide for two distinct departments, very different in their architectural requirements, and yet which must be in tolerably close relation with each other. We have the owners and their family and visitors on the one hand, with the rooms in which their life is to be lived; and on the other hand the servants and the rooms in which the work and supply of the house have to be carried on. Granting the principle that the mansion should be treated architecturally in a symmetrical manner, how are we to treat these two departments? If you wish for one great block, it is possible to divide the two departments vertically, to have a lofty two-storied basement, with a very wide sunken area for the lower windows, and place the state-rooms and living-rooms on the first-floor, with a great staircase up to their level. That is the old system of the Italian Renaissance palaces; it has been little if at all tried in England, but it naturally suggests an architectural treatment

which would be very fine and effective indeed, and is worth thinking of. Another method is the favourite one of the Renaissance architects, of the wings connected to the house by corridor buildings. Then we may have, what is the more favourite scheme now, the servants' quarter and offices rather more closely attached to one angle of the main building, forming a second parallelogram placed *en echelon*, or a long wing stretching away to the rear. But in this case it is difficult to make it part of the main architectural design; it must be retired and planted off out of sight. In regard to the house itself, there are three main points to consider—the approach and entrance, the hall and staircase, and the entertaining rooms. A forecourt of some kind, if possible flanked by a colonnade or cloister on each side, always adds to the dignity of the house. And for the access to the house there is nothing so fine as a flight of steps—still more a double flight, in two curves, provided the basement is high enough to afford opportunity for it. Inside the house you must have a large central hall, lighted from above, unless it goes right through the house with a great window at each end; and you must have, above all things, a spacious and noble staircase, not hidden away out of sight. Where there is a very large hall, the stately staircase will probably be one which is in the hall, and forms part of it. The difficulty in such a case is to plan it so that it will not interfere, above, with the integrity of the gallery or loggia which you will certainly have round the hall on the upper level. The weak point in a staircase is the raking soffit, and it is well, where it can be designed so, that this is hidden, and only the steps themselves are visible. Where the general plan allows of it, a flight of stairs on a long curve is nearly always fine; not a circular stair, but an elliptical hall, with a stair following its curves up on each side. As for the entertaining rooms, the great desideratum for them is that which applies also to the whole ground-plan of the house—viz., that they should represent an architectonic conception in the configuration of each room, and in their relation to each other. The great thing is that there should be an idea, and not merely a space divided into rooms by walls. In conclusion, the author observed that he would encourage those who have the chance of building large houses to endeavour to revive in them some of the old stately character which has been sadly lost during the present century through a mistaken craving after the picturesque, and not to be afraid of trying new and original dispositions of plan merely because they were new and original.

Professor G. AITCHISON, R.A., P.R.I.B.A., in proposing a vote of thanks to the lecturer, echoed his plea for making the plan govern the arrangement of the house, and not allow the building to group itself in a rambling and haphazard fashion. The fault of Castle Howard was the absence of a grand staircase; but probably the fact that the two existing staircases were small, and indeed ridiculous in scale, was due to the fact that all the state rooms were on the ground floor. In most town houses the principal reception rooms were on the first floor, and thus an imposing staircase was one of the greatest desiderata. At Lord Leconfield's town house in Chesterfield-gardens a double staircase was arranged with very fine effect. A large circular staircase was imposing, provided the steps could be made continuous, and in the Later Italian Renaissance an elliptical stairway was used with beautiful results. At Blenheim the general effect of the building must be pronounced good, although the treatment was heavy, and the details were abominable. Sir Charles Barry was a great planner as well as designer: his houses were harmonious in proportion, but his staircases were too often inclosed between walls.

Mr. HALSEY RICCARDO agreed with the lecturer that an architectonic idea was what made a plan interesting to those who came afterwards. The English Renaissance plans were interesting historically, but they were not truly responsive to our national character. Blenheim was attractive from its historic associations, but it was rather depressing in effect, and it did not appeal to our sympathy and sentiment, whereas good architecture of any period should do so. Typical modern buildings were hospitals and board schools, and modern architecture should embody present humanitarian ideas. We should no more attempt to reproduce Renaissance mansions than Mediaeval castles. He seconded the vote of thanks.

NEW HOTEL, PEVENSEY BAY, SUSSEX.—FRANK J. BREWER, F.R.I.B.A., Architect.

Mr. BERESFORD PITE thought the author's survey was more restricted than usual; the lecturer had evidently been fascinated by Colin Campbell and his "Vitruvius Britannicus." They should not forget that Norman Shaw long ago delighted them with his charming and artistic Gothic plans quite as much as by his later and more methodical work. The interest of the subject was, after all, historical, and not practical, for in actual practice the architect must adopt, to a large extent, his clients' views. Economy guided his pencil, and the architect had to do his best to transmute the prosaic instructions into architecture.

Mr. FRANCIS HOOPER remarked that Ernest George had shown them, in his cottages for Lord Lonsdale at Guildford, that it was possible to give dignity and symmetry to small houses, and to avoid the usual barrack-like effect.

The PRESIDENT, in putting the vote of thanks, which was cordially agreed to, and was acknowledged by Mr. STATHAM, said they had been hearing that evening of large mansions, where regularity might be called for; but in their small houses picturesqueness was a desirable quality.

#### NEW HOTEL, PEVENSEY BAY.

THIS hotel is now being erected fronting the sea in Pevensey Bay, near Eastbourne, for Mr. C. R. Holmes. The exterior walls are to be faced up to the first floor with red bricks from Tunbridge Wells, and the upper portion is to be rough-cast. The dressings are to be in Portland stone and fine rubbed bricks. The roof is to be covered with sea-green slates. The internal walls and partitions are to be plastered with Serapite plastering, and all the woodwork in public rooms

is to be finished in green oil-stain, varnished. All external walls are to be built hollow. The billiard-room is to have an open-timbered roof. There are to be fifteen bedrooms, with bathrooms on the first and second floors, besides three public sitting-rooms, convertible, by the removal of sliding partitions, into a large ball- or concert-room on second floor. The accommodation on the ground floor comprises large dining-room, private sitting-room, private bars, saloon-bar, bar-parlour, billiard-room, kitchen, &c. The basement is devoted to rooms for servants, and for cellars, &c. The hotel will be fitted with all modern requirements, including lifts, electric bells, salt-water baths, &c. A large piece of ground between the hotel and the sea is to be laid out for tennis, &c. The hotel is being erected to supply a long-felt want in Pevensey Bay, which place is visited by increasing numbers of visitors during the summer months, and has been designed to harmonise with other houses now being erected in the bay by the architect, Mr. Frank J. Brewer, of Richmond, Surrey, and Buckingham-street, Adelphi. The contractor for the building is Mr. James Martin, of Eastbourne.

#### THE LONDON BUILDING ACT, 1894, AND THE OFFICIAL SUPERVISION OF BUILDINGS.

THE discussion on the paper read at the previous meeting of the Surveyors' Institution by Mr. W. Weaver was resumed at the meeting of Monday last by Mr. Douglass Mathews, who said that he took it that the author's object was to point out that under the present dual system of district and vestry surveyors, with areas and powers overlapping, anomalies and

inconveniences occurred which might possibly be avoided by some better arrangement. He did not agree that either the one or the other of these officers could alone fulfil all the duties required, as he thought that in most districts the time of each was already fully occupied, and he thought that before any alteration was made it was most desirable to consider carefully whether it was needful. He thought that if the word "engineer" instead of "surveyor" had been applied to the controlling local official, there would be less confusion as to his duties and qualifications. The position of district surveyor was rightly regarded as one of great responsibility, and was not, he thought, sought as a means of increasing private practice. Whether the new regulations prohibiting private practice were wise, he did not presume to say; but the candidates for district surveyorships were undoubtedly less numerous now than formerly. A borough surveyor, he thought, should have been trained as an engineer, while a district surveyor in London must have an architectural education, but not necessarily as an art architect. The examination for district surveyors, he thought, was a very thorough test of their suitability for the position.

Dr. Longstaff, L.C.C., seemed to think that the true path lay between the two extremes expressed in the views of the author and the criticisms of Mr. Blashill, both of whom were shortly to sever their connection with the active duties with which the paper dealt, and so spoke from an independent standpoint. It was, he thought, one matter to consider how building in London should be regulated, and another thing to determine how the regulations should be carried out. In most cities buildings were under the control of the municipal authority; but

London was an exception, and the Building Act, being law, must be carried out. He had had much to do with the framing of the Building Act, and should it ever be superseded, he could only pity the man who attempted to frame the next Act. The present Act was, he thought, in parts too weak and in parts too meddlesome. With regard to the prohibition of private practice by district surveyors, there was much to be said on both sides; but he was inclined to think that, on the whole, the rule had worked well. He thought that a great improvement might be effected if it were possible to make the jurisdiction of the district surveyor continuous as to area with that of the vestry surveyors, for it was undoubtedly a grievance that a builder should be erecting a building in one district, while the control of, say, the drains was in the hands of the surveyor of another and overlapping area.

Mr. H. Lovegrove said he hardly agreed with the author of the paper that district surveyors did their work of scavenging, paving, and such things less completely than parish surveyors. Anyone who would compare the road under the vestries with those in the City of London would agree with him. He also could not see that a mere acquaintance with the practical details of building construction was a better qualification than an experience gained in general practice, or that a surveyor who was merely a surveyor and engineer was competent to criticise the work of an architect. He thought that neither the general public, the County Council, nor Parliament itself would approve of relegating the duties now placed on the district surveyor to an officer under the immediate control of the vestry. As to delays, he had frequently heard expressions of surprise by country architects at the speed with which plans were passed and work commenced in London. He did not think the proposed change would in any way diminish the serious evil of wooden buildings in back yards, &c.; and he thought that the present treatment of dangerous structures was as nearly perfect as it could well be, while if the control of them was placed in the hands of the vestry, they would frequently have to be condemned or otherwise by men who, as owners or builders, had a direct interest in them. Mr. Weaver had said that a district surveyor often took the position for the sake of the practice to be gained; but he thought that extra practice might fairly be accounted for by the confidence of the public in a man whom they knew must be well qualified in order to attain to such a responsible position.

Mr. G. Livingstone said the subject was one which had been under the consideration of the vestries and their surveyors for some time past, and was one on which much might be said from both points of view. It had been argued that the system which prevails in most country towns might, with equal success, be adopted in London; and it seemed to him that the ordinary training and the necessary examination in building construction through which nearly every young man aspiring to become a borough engineer or vestry surveyor passed, attested his fitness to at least undertake the work of supervision of buildings without his necessarily being an architect in the full sense of the term. Many of the district surveyors were fully qualified architects, and as such in their practice gained experience which was invaluable in their duties as officials. If the assistant of a busy architect acting as surveyor was competent to attend to his official work, surely a well-trained municipal engineer could do the same.

Professor Roger Smith said he took the paper as an expression of opinion, and could not find that it was based on any cogent arguments; but even an opinion coming from a man of Mr. Weaver's experience was entitled to all deference. He did not agree that surveyorships were sought with a view to increasing private practice. The advantage of the present system was that the surveyors were under the County Council, and any indignation caused by their decisions went up to that body, and there probably evaporated, while a local surveyor must report to the committee of his board.

Mr. H. Gundry said that he had thought that, living in London, he was in the centre of the Empire; but he found that, from the remarks of the author and previous speakers, Kensington really seemed to be in itself the Metropolis. He took it that the question was not whether either the district or the local surveyors were competent

or otherwise, but rather between the district surveyors and the building committees of the vestries, to whom their surveyor must refer any case in dispute. The members of these committees were sometimes, as was well known, interested parties in the matters referred to them.

Mr. P. E. Pilditch said he agreed with the first proposition of the paper—that the present system was defective; but he was not so sure that the remedy was to be found in the absorption of the municipal surveyor by the district surveyor, or *vice versa*. The present system certainly led to a great deal of friction and loss of time and money to owners and builders, and, so far as the London County Council were concerned, he believed that much of the delay was due to the failure of the different committees to act together. Many points, such as the widening of streets, frontage-lines, sites of new or substituted buildings, &c., could, he thought, be best dealt with by a short amendment of the existing Act. It was, no doubt, possible in many smaller and suburban districts to find men capable of filling the two offices; but in large or densely populated districts the work would be too onerous to be left to one man, unless he were allowed to relegate it to assistants.

Mr. J. M. Knight agreed with Mr. Weaver that it would be desirable to enable men trained as architects and qualified as district surveyors to undertake the duties of local surveyors. He had himself practised as an architect while filling the position of local surveyor for the last thirty years, and he believed the arrangement had been to the advantage of his board. He did not think any argument as to London could be drawn from smaller committees.

Mr. R. A. Robinson, L.C.C., referring to the policy of the County Council in appointing surveyors on the condition of their not engaging in private practice, said the matter could be regarded from two points of view; but up to the present time the arrangement had worked most satisfactorily.

Mr. A. King thought the dual duties of surveyors could not be satisfactorily carried out under the suggested scheme, as each had already quite enough to do.

Mr. Wheeler, Q.C., did not agree that it was advisable that the present system of fees should be maintained. These fees came, in fact, on the building owner, and thus on the rent, and so on the ratepayer; and it would, he thought, be better to pay them direct in the shape of a salary chargeable on the rates.

On the motion of Mr. E. W. Hudson, the discussion was adjourned to the meeting of February 6.

#### RETAINING WALLS.\*

By A. T. WALMSLEY.

THE centre of pressure should in the case of all banks and retaining walls not be nearer the outside edge than one-third the width of the foundation, or, in other words, should fall within the middle third of the base. The mean thickness of brick, masonry, or concrete retaining walls in ground of an average character should be equal to one-third of the height from the top of the footings, and as experience shows that under no ordinary conditions of surcharge or heavy backing it is necessary to make such a retaining wall on a solid foundation more than half the height of the wall in thickness, we have a mean thickness of five-twelfths—i.e., the mean between one-half and one-third—to provide. A margin of one-twelfth usually is assigned to a batter of an inch to the foot. Too great a batter is not desirable, as the wet gets into the joints and tends to weaken them. Earth pressure is different for every varied kind of soil, and is also greatly influenced by the dry, wet, compressed, or loose condition in which the soil is found, absorption of water tending to increase such pressure, but it is found by experience that the average actual lateral thrust of good filling may be approximately taken as equivalent to a fluid weighing 10lb. per cubic foot, and if, as a factor of safety, we double this unit pressure so as to allow for contingency of vibration and variation of soil, it follows that a wall should be able to resist about 20lb. fluid pressure, for which it needs to have only a theoretical thickness of one-quarter of the height. There is, however, a line of fracture, along which the earth that is retained by a wall surcharged with earth has a tendency to slide, and

this line has been found by numerous trials to practically bisect the angle formed by the natural slope of the material of which the soil is composed, and the line of the back of the wall. This element forms an important consideration in the calculation of retaining walls, as it enables us to arrive at the weight of a mass acting vertically, which is prevented from sliding on this line of rupture by the wall. Though this gives the back pressure to be dealt with, accidents may occur from the want of due care in the back filling. As a rule, the earth backing should not be tipped in. If the backing be of clay, great care must be taken that it is not too dry, or it will swell on becoming moist, and produce pressure on the wall that may not have been foreseen. For this reason mixtures of sand and clay are bad, the sand admitting water and the clay retaining it. That the generally accepted natural slopes of material are more or less empirical is evident from an inspection of certain large clay-pits, where the clay is seen to stand more vertically than is usually estimated in the calculation of earthwork pressures. Weep holes for drainage should be provided in a retaining wall, and the weep holes should not be under 7sq. in. in section, or they will soon choke and become ineffective until cleared. They may be inserted at different levels, and in order to convey the surface water, which necessarily drains into the earthwork, to these points of escape, it is advisable to back up the wall with dry stone or rough angular material. The author was consulted in 1884 upon a concrete wall built in front of some meadow land at Fulham, where the wall was designed perfectly strong enough for the work it had to perform in protecting the meadow abutting on the River Thames, but where failure resulted by the concrete being improperly mixed, it being found that it could be as easily broken up as an ordinary macadamised road. Great care is needed in joining concrete to concrete. The surface needs to be well washed, scraped with a wire brush, and dusted with neat cement before another is built over it. It is not always by overturning that walls may fail. They may give way, as above described, from bad workmanship, or they may slide bodily forward on their base, or their foundation may subside. It is a common rule to allow from one to one and a half tons per square foot on a foundation of ordinary firm earth. Slipping may be obviated by benching out, so as to provide a base at right angles to the direction of the line upon which there is a tendency to slip. In this way dwarf-walls have been built with inclined tops and bases at the toe of the slope to a railway embankment. Such retaining-walls, though only about 3ft. or 4ft. in height, hold up the slope, and may be arranged so as to provide sufficient clearance for an additional line of rails to be laid. A form of retaining-wall frequently met with in practice, especially in brick structures, is that with a curved batter stepped in off-sets at the back. The curve usually adopted is the arc of a circle, the radius of which is from two and a half to three times the wall's height, and the centre of the curve is, as a rule, in the same horizontal plane as the top of the wall. In such structures the courses are built to radiate from the centre, and the result is that the joints of the brickwork at the back are thicker than is expedient. When the radius of curvature is large, the increase of thickness may be inconsiderable; but it becomes large when the radius of the curve is a short one, since the thickness of the wall cannot be reduced in the same ratio as the height or as the radius. Retaining-walls are frequently employed upon railways in which buttresses connected by horizontal arches are introduced. The chief advantage of a curved form of construction is that the curvature brings the centre of gravity further in towards the bank, and although it conveys the idea of greater strength than a straight batter, it is more expensive, and care must be taken that in the end bay the horizontal arch is not left with a single abutment. Curved batters cannot be universally recommended. Even when curved vertically, as in a sea-wall, the foundation is more difficult to get in, and the bed-joints have usually to be set out at right angles to the face of the wall. Counterforts constructed at the back of a retaining wall are usually preferred to buttresses, on account of the encroachment made by buttresses upon the roadway, whereas counterforts help to oppose more friction to the earth at the back of a wall. There are two main points of importance relative to counterforts always to be

\* Read before the Civil and Mechanical Engineers' Society, Jan. 5.

GROUND FLOOR PLAN

remembered. They should not only be built simultaneously with the wall, but the wall should be well bonded with each counterfort, otherwise they tend to detract from the wall's strength, and the material employed in their construction might be more profitably added as a uniform increase of thickness in the wall. A judicious increase in the theoretical thickness of a wall should always be provided. The pressure of water in front of a wharf will doubtless help to sustain it; but this pressure may be reduced or removed, or, upon the other hand, the internal pressure upon the opposite side of the wall may likewise be reduced or removed. All such contingencies should be provided for at the outset. The width at the top exercises a considerable effect on the transverse section. When the surface supported is level with the top of the wall, the thickness at the top may be one-tenth of the height, up to 30ft., the minimum thickness being 18in., and the maximum 3ft. The back of a retaining wall should be rough, in order to resist any tendency of the earth to slide upon it. This object is promoted by building the back in steps. A catch-water drain behind a retaining wall is frequently expedient. It may either discharge its waters through pipes into an outside drain in front of the base of the wall, or it can be provided with an independent outlet. In calculating the section of a wall, and providing for the distance of the centre of resistance from the compressed edge to be no nearer than at least one third of the thickness throughout which the pressure is distributed, it is, of course, assumed that the mortar exerts no appreciable tension, as such action would invite cracks. The coping of a retaining wall should consist of large flat stones, preferably laid as headers. In cases where it is necessary to anchor the face of a wall by introducing tie-rods, the level of tie-rods depends upon their object. If the retaining wall is to depend mainly upon the tie-rods for its security against sliding forward, the tie-rods should be fastened to plates upon the face of the wall in the line of the resultant pressure of the earth behind the wall—that is, at one-third of the height of the wall above its base; but if the resistance to sliding forward is to be distributed between the foundation and the tie-rods, they are to be placed at a higher level. Thus, supposing the tie-rods to be fixed to the face of a wall at two-thirds of its height above the footings, the horizontal thrust will become equally divided between the

tie-rods and the foundation. In the case of a continuous concrete wall with an exposed face, it is well to assume that cracks will appear, and to form a straight joint, say, every 30ft., whereby the tendency to crack is obviated, and there is no defacement. In the case of a concrete wall against which there is a shifting foreshore, it is well to face the concrete with masonry. Precaution should also be observed to extend the concrete base of the wall both forwards and backwards as to cause the line of resultant pressure to be central over the space of ground upon which the footing is laid, and the concrete toe must be made sufficiently thick to obviate risk of breaking across. About the year 1869-70 the last cliff reachment at Dover was built of American elm piles and planking backed with concrete. The term "reachment" is a military one, and is equivalent to "retaining-wall." In 1873-75, the planking was removed, and the concrete was cut away to receive a facing of Kentish rag stone.

## SAINT STEPHEN'S HALL, SHEPHERD'S BUSH, W.

THESE buildings now being erected, are situate in the Ellerslie-road, Shepherd's Bush, on land given by the Ecclesiastical Commissioners. The hall, intended to seat about 450 persons, is to be used for parish purposes, mission work, entertainments, &c., and the adjoining house for district visitors' rooms and parish work in connection with the church of St. Stephen, Uxbridge-road. The hall, about 60ft. by 30ft., has a height of 16ft. to the wall-plates, with a roof open to the collar level. The external walls are faced up to the string levels with Lawrence's orange-red bricks, and are rough-cast above. All the stone dressings are in Monk's Park stone. The roofs are covered with Westmoreland green slates. The internal woodwork in the hall is stained a grey green, with oil-stain, and varnished. Boyle's ventilators have been used for the ventilation of the hall. The contractors for the works are Messrs. S. N. Soole and Son, who are carrying out their contract in a very satisfactory manner under the superintendence of the architect, Mr. Frank J. Brewer, of Richmond, Surrey, and Buckingham-street, Adelphi.

The urban district council of Ashford, East Kent, have raised the salary of their surveyor to £250 a year.

## NOTES FROM EDINBURGH.

THE year just passed away has ended as it began, with a record of work accomplished and a prospect of unprecedented magnitude. It has seldom happened that so many enterprises of such great expenditure have been all in course of their progress simultaneously, and to this circumstance, no doubt, the good prospects for the coming year for all connected in any way with the building trades are due, and may safely be relied upon. For many years back there have always been at least one or two schemes for the improvement of the city as regards its streets or public buildings, and these tided over the depression in speculative work prevailing in other large centres. These comprise the improvements made in the Old Town under Act of Parliament, the rebuilding of the Royal Infirmary, the new University Buildings, and the numerous and costly buildings erected for the school board; and last, but not least, the reconstruction of the North Bridge. These are now all accomplished works, but will not stand comparison for their yearly volume with what will have to be in progress for the coming year. The reconstruction of the N.B.R. station is still far from its completion, although its arrangements for the convenient arrival and departure of the passengers are vastly better than they have been for so long a period. The removal of the railway offices to Waterloo-place will add to the work originally contemplated in the building, now altogether reserved for the hotel. The rebuilding of North Bridge-street is an undertaking of greater magnitude, if on a scale of less expensive character. The new hotel at the west end of Princes-street, to be erected at the Caledonian Railway Station, has been estimated, and will no doubt shortly be commenced. Two larger and one lesser insurance buildings are still far from completion. The new Infectious Diseases Hospital at Colinton has been making tardy progress for the year, and four out of five pavilions remain to be built, only one and the nurses' home having been roofed in. The cabling and extension of the tramways, and the increasing demand for the electric light, have made new stations necessary, and two new large schools have been reported as required for northern districts of the city.

The demand for small houses of from two to four rooms still continues to be unsupplied,

COURT THEATRE, VIENNA.

speculative building in this department continuing to have its plans before the Guild Court. The ground available for houses of the better class, to the east of Donaldson's Hospital, has for many years been taken up; but that set aside for similar buildings on the north side of the Water of Leith, and along the Queensferry-road, has of late years been neglected. Suburban villas appear to have the preference, for which there is ample scope in the southern and western and northern sides, and it is in this department only that much has been done in the way of better class of buildings.

In all the recent additions to the city architecture, nothing of much novelty has appeared, if exception be made of the Prudential Assurance building in St. Andrew-square. This building has recently been decorated with a statue of the cardinal virtue from which the association takes its name. It is placed in a niche in the projecting corner turret of the first floor, and looks more in proper place than the panels of carving on the north side, above circular windows on the ground floor.

The Standard Insurance will have the most extensive frontage of the four insurance buildings now in course of erection, and is nearly completed in its cornice, and will be an imposing edifice in the old Classic style (now a novelty), depending more for its effect on the magnitude and elegance of its proportions, than on any picturesque variety of decorative detail. Preparation, however, is being made for a decorative frieze. The Usher Hall, having got a site at last, has not been heard of for some time, and probably this work will not be started during the present year.

The sudden death of Mr. W. Hamilton Beattie has removed an architect who has left more numerous memorials of his energy and skill in the civic architecture than any other. He was architect, engineer, and surveyor, and must have had extraordinary aptitude for all departments of work. It is thought that he had overtasked his strength. He seems to have made the French Renaissance his model as to style in his larger edifices, such as Jenner's Buildings and the new N.B.R. Hotel.

The late Dean of Guild, Mr. Miller, C.E., has resigned, having held the office for the long term of seven years. His successor, Mr. Ormiston, is a surveyor of large practice, and has long been conversant with all details having reference to the construction or valuation of property, and enters on the duties at a time when there will be plenty of work cut out for him to dispose of. The sanitary requirements, as well as the legal questions often involved in the decisions of this court, require knowledge which can be acquired only by some experience.

Not much in the way of church architecture has been in hand in Edinburgh for some years. This year a new church for the Free Tron is nearing its completion. This, however,

is not one added to the city churches; but only a city church migrating to the Mayfield suburb, the old church being now a warehouse. It is constructed with a deep west gallery, and spacious vestibule below. The entrance is by a doorway in the tower built on to the North side up to wall-head level, to be finished with a spire. It has a short and narrow passage aisle and arcade of three arches, with clerestory and two narrow transepts, and apsidal east end to the nave. This appears to be the popular style with parties who affect the Anglo-Catholic arrangements of a church interior. The nave arcade, in nine cases out of ten, is far too short for the width, where transepts are required, and the interior in this case would have been much better without them. The arcade is very nicely moulded, with pillars, capitals, and bases of good proportion and details. The roof and ceiling are designed apparently in imitation of old carpentry—i.e., a massive beam with decorative cornice stretches from wall to wall, carrying a pillar in the centre, which is connected with the collar-tie. The effect of this, with the boarding on and under the constructive timbers, is still concealed by scaffolding. Externally, the decorative detail is confined to the west front and the tower. The design is interesting in its attempt (not very successful) to combine Flamboyant and Perpendicular details. The large west window is subdivided by two larger mullions, but running straight into the arch without any member corresponding to the arch. The mullions in place of the tracery have only the flat arch cussing on the arching, and the upper part of the window looks naked without the tracery usually put into the arched head of such windows. The transom bar, with its soffit cussing, does not follow the line of structural stability as usual, but is stepped from the centre down to the sides. There is a fair amount of merely surface decoration in the way of Flamboyant tracery with, what will be when finished, crocketed moulding. This, however, requires for itself large masses of the red stone used only for the dressed work, and gives to the front a rather patchwork look. The tower has a good band of narrow pointed arcading of simple character; but the quatrefoil decoration of the base is somewhat out of place, though it might adorn a parapet.

A new church for the U.P. congregation has been begun at the junction of the London and Easter roads, and some others are being talked of.

There is no symptom anywhere of the New style even beginning to be, and a recent contributor on the subject in the *Building News* has completely and satisfactorily settled the matter when he postpones the advent of the New style to the days when iron shall supersede the use of stone or bricks.

The police commissioners of Stirling have accepted tenders exceeding £3,000 for the erection of a corporation electric-lighting station.

#### MODERN OPERA-HOUSES AND THEATRES.\*

[WITH ILLUSTRATIONS.]

MR. EDWIN O. SACHS has completed his veritably monumental work on this subject in three folio volumes, and undoubtedly must be congratulated on the cosmographic character of his useful and successful undertaking. It is illustrated by 220 plates and over 1,000 diagrams. Never before has there been such a development of playhouses as that which the past three or four years have recorded, and, till Mr. Sachs embarked upon his big book now finished, the planning and construction of theatres had never been adequately described and illustrated. Theatre architects were few in number, at any rate in England, and somewhat naturally they endeavoured to keep their knowledge to themselves as a speciality. Mr. Sachs has gathered an immense amount of information from all kinds of sources together, and has told us more than we ever knew before about the contrivances of stage construction and the technicalities of theatre design. The preparation of the work has occupied the author more or less over a period of eight years, affording him congenial relaxation, as he informs us, during the hours spared from professional practice. We have noticed the previous volumes as they were issued to subscribers, and to-day we can unhesitatingly commend the concluding folio as heartily as its predecessors, while the completed work is of unquestioned value to all who are in any way associated with the building or conduct of theatres or playhouses. Theatre fires and legislation concern the community at large, and, in the sections devoted to these subjects, Mr. Sachs has done his best to record stern, and even sometimes, unpalatable facts, which are of the utmost importance to all public councils and municipal bodies having authority over the erection of public places of entertainment, and who, therefore, are largely responsible for the safety of the playgoing and sight-seeing portion of the population. Among the new theatres illustrated in the last volume now before us, may be mentioned that at Norwich, the Crown Theatre, Peckham, the Variety Theatre, Middlesbrough, and another at Hastings. The skeleton plans of a great many auditoriums are very useful, and it must have occasioned an almost endless labour to obtain particulars of so comprehensive a series of examples. The same remark applies to the skeleton sections, drawn presumably to uniform scale. Treatments of prosceniums, too, are copiously illustrated, both from at home and abroad. Among the leading foreign houses of course comes the Court Theatre at Vienna, of which Gottfried Semper and Baron Hasenauer were

\* Modern Opera Houses and Theatres. Examples selected from Playhouses recently erected in Europe. By EDWIN O. SACHS, Architect. Vol. III. London: B. T. Batsford, 94, High Holborn. (The work, complete, £15 15s. 0d. net.)

the architects. The frontispiece of Mr. Sachs's book is devoted to a general view of its exterior, and this drawing, by Mr. A. N. Prentice, we have reproduced to-day. The "Hofburg" Theatre, as this edifice is called, is the property of the Emperor, and is managed by his Lord Chamberlain; the auditorium with its grand suite of reception rooms being frequently used for Court ceremonies and the entertainment of the royal guests. The Viennese esteem this building with the greatest pride. So elaborate and costly a monument has never, perhaps, in any country been devoted to drama as distinct from the opera, and in Austria only important national buildings can compare with it for magnificence and display. Its size and proportions are, however, out of scale with requirements of chamber and classical plays. The stage, auditorium, foyers and offices are too large, and its technical appliances are elaborated out of all proportion to the requirements, and, above all, as Mr. Sachs remarks, the architectural treatment, both of exterior and interior, is far too showy and pretentious. For a national opera house such a design might have been admirable; but for the drama, in so vast a place, acting falls into exaggeration, and loses all subtlety and refinement, while the voice, perpetually strained to reach the furthest point of the auditorium, lacks its usual tone, and becomes harsh and unresonant. The building was commenced in 1874, and the opening performance took place on October 14th, 1888. The chief feature of the design is the architect's attempt to give full expression on the exterior to a scheme which is entirely governed by the lines of the auditorium and stage. The cost was nearly £550,000, and the theatre was planned to seat 1,475 persons.

Of the printing, type, paper, and binding of this standard work on theatres we can only speak approvingly, and accord the warmest praise to the whole undertaking. The considerable scale of the plans and diagrams adds very much to their value. Nothing seems to have been spared to render the volumes complete. Mr. B. T. Batsford, the publisher, co-operating with Mr. Edwin O. Sachs, the author, by uniting forces, experience, and infinite care, have produced a record worthy of their reputation, and commensurate with the importance of the subject with which these portly tomes are so usefully occupied.

#### CHIPS.

A stained-glass window has been placed on the north side of All Saints' Church, Bromsgrove. The work was executed by Messrs. Hardman and Co., Birmingham, and represents the Good Shepherd carrying a lamb. The carvings of the corbels and tops and spurs of the pillars at All Saints have been completed by Messrs. Martyn and Co., Cheltenham.

Sir F. S. Powell, M.P., has presented a site for a new church, which it is proposed to build in the Chapel Green district of West Bowling, Bradford. The church will be a memorial to the late E. B. Wheatley Balme, and will replace a mission church. It will provide accommodation for 500 persons, and the estimated cost is £8,000.

The Florid Gothic Cathedral at Cork is being redecorated by Mr. John O'Connell. A mortuary chapel is being added, Messrs. E. and P. Flynn, of Cork, being the builders, and the lighting arrangements are being rearranged and improved by Messrs. Porte, Sykes, and Co.

With reference to the alleged destruction of river scenery on the Thames at West Molesey, caused by the Lambeth Water Company erecting a high brick wall at the side of the Thames in extension of their reservoirs, a letter was read from the company at the last meeting of the Molesey Urban District Council. The company stated that the wall, which was of an ornamental appearance, designed with piers and panels, would be scarcely, if at all, visible from the river. A sloping bank would be erected above it, and when finished the river view would be as pleasing as before.

Abdication House, High-street, Rochester, formerly the residence of Sir Richard Head, Bart., M.P. for the city some 220 years ago, who received James II. there previous to that King's flight to the Continent, has just been brought under the auctioneer's hammer. It was sold for £2,200. The garden at the rear of this house, from which James escaped to the river Medway, still exists.

Mr. and Mrs. Fox, of Staincliffe, have decided to fill with stained glass the east window and the side chancel window of Holy Trinity Church, Batley Carr. The work is to be executed by Messrs. Powell Bros., of Park-square, Leeds, whose designs have been selected in competition with those of several other firms.

#### OBITUARY.

THE death occurred on Sunday of Mr. F. BELL, senior partner in the firm of Joseph Bell and Son, artists in stained glass, of College Green, Bristol. It was some nine months since that the illness which terminated fatally assumed a serious form. Of the many philanthropic and religious works in which Mr. Bell, who was 51 years of age, was engaged may be mentioned Sunday-schools, Sunday morning services for children, temperance work, night schools, and the Boys' Brigade.

Mr. H. Hicks, contractor and brickmaker, of Peterborough, died on Saturday at his residence in Park-road, in that city, at the comparatively early age of 51. For a long time deceased had been confined to his residence by serious illness. He was well known in the city and Eastern Midland Counties by reason of the important contracts he had fulfilled, and the energy and tact displayed in carving out for himself a successful financial career in life from an extremely humble position. A correspondent states that deceased had but a slight knowledge of the alphabet, and was unable to write, and was reputedly worth about £100,000. He had built the railway subway at Peterborough, engine sheds at Bedford for the Midland Railway Company, and many houses and business premises in Peterborough and neighbouring towns. Deceased was the founder and subsequently a partner in the brickmaking firm of Hicks, Gardener, and Co., from which he retired but a short time ago on terms involving a very substantial cheque. Deceased also owned sand and gravel pits at Woodstone, besides considerable landed and house property. He leaves a widow. Of late years the extensive contracting business has been carried on under the style of Hicks Bros., in which his brothers, James and William, were and are interested.

The tombstone to be erected over the grave at Bristol of the late Mr. George Müller by the orphans for whom he did so much, will be placed in position before the end of the month. It will stand at the head of the horizontal stone that now rests upon the grave, and bears the names of Mr. Müller's two wives. The stone, which is being prepared by Mr. H. Craik Smith, of the Old Turnpike Works, Totterdown, is of grey granite, and is massive in character.

The unveiling of a new altar, dedicated to the Sacred Heart, has recently taken place at St. Joseph's, Leigh, Lancs. The altar was sculptured and erected by Mr. Martyn, sculptor, Cheltenham, from the designs of Mr. Edmund Kirby, Liverpool. The design is, in general outline, a pendant to one dedicated to Our Lady, recently erected on the opposite side of the chancel. A tabernacle to harmonise with the rest of the design has been furnished by Messrs. Hardman, of Birmingham.

The heirs of the late M. Puvion de Chavannes have offered to the city of Paris 163 of his drawings on condition that they are permanently exhibited on the line in the new art gallery, which the municipality is about to instal in the Champs Elysées. They will be temporarily placed in the Musée Galliera.

At Raveningham, near Beccles, a new voluntary school and teacher's house, built at the expense of Mr. N. H. Bacon, was opened last week. The new school is of red brick, with Broseley red-tiled roof. A classroom is divided from the schoolroom by a collapsible screen; the teacher's house stands separately. Mr. A. Pells, of Beccles, was the architect, the builders being Mr. T. Hipperson and Sons, Barford.

A Local Government Board inquiry has been held at Chartham, Kent, respecting an application from the parish council for sanction to borrow £2,000 for providing a cemetery. Mr. Bromley, the architect, explained the proposals and exhibited the plans.

The markets and baths committee of the Birkenhead Town Council have recommended amended tenders for the construction of the north end baths on a less expensive basis than the former plans, and the tender of Mr. James Merritt, Birkenhead, for the sum of £11,000, has been accepted, leaving £2,000 for the salt water and filter installations.

An order has been made by the Light Railway Commissioners, and modified and confirmed by the Board of Trade, authorising the construction of a light railway in the counties of Dumbarton and Argyll between Arrochar and Loch Fyne. The railway will be 18 miles 6 furlongs in length, commencing at Arrochar, in the county of Dumbarton, by a junction with the West Highland Railway, and terminating on the shore of Loch Fyne, in the parish of Strachur, in the county of Argyll, in connection with a new pier to be constructed in that loch.

#### PROFESSIONAL AND TRADE SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—A meeting of this society was held on Monday evening, Councillor Willink presiding. A discussion took place in regard to the Architects' Registration Bill, the chairman remarking that its principal object was not to better the standing of architects, but to prevent incompetent men entering their ranks. A resolution was then passed approving the principle of the registration of architects, and suggesting that the Royal Institute of British Architects should take steps to bring the matter before Parliament. The chairman, in introducing the subject of the Liverpool electric tramway system, said that the line from Dingle had been erected in order to give the public an opportunity of seeing how it worked, and everybody seemed to conclude that it was satisfactory. For his part he had at first formed the opinion that the streets were becoming absolutely spoiled, but now that he had got accustomed to things he had modified his views. He still felt that the overhead erection was not a thing of beauty. The wires were too thick, but those to be put up in future would be much thinner, and consequently less objectionable. As for adopting the conduit plan, he was afraid the expense would endanger cheap fares. After some discussion the subject was adjourned until the next meeting.

The improvement committee of the Manchester corporation were informed at their last meeting that 60 cottages built by the corporation at Miles Platting are now almost ready for occupation, and that the rents have been fixed at 5s. 6d. per week. The cottages will replace dwellings which have been pulled down to make room for public improvements. It is intended to give the tenants an opportunity of purchase. Forty more cottages will be built so soon as a suitable site can be obtained.

The contract for the construction of the first portion of the Gifford and Garvald Railway has been placed in the hands of Mr. Joseph Phillips, contractor, of 11, Victoria-street, London, and the whole of the capital of the company has been subscribed. Mr. Phillips was one of the partners of the firm of Tancred, Arrol, and Co., who built the Forth Bridge. The railway, as now to be constructed, extends to about ten miles. It will be a light railway, and the principal stations will be Pencaitland, West Salton, Gilchriston, and Gifford. Parliamentary powers have been obtained for continuing the line hereafter to Garvald. The line will be opened for traffic within eighteen months or two years.

The corporation of Harrogate decided, on Monday, that the borough surveyor be instructed to prepare draft instructions to architects for competitive designs for the enlargement of the Spa, and submit same to an early meeting.

The amount subscribed for the testimonial to Mr. G. H. Small, the late borough surveyor of Penzance, was £171 16s., for which sum a cheque, accompanied by a letter from the mayor, on behalf of the town council and subscribers, was handed him. This method of presentation was in accordance with Mr. Small's own wishes. Mr. Small will send his acknowledgment from Madeira.

The memorial deposited against the London County Council Bill for the construction of reservoirs and works in Wales bears the signatures of over 100 persons who are interested in the property which it is proposed to take for the Yrfon and Wye Valley Reservoirs.

A meeting of the Leeds and Yorkshire Architectural Society was held in the society's rooms, Park-street, on Monday evening, when a paper was read by Mr. A. E. Henderson, A.R.I.B.A., entitled "Byzantine Architecture in Constantinople." The lecture was illustrated by drawings, some of which were reproduced in our lithographic pages last autumn. Mr. George Corson, president, occupied the chair.

The alterations to Willington Dane Railway viaduct, which have been going on for three months, are progressing. One-half of the work has been completed, and since Tuesday all trains have passed over the new portion, while the other half of the bridge is being renewed. The whole work will be completed by the end of March.

Mr. J. Stafford Ransome, M.I.C.E., the foreign representative of Messrs. A. Ransome and Co., Limited, of Stanley Works, Chelsea and Battersea, is severing his connection with that firm on Jan. 19, and starting as a consulting engineer on forestry exploitation and timber conversion at Albion Chambers, Adam-street, Strand, W.C. He has been connected with Messrs. A. Ransome and Co., Limited, for 18 years, and has visited between thirty and forty foreign countries and colonies.

THE PASSMORE EDWARDS PUBLIC LIBRARY, SHOREDITCH.—  
THE COURT THEATRE, VIENNA.—LIBERAL CLUB, HEBDEN  
BRIDGE.—HOUSE AT FALINGE, ROCHDALE.—HOUSE AT  
CROMER.—A GROUP OF SEVEN COTTAGES AT PORT SUN-  
LIGHT.

## Our Illustrations.

PASSMORE EDWARDS LIBRARY, SHOREDITCH.

THIS building was opened last year. The group includes the Shoreditch Public Baths. Mr. H. T. Hare, F.R.I.B.A., was the architect chosen in competition, and Messrs. Spalding and Cross were subsequently associated with him in the carrying out of that part of the undertaking. The main portion of the façade is occupied by the library, which is inscribed with the name of Mr. Passmore Edwards, who gave largely towards its cost, besides bearing the expense of the branch library at Kingsland-road for the same commissioners. The building now illustrated is in Pitfield-street, and the drawing which we have reproduced was shown at the Royal Academy last summer.

MODERN OPERA HOUSES AND THEATRES.

(For review and sketch-plan see page 58.)

LIBERAL CLUB AT HEBDEN BRIDGE.

THESE premises are approaching completion. The first floor provides a public or concert room. The walls are faced with Yorkshire straight-cut parpoints with local grit-stone dressings, and the roofs tiled with Staffordshire tiles. The works are being carried out by local contractors. Mr. Jesse Horsfall, F.R.I.B.A., Todmorden, is the architect.

HOUSE AT FALINGE, ROCHDALE.

THIS house has recently been built for Mr. F. G. Padwick. The walls are of Halifax straight-cut parpoints and local grit-stone dressings. The roofs are covered with grey slates. The work was satisfactorily carried out by Mr. Samuel Nicoll, general contractor, and Mr. T. Wilkinson, carpenter and joiner, from the designs and under the supervision of the architect, Mr. Jesse Horsfall, F.R.I.B.A., Todmorden.

HOUSE AT CROMER.

THIS house was built about three years ago, and the peculiarity of plan is due to its having no view at the back. The ground floor is raised above the general ground-level, and a simple gravel path inclined all ways leads up to the front entrance. The materials are split flint facings with red brick dressings for walls, brindled Broseley tiles for roofs, and lead glazing in many windows. The panels over ground floor windows are filled with a series of carvings in brickwork of birds, beasts, and fishes (not clearly shown in drawing). The architects are Messrs. George J. and F. W. Skipper, of Norwich and Cromer.

COTTAGES AT PORT SUNLIGHT.

THIS is a group of seven cottages, inclosing three sides of a quadrangle. The treatment is exceedingly simple, with rows of wooden casement windows, and with rough-cast walls above a plinth of red brick. The rooms are more ample in their accommodation than in the majority of cottages, and each house has the exceptional

luxury of a bathroom, which Messrs. Lever Bros. wish provided for all their tenants. Messrs. Ernest George and Yeates are the architects of this block.

## COMPETITIONS.

**BELPER.**—The competitive schemes for concentrating and disposing of the sewage from Belper have been submitted to Major Tulloch, C.B., R.E. In his report to the council he dealt with the question of the Derby water supply and the proposal to erect sewage works on any part of the river above the water intake. He has awarded the first premium to Messrs. Lomax and Lomax, 37, Cross-street, Manchester, who submitted a scheme under the *nom de plume* of "Valves."

**PLYMOUTH.**—At the meeting, on Monday, of the town council, Alderman W. Law presented the minutes of the Special Works Committee, and stated that the award of Mr. Sidney R. J. Smith, F.R.I.B.A., F.S.I., of London, upon the competitive plans in relation to the improvement of Tavistock-road, had been received, but not in time to present to that meeting. It would appear in the next agenda that was issued.

## CHIPS.

Mr. N. Staniland has been appointed electrical engineer to the city council of Canterbury, at a salary of £200 a year.

A new Wesleyan Sunday-school at Greenside, Wortley, near Leeds, was opened on Saturday. The old building, erected 40 years ago, had to be demolished owing to one of the walls having been condemned as unsafe by the corporation. The designs for the new and larger school were prepared by Mr. Wilkinson, of Park-square, Leeds, and the contracts were let for about £900.

A company, with a share capital of £20,000, has been formed in Dublin under the title of the Association for the Housing of the Very Poor (Limited). The undertaking is described as an earnest endeavour to benefit the very poor of Dublin by improving their buildings; inculcating sanitary habits, stamping out infectious diseases, and encouraging thrift and industry. The directors expect a return of 4 per cent. on the capital.

At the Guildhall, Gloucester, last week, Mr. W. W. E. Fletcher, Local Government Board Inspector, held an inquiry into the Corporation's proposal to borrow £15,000 for the purposes of a new infectious diseases hospital. The plans and the site, at Vineyard Hill, on the western confines of the city, have already been approved by the Board. Provision is made at present for 32 beds, and small-pox is not to be treated on the site.

On Wednesday week, the Mayor of Cardiff formally opened a new chapel for the Bible Christian Connexion, near Victoria Park, Cowbridge-road. The building is 60ft. by 38ft., and gives accommodation on the ground floor for 356, and in the galleries for 238 worshippers, exclusive of the choir. There are a vestry and small library attached to the chapel, and behind is a schoolroom about 46ft. by 25ft. on the ground floor, with a second schoolroom of equal dimensions on the first floor. The contractors were Messrs. Knox and Wells, of Cardiff, and the architects Messrs. Veall and Sant. The buildings are Early English in style. The contract price was £4,100.

The Leeds Board of Guardians adopted, on Monday, the plans of Mr. J. H. Morton, F.R.I.B.A., of South Shields, for a new workhouse at Hunslet, Leeds. The building is to be similar in design to the workhouses at present in course of erection at Doncaster and at Stamford, Lincolnshire, from plans by the same architect.

An Accrington correspondent of the *Yorkshire Post* states that negotiations are proceeding for a great brick and tile and terracotta combination. The initiatory steps are being taken among the Accrington brick and tile and terracotta companies.

Mr. H. P. Boulnois, C.E., an inspector for the Local Government Board, held an inquiry at Crewe on Wednesday week into an application made by the town council for sanction to borrow a sum of £25,000 for the purpose of electric lighting, and £980 for works of private street improvement. Mr. G. Eaton-Shore, borough surveyor, and Mr. B. Hopkinson, of Manchester, electrical engineer, explained the proposals.

In the case of the application of Thomas Axtell, jun., Oxford, builder, an order of discharge has been suspended until a dividend of not less than 10s. in the pound has been paid to the creditors, with liberty to the bankrupt at any time after the expiration of two years to apply for a modification pursuant to section 8 of the Bankruptcy Act, 1890.

## LEGAL INTELLIGENCE.

**A QUESTION AS TO ARCHITECTS' CERTIFICATES.**—Sheriff Gillespie has issued an interlocutor in an action recently raised in the Kirkcaldy Sheriff Court affecting the question of architects and their granting of certificates. Mr. Waddell, joiner, Burntisland, sued Rev. Mr. Dobie, Kinghorn, for £73 8s. 9d., as the value of joiner work he had done under a contract. Mr. Little, Kirkcaldy, was the architect under the contract, and the work had to be completed to his satisfaction. Mr. Little refused to grant a certificate for the work done, and insisted on certain conditions being complied with. The pursuer alleged that throughout the whole course of the work he had been needlessly and vexatiously interfered with by Mr. Little, and his demands were fanciful and faddy. Defender intimated that he was prepared to pay for the work whenever the architect granted his certificate. His lordship finds that pursuer has stated no relevant ground which would warrant the court in dispensing with the certificate of Mr. Little as a condition of payment. He therefore dismisses the action, and finds the defender entitled to expenses. His lordship, in a note, adds that the gist of the pursuer's complaint was that Mr. Little had insisted on exact compliance with the terms of the contract—in other words, that Mr. Little had done his duty as an architect; then pursuer went on to say that Mr. Little had been fanciful, but that was a matter of opinion. He was not prepared to say that a contractor would have no remedy if the architect persistently refused to grant a certificate, without stating what was wrong in the contractor's work, and what he required to be done; but it was tolerably plain from the condescendence as a whole, and still more plain from the correspondence, that he knew what Mr. Little wanted, and, after having once stated his requirements, the architect was not bound to repeat them.

**CONTRACTOR V. CEMENT MERCHANTS.**—WELDON V. THE RUGBY PORTLAND CEMENT COMPANY.—In the Crown Court, before Mr. Justice Mathew, at Birmingham Autumn Assizes, last week, a case was tried, in which the plaintiff was Herbert Weldon, contractor, Chamberlain-square, Birmingham, who sued the defendant company for damages for breach of contract. The plaintiff was the contractor for the Coventry main sewage scheme, and he entered into a contract with the Rugby Newbold Cement Company, the predecessors of the present defendant company, for the supply of 900 tons of cement at 35s. 6d. a ton. During the currency of the contract that company transferred their business to the Portland Cement Company. But the cement supplied by the Portland Cement Company was rejected by the engineer of the works, on the ground that it was not in accordance with the specification, and on this being brought to the defendants' notice, they said they could not turn out cement of the fineness stipulated for in the specification, and they could not go on with the contract. The question his lordship had to consider was whether there had been substitution of persons for the performance of this contract. Plaintiff was examined as to the contract and the correspondence which ensued. Mr. Jelf cross-examined to show that the Newbold Company accepted a contract under conditions which their machinery was not capable of complying with. Mr. J. E. Swindlehurst, engineer to the Coventry Corporation, stated that the first delivery of cement passed the tests except that as to fineness, but even on that point it was practically right. The subsequent deliveries were very far from passing the test. For the defendants, Mr. Jelf called Isaac Brooks, their manager, who was present at an interview between Mr. Alfred Walker, one of the members of the firm, and Mr. Wenham, who was liquidator of the Newbold Company, at the time the transfer took place. Mr. Wenham then said that so far as he knew the Newbold Company had no running contracts, and Mr. Hurst, who was the manager of the vendor company, confirmed that statement. Witness did not at the time know of any specification such as the plaintiff relied upon; and, further, neither their machinery nor that which they took over was capable of producing such fine cement. In every other respect the cement was good. It was admitted that the plaintiff had incurred an expense of £387 in carrying out his contract with the corporation, and judgment was given by his Lordship for this amount. Mr. Jelf was given leave to contest defendants' obligations under the contract in a higher Court.

One of the windows in St. Saviour's Collegiate Church, Southwark, is to be fitted with stained glass, representing scenes from "The Pilgrim's Progress," as a memorial of John Bunyan.

The guardians of the East Ashford Union have just completed a long-needed improvement at the workhouse at Willesborough by erecting new buildings, the approximate cost of which, together with alterations and improvements in the administrative block, is put at £6,000.

## Building Intelligence.

**ADDINGTON, CROYDON.**—The chancel at the parish church, which has been restored and decorated as a memorial of the late Archbishop Benson, will be reopened and dedicated on Friday evening in next week, January 20. The work of restoration, which was planned during Archbishop Benson's lifetime, consists of the reopening of a Saxon window which had been blocked, probably, for six centuries, and the construction of an hexagonal oak ceiling on the under side of 13th-Century roof timbers, in place of the lath-and-plaster ceiling which, at some period, had been substituted for the original boarding. A low reredos, of perforated white alabaster scroll-work, with statuettes of four archbishops, under canopies, has been placed below the eastern window. The walls of the church are adorned with varied diaper work, figures, and escutcheons. On the north side are the armorial bearings of Trinity College, Cambridge, Wellington College, Lincoln, and Truro—all closely associated with the late Primate's lifework. On the opposite wall are those of the five predecessors of Archbishop Benson, all of whom resided at Addington Park. Below the shields are figures of Cosmas on the south wall and Damian on the north wall, dedicated in Addington Church; and on the east wall, the Virgin Mary and St. Catherine are represented, and at the apex of the roof, the Christ in Glory, with adoring angels on either side. The architect is Mr. Arthur J. Reeve.

**AYR.**—A meeting of the town council was held on Monday, to receive a supplementary report from Mr. H. J. Blanc, architect, Edinburgh, relative to the rebuilding of the town hall, dealing with three further proposals in addition to two previously submitted, for the utilisation of the present site in High-street. After referring to the various schemes, Mr. Blanc stated that he was of opinion that a satisfactory and safe hall to accommodate about 1,500 people could not be constructed upon the site, and would not justify the necessary expenditure. The site might, however, be utilised for other buildings. A hall to meet all requirements on an independent site could be erected for about £15,000 or £16,000, exclusive of the site. The report was adopted, and it was remitted to a committee to proceed with the reconstruction of the police-court, and to consider how the rest of the site could be best utilised. The old site has therefore been virtually abandoned.

**BOUNDARY STREET.**—The London County Council has taken over from the contractor another block of dwelling-houses on the Boundary-street Estate, Shoreditch. The Council acquired the estate, of over 17 acres, in 1890, and the first blocks were opened three years ago. The scheme contemplates the erection of 23 blocks, of which 17 have been completed and 15 occupied. Two are nearly finished, and four will be completed during the year. The new dwellings are Domestic and Tudor in character, with tiers of bays and balconies running round. The tenements are in suites of two or three rooms, the rent for the latter, which will accommodate husband, wife, and four children, being 8s. 6d. per week; and for the former, which will accommodate husband, wife, and two children, 6s. 6d. The drainage is carried outside the tenements by iron pipes to the sewers, and the tenants are provided with galvanised iron dust-bins in the yard, and galvanised iron pails. The County Council are supplying their own gas to the dwellings. All the rooms are provided with picture-rails, and trees and shrubs are planted in ground round the building. Shops are provided on the estate for the convenience of the tenants of all the blocks, but only one of a kind, and workshops are let to various tradesmen at rentals varying from 3s. 6d. to 10s. per week. There is also a central laundry, and hot and cold baths are provided at a nominal charge. The estate has a terraced, circular garden, ascended by flights of steps, and in the centre there is a stand for the County Council band.

**CALLANDER, N.B.**—The Callander and Trossachs Hydropathic, which was destroyed by fire about five years ago, and has just been reconstructed, was opened the other day by the Lord Provost Richmond, of Glasgow. The original building was built in 1882 at a cost of £45,000. Two years later it passed into the hands of a limited liability company, by whom it

was conducted until it was burned. The new building, designed by Mr. James M. Munro, architect, Glasgow, is a four-story structure of white sandstone in a domestic type of English architecture. The overhanging oriel windows are finished with half-timbered gables, while the angles of the building are carried up to form towers, and balconies are provided from which the scenery of the Vale of Teith, the Pass of Leny, Ben Ledi, and the mountain range surrounding the Trossachs can be seen. At the main entrance, which, owing to the levels of the site, is on a level with the first floor, is a portico, through which access is gained to the panelled entrance hall and thence to the main corridor, which runs along the entire building, and measures 156ft. in length by 12ft. in breadth. Along the entire front of the first floor is a projecting balcony. The public rooms are spacious apartments, with panelled ceilings, and there are many suites of private sitting and bedrooms. Messrs. Wylie and Lochhead, Ltd., have been responsible for the furnishings. The baths include Turkish, Russian, and other types.

**CARDIFF.**—A new Bible Christian church and schools was opened last week in Cowbridge-road. The buildings comprise a chapel, to accommodate about 625 worshippers, with vestry and small library attached, also two schoolrooms, each 46ft. by 25ft., with kitchen and lavatory accommodation, and a caretaker's cottage. The buildings are carried out in local stone shoddies, with Corsham Down stone dressings, in the Early English style of Gothic architecture. The contractors were Messrs. Knox and Wells, of Cardiff. Messrs. Veall and Sant were the architects.

**HARROGATE.**—The Crown Hotel is undergoing extensive alterations and additions, under the direction of Mr. W. J. Morley, F.R.I.B.A., Swan Arcade, in Harrogate. The exterior of the new block, which will face the Royal Baths in Montpellier-road, will be of stone, having a lofty tower at the angle joining up to the present building and a gable. An entrance hall and lounge is to be made, 42ft. by 32ft., with mahogany wainscoting, round marble columns, and panelled and enriched ceiling. From the hall there will be a passenger lift to each of the upper floors. A dining-room will be constructed, 63ft. by 58ft., with oak wainscoting round, broken up by marble pilasters, with panelled ceiling and marble columns supporting the same. New billiard and smoking-rooms are to be provided, and also lavatories and cloak-rooms. A large recreation and ball-room is also arranged, with a stage and ante-rooms at one end, and a winter garden at the other. A gentleman's needle-bath, with dressing boxes attached, is provided in the basement, and with lavatory adjoining. The kitchens will be enlarged and improved. The public billiard-room will be enlarged. The oldest parts of the present house containing inferior bedrooms will be pulled down, and about fifty new bedrooms provided. A new laundry and washhouse is to be built, and servants' bedrooms provided in the same block. The building is to be warmed throughout by hot-water radiators, &c.; fire appliances will be provided on each floor, and fire-escapes at different points. The drainage is to be entirely new.

**LEITH.**—During the past year the building trade in the burgh has been exceptionally busy. A large number of villas have been erected, especially in the Trinity district. Many large tenements and warehouses are at present in course of erection, the latter including the premises of the Cork Company in Easter-road, of Messrs. R. H. Thomson and Co., wine and spirit merchants, Constitution-street; Messrs. J. M. Scott and Co., wine and spirit merchants, Quality-street; the new Cold Storage Company, Tower-street. The Victoria Public Baths and electric lighting station also have been erected in Great Junction-street; while the construction of the North British Railway Company and the Caledonian Railway Company is proceeding apace. The construction of the passenger station at the foot of Leith-walk for the North British Railway Company is well advanced. The Leith Dean of Guild Court have dealt with 156 applications in the course of the year.

**SOUTHAMPTON.**—At the last meeting of the Southampton Board of Guardians an important report was submitted from Messrs. Mitchell, Son, and Gutteridge, the architects, relative to the proposed new workhouse infirmary on the Shirley Warren site. The buildings proposed to be

erected are for infirmary purposes only, and are placed on the highest portion of the site, and for which about one-third of the entire area is set apart. This will provide space for future additions as may be necessary. The remaining portion of the site will be available for other classes of the workhouse, should it ever be found necessary or advisable to remove them from their present location. The buildings now to be erected comprise the following blocks:—Lodge and entrance-gates, nurses' home, observation block, doctors' and matron's block, with committee room, kitchen and stores block, receiving and central administration ditto, two women's pavilions, three men's pavilions, and small maternity pavilion, laundry, boiler-house, mortuary, workshops, sheds, &c. The accommodation will provide 120 beds for sick women, eight for maternity cases, and 184 for sick men. Covered ways connect the various sick blocks with the kitchen and administrative department. The administrative blocks and offices, as laundry, boiler-house, &c., have been arranged and provided to be of sufficient area to take the further fittings wanted to deal with a considerable increase in the number of sick inmates. As regards elevations, the whole of the blocks were shown to be of the simplest character possible, in red brick with slated roofs. The only buildings that can be said to have any pretension to architectural effect are the lodge and gates, the nurses' home, and the main administrative block. These will have a little stonework used, but very sparingly, and will depend for their general effect principally upon their grouping and outline. The estimated cost for the whole of the works enumerated is £65,000.

**WAKEFIELD.**—The new infirmary and steam laundry at the workhouse will be opened on Thursday, the 19th inst. The new buildings will accommodate 150 patients and the staff and servants. They are situated at the rear of the old workhouse buildings, in Park-lane. They comprise in the centre, administrative block. To the left of this block, 42ft. distant, and connected by covered corridor, is the men's pavilion, having three wards respectively, for 10, 20, and four beds, two day-rooms, separation ward, ward kitchen, and stores, also four sets of baths, lavatories, sinks, and w.c.s, in special projecting buildings with cut-off corridors. There are two stone staircases to the first floor, as well as lifts for the patients. The women's pavilion is on the right, and has precisely the same accommodation. The first floor of the administration block contains large maternity ward, two separation wards adjoining, nurses' sitting-room, ward kitchen, stores, bathroom, lavatory, &c. On an upper story there are 13 bedrooms for nurses and servants. The first floor of each pavilion on the west for males and on the east for females has the same accommodation in each case as on the ground floor, with the addition of outside balconies. The workhouse site, old and new, is now inclosed with brick walls coped with worked stone, surmounted by iron railings. All outside walls are faced with Cookson's red pressed bricks, the stone for the dressings being from Huddersfield. The roofs are covered with blue Bangor slates, the floors are of fireproof construction, and are finished with oak blocks in wards and rooms, while the corridors, kitchens, stores, &c., are smooth granite-faced cement concrete. The projecting bathrooms, &c., are faced inside with ivory-white glazed bricks. The plaster work inside throughout is chiefly in parian, having all external angles rounded and all internal ones hollow. The joiners' work has plain chamferings, with rounded corners. The building is fitted throughout with the electric light. There is also erected in the south-east corner of the site a mortuary and post-mortem room. The laundry buildings are over 200ft. long, by 45ft. wide. At the south end is the boiler-house, with its two Lancashire boilers, engine-house, cumulator room, and stores. Next is the washhouse, divided into three compartments, and a corresponding number of receiving rooms, beyond is the finishing room, the drying closets, with flannel drying-room over, and the delivery rooms, while at the north end, with separate approach, is the disinfecting place. The chimney stack is at the south-east corner, and is 150ft. high. The buildings are of the same design and built with similar materials, and in the same manner as the infirmary block. Local contractors generally have been employed. Mr. William Watson, of Wakefield, was the architect, and Mr. John Kelly, the clerk of works.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLII., XLVI., XLIX., LI., LIV., LVIII., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. G. and Co.—S. F.—T. D.—L. M. and Co.—R. O. H.—L. K. and F. Co.—H. A. B.—G. N.

## QUESTIONS.

[12152].—**Architect's Charges.**—May a subscriber to your valuable journal for fully 30 years trouble you with an inquiry as to professional charges on which he would be glad of your experienced opinion? An architect is retained to design and carry out extensive alterations to a large country house of a very troublesome and involved nature. Exhaustive drawings are prepared of every part, showing sections of all rooms with the fittings shown on as working plans; the fittings are afterwards elaborated to gin scale with full-size mouldings, consisting only of moulded fibrous plaster ceilings, dados, ingle fire arches, and chimneypieces, with overmantels—no furniture. Provisional sums are allowed in estimates for these fittings. The works proceed, and as the time approaches for arranging the preparation of the fittings, the owner, without advising the architect of his intention, or questioning in the least his experience and taste, instructs other firms to prepare these fittings of their own design, and, as the architect thinks, incongruous. Although these firms are well aware of the work being in the hands of an architect, they do not communicate with him to ascertain if their work will harmonise with his intentions in any way. At completion the provisional sums are deducted by the architect in checking accounts, and he makes his own charges on the net contractor's work, 1 per cent. being allowed for the troublesome character of the work. The owner, however, disputes the architect's right to charge 5 per cent. on a low nominal estimate of the fittings introduced, there being no account of their cost to hand—indeed, owner declines to allow any sum whatever, notwithstanding designs were made in detail for all, with perspective sketches of portions for explanation. The house being situated at some distance in the country, a charge of 9s. per hour was made on the time only occupied in journeys, exclusive of the time inspecting works. Can this be considered an excessive charge?—or 15 per cent. charge on estimated cost of other additions—a wing, apart from former work, for which plans and designs were made but abandoned? The relations between owner and architect are perfectly good, and there has been no misunderstanding throughout the work. The matter of fittings was carried out in all good faith by owner, and just to gratify his own fancy at the time. In fairness to owner as well as makers of fittings, it should

also be stated that in the provinces there are many so-called architects who have been trained purely as engineers, civil engineers, and surveyors, to say nothing of land agents. These blossom into architects if they can only secure work, and the public are not very discriminating as to any difference between any of these and architects proper. As a rule, the gentlemen referred to find difficulties in preparing elaborate and technical details of fittings of pure design, and appeal therefore to manufacturers for what they require, and wisely, no doubt, in such case. It is possible such has been the owner's former experience, and may be some excuse for the makers of fittings. A copy of scale of architect's charges was sent to the owner. The architect concerned in this statement has had abundant experience of the best work, and has been many years in practice, having been articulated in the early "sixties" to a high-class firm of architects—F.R.I.B.A.'s. He is, however, inexperienced in situations of this description.—ART.

[12153].—**Air-space in Cow Byres.**—How much cubic space should each cow have in a shed?—X.

[12154].—**Dictionary of Terms.—Perspective.**—What is the best and most comprehensive architectural dictionary? Also the cheapest and most concise work on bird's-eye and interior perspective?—INQUIRER.

## REPLIES.

[12142].—**Damp Cellar.**—I should advise the cellar to be lined with Callender's Bitumen Sheeting. See advertisement in "B. N."—ARCHITECT.

[12143].—**Payment for Plans.**—For plans without specifications you can charge, say, 2 per cent.; but if the cost of the villa is small, "Young Practitioner" would be justified in charging by time. The 2½ per cent. includes generally plans, specifications, and details, but the charge should be regulated by the trouble and time involved.—A. B.

[12144].—**Perspective.**—Several elementary treatises are to be had, and there is one in Lockwood's series. Mr. Middleton has published a concise little book on the rudiments of the subject, and the work of J. H. Spanton, Gold Medallist of the R.A., is a very complete course. It is designed to meet the requirements of the Science and Art Department, if that is any recommendation, and is published by Macmillan.—G. H. G.

[12145].—**Factory Chimneys.**—The chimney stack should be built in two thicknesses, stiffened at intervals by ribs of brickwork. A new chimney in New York for the Metropolitan Street Railway Company is 350ft. in height, and is built in two thicknesses. At the bottom of hollow portion the outer thickness is 24in., and the inner 16in., the cavity being 20in. wide. The ribs divide the cavity into twelve parts. The internal diameter is 22ft. The upper thicknesses are respectively 20in and 8in. for outer and inner parts.—A. Z.

[12150].—**Level.**—I believe Stanley sells a useful and compact instrument that would suit your purpose, consisting of a spirit-level about 6in. between an aperture and cross wires. It can be mounted on a stick or tripod, and made to revolve on a graduated plate divided into degrees. For many years I have used such an instrument for taking levels of sites of buildings, roads, &c. It can be easily carried in a side-pocket if furnished with case. Mine has a graduated vertical arc as well, so as to take slight vertical angles or rises of ground.—G. H. G.

[12151].—**White Flooring.**—White flooring is less durable than the "red," both being the same as regards seasoning. Archangel whitewood is in high repute for flooring, as the fibre is of a soft nature, and the wood is free from knots, and can be more easily worked. Redwood, if good, is certainly harder.—G. H. G.

## CHIPS.

Extensive additions are being made to Eton College, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

Mr. L. O. Lathrop, who died at Plano, Ill., December 25, had studied architecture with Mr. J. M. Van Osdel, formerly a well-known architect of Chicago, and assisted in the building of the Tremont and Palmer Houses. He was afterwards engaged in bridge service for the Government.

New lecture-hall and school buildings, in connection with Wesley Chapel, Birkenhead, were opened on Thursday, January 4. Accommodation is provided for over 700 children, the cost being about £3,000. The contract has been successfully carried out by Mr. James Merritt, from designs and under the superintendence of Mr. T. W. Cubbon, architect, of Birkenhead.

Mr. Joseph Lamb, senior partner of the firm of J. and R. Lamb, died at his home in New York last week, at the age of sixty-five. Mr. Lamb was born in England, but went to New York when very young, with his father, the architect of Niblo's Garden. As he grew up he devoted himself to the study of ecclesiastical decoration, and, with his younger brother, founded the firm which has become well-known all over the United States.

Stand Independent Church, near Manchester, erected some thirteen years ago, and recently decorated internally, has just had given to it an oak font cover. It has been designed by Mr. J. P. Pritchett, of Darlington, the architect who designed the church and superintended the decorations, and it has been made by Messrs. Hems and Sons, church carvers, of Exeter. The cover is octagon and of pyramidal form, about 4ft. high, and has on each face two tiers of canopies, with carved crockets and finials, the whole being surmounted by a larger finial.

## WATER SUPPLY AND SANITARY MATTERS.

CALCUTTA.—A scheme for the extension of the unfiltered water-supply in the town area was carried out during the year 1897-98 by Messrs. Martin and Company, at a cost of £54,000 sterling, the work being completed in March, 1898. This has resulted in an extension of the unfiltered water main by more than 15½ miles, the total length of pipe now amounting to 96.50 miles, with which are connected 1,906 premises, 135 public conveniences, 320 sewer or flushing chambers, and 2,973 ground hydrants; 86 bathing platforms, which were formerly connected, have since been severed and connected with the filtered main. Besides this, a second project for extending the unfiltered water-supply in the suburbs is also being carried out by Messrs. Martin and Company. The length of new pipe is estimated to be 221,700ft., and the cost £50,000 sterling. Some delay in carrying out the scheme has occurred, but pipes have been laid along 175,832ft. A site for the pumping station for the suburban unfiltered water-supply was chosen, and the works are being constructed.

The corporation of Much Wenlock have appointed as borough surveyor Mr. W. E. Woollans, at present assistant surveyor to the urban district council of Whitchurch, Salop.

The exhibition in the City Gallery at Guildhall during the approaching season will consist of works in oil and water-colours by Turner, illustrating the various periods of his art and phases of his genius; likewise a selection of examples by deceased artists of the British School, such as Reynolds, Gainsborough, Romney, R. Wilson, Constable, and Ety.

The urban district council of Handsworth have applied to the Local Government Board for sanction to borrow £17,500 for works of sewerage, £15,030 for the purpose of their depot in Queen's Head-lane, £1,000 for works of street improvement, £2,362 for the purpose of the Victoria Park, £2,200 for the erection of a fire-station, and £770 for their refuse destructor in Queen's Head-lane.

The town council of Batley have resolved to erect a town-hall for the borough, and have appointed a committee to make inquiries as to site, probable cost, &c. The idea which finds most favour is that the site should be that at present occupied by the disused market-hall, and that the hill rising from Commercial-street and Wellington-street should be lowered. It is understood that the cost of the scheme shall not exceed £30,000.

Mr. W. O. E. Meade-King, Inspector to the Local Government Board, held an inquiry at Radstock, on Friday, into the proposed loan of £1,700 for the purposes of a water supply, which sum the Radstock Urban District Council have applied to the central board for sanction to borrow.

Messrs. Powell and Sons, of the Whitefriars Glass Works, London, have just erected a stained-glass window in the east end of Mainstone Church, Salop. The subject is the Adoration of the Risen Christ. The risen Saviour stands out in the upper part of the centre-light in His character of Prophet, Priest, and King; in the lower part the child Jesus sits on His mother's knee, with the young John the Baptist kneeling before him, whilst in the foreground a lamb rests in repose.

The new wing of the Longmore Hospital for Incurables at Edinburgh was formally opened by the Duchess of Buccleugh on the 5th inst. It is the third enlargement of the present building, erected in 1878, forms an eastern wing, contains four large and four minor wards, and raises the accommodation from 70 to 100 beds. A new laundry, chapel, kitchen, and mortuary have also been added to the institution, the total cost of the present extension being £25,000.

Two Local Government Board inquiries were held at Rotherham on Friday by Mr. W. G. Willcocks, M.Inst.C.E. One had reference to the gasworks extensions at Rotherham, and it was stated that some £40,000 was required before the town could be placed in a satisfactory condition with regard to its gas supply. The other was an application for sanction to borrow £850 for sewage disposal works at Greasborough. The object of the extensions at the sewage works is to meet the requirements of the West Riding Rivers Board.

Information is now forthcoming of the estimated cost of the improvements proposed to be effected under the Bill deposited by the London County Council. Sir Alexander Binnie, engineer, and Mr. Andrew Young, valuer, estimate the cost, including the purchase of the necessary property, as follows:—New street (Holborn to Strand), £4,862,500; Southampton-row (widening), £272,000; Wandsworth-road, Lambeth (widening), £63,000; High-street, Kensington (widening), £308,500; Cat and Mutton Bridge, Shoreditch (reconstruction), £71,800; making, with other items, a total of £5,591,800. No credit is taken for recoupment by resale of property.

## Our Office Table.

THE vandalistic proposal of a section of the town council of Southampton to remove the picturesque Bargate which spans the main thoroughfare of that otherwise very commonplace county town, is arousing uncompromising opposition from the more public-spirited residents. As Mr. G. D. Leslie, R.A., in a letter to the *Times* points out, an alternative route might surely be devised for the accommodation of tram-cars rather than the destruction of this interesting historic relic, and, indeed, the proposal is under consideration to remove the very ordinary properties on either side, and so leave the gate as an island in the widened High-street. What is the Society for the Protection of Ancient Buildings doing in the matter? On the lowest ground of utilitarianism the gate has a considerable value to the town as an attraction to American tourists and visitors, and we trust the inelastic proposal will be scouted by the Southampton Corporation. Mr. Leslie pertinently asks "With what force can we as an art-loving nation, presume to dictate to the municipality of Florence as to intended street alterations in that city, when such waste of ruthless destruction is contemplated in one of the most famous towns in our own land?"

THE decision of Yarmouth Corporation to erect an overhead electric-light cable, crossing the Harbour at a great height, has excited much interest in electrical circles. The experiment is an entirely novel one in Great Britain, though in the States suspensory communications of the kind are by no means a rarity. The problem the Yarmouth Corporation had to solve was how best to take its electricity to a large population across the river, which is over 300ft. wide. A subway was out of the question, on account of the enormous cost. A submerged cable with the necessary land attachments would have meant an outlay of some £2,000, and been liable to derangement through shipping casualties, and so the borough surveyor (Mr. J. W. Cockrill) hit upon the bold expedient of an overhead cable. This is to be carried across the harbour from a point near the generating station on the South Denes by means of two lofty steel masts which will each be placed 40ft. from the key on either side of the river. The electric cable will be suspended between these, over a clear width of 400ft., while the height at the "sag," in the centre of suspension, will be 170ft. above the highest tides, thus affording vessels plenty of head-room, and doing away with the troublesome necessity of striking their topmasts as they pass up stream. The total cost, including foundations on shore, &c., will be just under £1,000, and tenders have already been received for the erection.

AN aerial tramway is also being employed in the works for the rebuilding of Vauxhall Bridge, the contractors for which, Messrs. Pethick, of Plymouth, have commissioned Mr. J. M. Henderson, of Aberdeen, to carry a suspension cableway across the stream. This consists of a wire hawser 6½in. in circumference, crossing the river with a span of about 920ft. and suspended from two uprights or masts, 77ft. high on each bank. On this cable runs a trolley from which can be hung a load of any desired character up to a weight of four tons. A stationary engine at the Westminster end hauls the trolley forwards and backwards as required, by means of an endless rope, and another rope enables the raising and lowering of the roads also to be controlled from the bank. The apparatus will be employed in removing old material and conveying new into position, and by its adoption the free navigation of the river will be less interfered with than by the extensive stagings which the contractors would otherwise have been obliged to construct.

OWING to the wretchedly dilapidated condition into which the church of St. Luke, Bristol-street, Birmingham, has fallen, the City Council, acting on a report by Mr. John Price, the borough surveyor, have issued a peremptory order for its immediate demolition. St. Luke's is one of four churches erected by the Birmingham Church Building Society nearly fifty years ago, all of which quickly fell into a deplorable condition. The other churches were St. Andrew's, Bordesley, St. Mark's, and St. Stephen's, Newtown-row. These, together with St. Luke's, were built with external walls of soft red sandstone, an interior wall of brick, and a filling of rubble between the

two. St. Luke's, with its unsightly timber shoring, has for some years presented the aspect of a church upon crutches, and recently stones have fallen from the tower through the roof. It has reached a condition past all propping-up, and the closing services were held on Sunday. It has been decided to sell the building materials of the church by tender, in order that it may be taken down as early as possible. Tenders are also to be invited for the purchase of the organ and such portions of the fittings as are not likely to be of further use. The memorial tablets will be carefully removed from the walls and stored until arrangements can be made for their re-erection. Arrangements have been made for the use, during the rebuilding of the church, of an assembly-room in Bristol-street, in the building formerly used as Coldicutt's Mews, and less than a hundred yards from the church. This will be seated with chairs for 500 persons.

At a select dinner-party, given by the ex-mayor of King's Lynn in the card-room of the town hall on Thursday evening, the present mayor being one of the guests, Mr. E. J. Silcock was the recipient of a handsome silver salver, in recognition of his services during the eleven years that he held the post of borough engineer. The gift came as a testimonial from present and past members of the corporation, to whom subscriptions were confined. The salver (which was supplied by Mr. W. J. King, of High-street), bore this inscription:—"Presented to Edward J. Silcock, A.M.I.C.E., F.G.S., by past and present members of the corporation of King's Lynn, in recognition of his services as borough engineer. August, 1898." The plate was accompanied by an illuminated address, with a list of the subscribers.

THE United States Consul at Chemnitz reports that there is a movement on foot to furnish working men with better dwelling-places in Germany. At present they are crowded into buildings which often look like barracks. The proposed houses will be built upon plots of ground about 16ft. 6in. wide by 102ft. deep, thereby allowing for a front yard for flowers and a back yard for a vegetable garden and shed, the latter for the keeping of poultry or some domestic animal. The houses will contain five rooms. A parlour and kitchen will be on the first floor, the parlour containing a porcelain stove and heating-pipes, and the kitchen a wash-boiler and stove. The three bedrooms on the second floor will easily hold five or six persons, and can be made to accommodate ten. In the largest, an iron stove will be placed. A pump will provide water where the city waterworks do not extend to the house. The cost of such a house and plot of ground when a number are built at a time will be between £170 and £190. They will let for about £9 a year—that is for the same price the working man has to pay for two rooms in the barrack-like tenements of the large cities.

### MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Award of Prizes and Studentships. 8 p.m.  
Society of Arts. "Bacteriological Purification of Sewage," Cantor Lecture No. 1, by Dr. Samuel Rideal. 8 p.m.

WEDNESDAY.—Society of Arts. "Canals and Inland Navigation in the United Kingdom," by L. F. Vernon-Harcourt, M.A. 8 p.m.

THURSDAY.—Society of Arts. "Railways in Burma and their Proposed Extension Across Yunnan," by J. Nisbet, Imperial Institute. 4.30 p.m.

FRIDAY.—Architectural Association. "Ancient and Modern Buildings in Palestine." By Beresford Pite, F.R.I.B.A. 7.30 p.m.  
Glasgow Architectural Craftsmen's Society. "The Housing of the Working Classes," by Peter Fyfe, F.R.S.E. 8 p.m.

### THE ARCHITECTURAL ASSOCIATION.

JANUARY 20th.—ORDINARY MEETING, at 9, Conduit-street, W. 7.30 p.m. Illustrated lantern lecture, "ANCIENT AND MODERN BUILDINGS IN PALESTINE," by MR. BERESFORD PITE.  
E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

The partnership heretofore subsisting between T. Cox and R. Marmon, architects and surveyors, Liverpool, under the style of Cox and Marmon, has been dissolved.

The new board schools, Conisborough, near Rotherham, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied Messrs. E. H. Shorland and Brother, of Manchester.

## Trade News.

### WAGES MOVEMENTS.

SETTLEMENT OF THE SCOTTISH FURNITURE TRADE DISPUTE.—After continuing over ten months, the dispute in the Scottish furniture trade was amicably settled on Friday at a joint conference of employers and operatives, held in the Religious Institution Rooms, Glasgow. Six representatives were present from each side. These representatives were:—For the Scottish Furniture Manufacturers' Association: Messrs. Joseph Johnstone, Lochwinnoch; W. A. Wylie, Glasgow; A. Thomson, jun., Glasgow; John Stevenson, Beith; George Taggart, Glasgow; and Robert Balfour, Glasgow and Beith. For the men: Messrs. John Reid, Alex. Gossip, James Innes, Sutherland, Macleod, and Tank (London). Mr. Joseph Johnstone, Lochwinnoch, presided on behalf of the employers, while Mr. John Reid acted in a similar capacity for the men. Mr. Alex. Russell, writer, secretary of the Scottish Furniture Manufacturers' Association, was also in attendance. The men's representatives conceded the principle of piece-work on "repeat" work, on the understanding that prices would be fixed by collective bargaining. At first, it is understood, the men contended that prices should be fixed for districts as a whole; but, after a deal of discussion, they agreed that prices should be fixed in shops. They also strongly requested employers to allow operatives the liberty of objecting to or accepting piece-work at pleasure. The employers, however, declined to agree to this.

DUNDEE.—The Dundee operative painters have been granted an increase in their wages to the extent of ½d. per hour, to take effect from Monday last. The standard rate of pay will now be 8d. per hour.

### CHIPS.

On Monday, the North Staffordshire Railway Company opened their double line between Clifton and Ashbourn for passenger and goods traffic. This is the completion of the first part of the double line it is the intention of the company to make as far as the Churnet Valley Junction at Rostech.

The hospitals committee of the Leeds Corporation visited, on Friday, the fever hospital at Manston, and, along with the consulting architect, Mr. H. E. Hall, of London, went over the Killingbeck Hall estate, which was recently purchased by the corporation at a cost of £21,250, for the purpose of being used as a site for the proposed smallpox hospital.

At the parish church, Cleve, Somerset, on Friday, a window, which has been erected by the Alford family as a memorial to the late Rev. Charles Richard Alford, D.D., sometime Bishop of Victoria, Hong Kong, was dedicated. It is in the north transept, and consists of two lights with one subject, "St. Paul preaching to the Corinthians," the features of the late Bishop being copied by the artist to represent those of the great Apostle. Above are the figures of angels bearing scrolls. The floral ornamentation and general style is Early English, which is in keeping with the rest of the church. The artists were Messrs. Joseph Bell and Son, of Bristol.

The new wards of the Hampstead Workhouse, extending from the old building in New-end to the corner of Heath-street, were opened last week. The new buildings have been erected, from designs by Mr. Keith D. Young, by Messrs. Gough and Co., the builders of the Central Library. They are lighted throughout by electricity. The buildings, which have cost £20,000, are to be supplemented by important alterations in the older portion of the House, some parts of which date from the early years of the present century.

A memorial-window to the late Mr. J. T. Meredith, architect, was dedicated at St. George's, Kidderminster, on Sunday evening, when the Mayor, members of the corporation, and a large number of Freemasons attended. The window, which is in the west end of the church, has been given by Mr. J. Pritchard, who was for many years with Mr. Meredith.

At Catrine, Ayrshire, a new village institute was opened last week. It has been built by local contractors at a cost of £3,000, from plans by Mr. R. S. Ingram, of Kilmarnock.

### ACTUAL AND IDEAL STRUCTURES.

CERTAIN standards of construction have become the common property of the architect in all ages. Partly based on theory and partly on practical experience, they have been accepted as models, as the very foundation of architectural construction. Such have become the beam or lintel, the arch and the truss. Each of these elements has undergone modifications and developments in the light of new discoveries and materials. Thus concrete and iron or steel have been combined in the construction of beams, and greater strength has been obtained by this combination than the beam of stone or timber alone could give. The conditions of the arch have been investigated, and we have now arches composed of iron ribs or concrete and metal combined that give greater results than the old stone voussoir arch. Some recent experiments on full-sized timber trusses, made by Major G. K. Scott Moncrieff, R.E., late instructor in construction at the School of Military Engineering, Chatham, the results of which are published in the *Journal* of the R.I.B.A., are of interest. They were undertaken to ascertain whether roof timber trusses used for the support of ordinary roofs, according to the dimensions generally accepted, had any practical advantage over trusses designed in accordance with theory. Tredgold's treatise on carpentry has been taken as the authority on the subject, and the scantlings he has given have formed the standard of all textbooks. It was adopted as a textbook by the Engineer Department in 1844. Even Tredgold, however, observed that in practice roofs were made too heavy, and that the same roof could be constructed with a smaller amount of timber. Major Scott Moncrieff traverses the ordinary practice. He takes an ordinary king-post truss and shows that the section of principal rafter is made of much smaller scantling than the tie-beam; that the struts are very light and their centre axes would intersect at a point above the tie-beam; that the purlins are not vertically over the struts, and that the tie-beam and principal are connected at the heel by a strap fastened by a small bolt; in the queen-post truss, also, the straining beam, though thicker than the principal, is not so thick as the tie-beam. The writer shows the theoretical unsoundness of all these points. For example: (1) the stress borne by the principal under any loading is greater than that borne by the tie-beam, as may be seen by drawing the triangle of forces at the junction; (2) the stress on struts depends on the load: if it is greater on one side, the strut on that side will have a greater stress, and both bending and shearing stress will be set up at the foot of king-post which it is not designed to resist; (3) when the purlins are not directly over the struts, eccentric stress is caused in them, and they will fail the sooner by lateral flexure; there will also be combined stress set up in the principals; (4) the small size of bolt to heel-strap is an objection, as it transmits the greater part of tensile stress of the tie-beams, and its bearing area on tie-beam is not sufficient to prevent the crushing of fibres. (5) The scantlings given to straining beams are insufficient for the stress in many cases. These conclusions are sound, at least, in theory; but it is necessary to consider on what bases Tredgold formulated his tables of scantlings. These were limited. He premised a certain distance between trusses (10ft.), a certain pitch or angle of

roof (27°). Memel or Riga timber, and a covering of slate.

Moncrieff's experiments were undertaken for the purpose of discovering general rules or formulæ for giving scantlings for roofs under any circumstances, and especially for finding the results of tests upon both the old kind of trusses and the modified or theoretical truss the author proposes. To this end the joints had to be reconsidered. Instead of Tredgold's solid tie-beams, a double one is substituted. The joint at bottom of principal was secured by a horizontal iron strap, while the stress was a minimum. The tie-beam is in two pieces, one on each side of principals, and the bolt securing the strap is passed through a block of wood between the halves of tie-beam, and this block is partly housed into the two halves to prevent it slipping.

We refer the reader to the article in the *Institute Journal* for the description of the experiments. These were based in accordance with Tredgold's rules as to distance apart; the weight of roof covering was taken as 40lb. per square foot, or 400lb. per foot run of slant, and in a 28ft. span the load would amount to 12,800lb., taking 32ft. as the length of slanting rafter. Half this load would be borne by the purlins, the other half by the pole-plates, thus each purlin would bear 3,200lb., or with a margin of safety of 12,000lb., and these were the pressures put on the test-trusses. Taking the usual pattern of king-post truss 29ft. span, but with tie-beams and principals of the same scantling, it was found when the pressure reached 12,000lb. on each side, the end of tie-beam sheared off, and the plates above and below crushed into the timber with a pressure of 5,000lb. to the square inch. On one side the straps were doing all the work in resisting the thrust; on the other side the strap was not so tight, and the stress came on the timber joint. The next test was on a truss of the same span, but of the theoretical type, with double tie-beam of planks 5in. by 1½in., with horizontal strap and 1in. bolts and end blocks, but the strap square at end. The truss soon failed; at about 7,500lb. on each side the pressure bent the straps and split the wedges, thus showing that the semicircular form of strap was the stronger one. The third test was upon a truss of 28ft. span, according to Tredgold's tables, with principals 6in. by 3½in., struts 4in. by 2½in., tie-beam 11½in. by 6in., and king-posts 6in. by 4in. It showed weakness at 6,000lb. on each purlin; the struts buckled and crushed the fibres at foot of king-post. At 7,500lb. on each side, one of the bent principals split at a tight knot. The compression members were weak also, as the struts buckled in the direction of their least thickness. The third truss tested was of the same span, but the dimensions were according to theoretical principles. The principals were 5in. by 6in., the struts 5in. by 4in., the tie-beam double, of 8in. by 2in. planks, king-post 5in. by 2in. The truss failed at pressures between 11,000lb. and 12,000lb., but the test compared favourably with the Tredgold previously mentioned, and there was a saving in cost. The author says: "Truss No. 3 failed under a load equivalent to 75lb. per square foot of roof, while the last had borne, without failure, a weight corresponding to a uniform load of 137lb. to 140lb. per square foot."

Other tests are described, to which it is needless to refer. Valuable as these experiments are, they appear to leave out of account certain conditions that exist in actual roofs. In these tests the trusses were separately submitted to pressures at certain points; but, in actual roof-trusses, the load is more equally distributed. In most of the tests recorded, the trusses were laterally buckled, owing to the absence of purlins. These, as fixed in a building, materially stiffen the frames and distribute the load on

the roof, another condition is unheeded. The deep tie-beam of Tredgold's truss is a practical requirement where there is a ceiling.

But in other respects there are reasons for modification. The usual iron strap securing principal to tie-beam is sadly defective, and the bolt is often too small to make any adequate resistance; the struts are often too thin in one direction, and the joints of king-post and struts under an eccentric load would cause flexure and shearing in the post.

A very important conclusion to be derived from these experiments is that the failure of a roof-truss is to be attributed often to some accidental circumstance, like a knot in a principal or strut, or the shrinkage at a joint, by which more pressure would be exerted at one point, causing crushing or unequal stress. The importance of being able to tighten up a joint, as that between principal and tie-beam, is important. Experiments of this kind would be of more value if adequate means could be devised to prevent lateral deflection, or the entire buckling of the structure; the means used to secure this by means of stays, blocks, and tackle are not sufficient. Another point is the want of rigidity, or fixing of the ends of truss, as they would be in a building, as such fixed ends would naturally assist to prevent deflection. We refer the reader to the report and formulæ for calculating scantlings given in the appendix, and for the kind of apparatus employed in these tests.

### MODEL SPECIFICATIONS.—XLVIII.

SINKS, LAVATORIES, AND BATHS.

AS a full and exact specification of fixtures like baths, lavatories, sinks, and their traps, wastes, and overflows is very necessary, we have devoted some space to the subject. A good slop-sink should have the essentials of a well-flushed closet. The sink should have a good basin, deep enough to prevent splashing, and one of lead or cast iron is best. There should be a self-cleansing trap below the basin. Dent and Hellyer's "water shoot" is a good form, and is made of cast iron enamelled on the inside, and fitted with a strong white glazed stoneware screener. Doulton has also an excellent corner sink of glazed stoneware top with slate skirtings; the basin and siphon are of iron, and it is provided with a flushing valve. Our sketch (1) represents a corner arrangement well suited for general work, with draw-off and flushing-taps, and a cleansing cap on top of trap. Many firms who supply plumbers' fixtures have arrangements of this sort. The sink is of enamelled iron, basin, and trap, and has a 3in. waste-pipe. The trap has a brass grating to exclude solids, &c.

A complete slop-sink should have hot-and-cold water draw-off taps and a flushing tap.

Pantry and scullery troughs should discharge in the open air, or over a disconnecting receiver-trap. The lead lining of lead troughs should give room for expansion and contraction to avoid buckling.

An ordinary scullery-sink should have a 1½in. or 2in. waste-pipe discharging over a trapped gully with good seal. We show a sink waste made by Duckett (see sketch) with a 2in. waste-pipe, made of glazed enamelled ware, with "Stanford" joint to trap and with a brass grating in the sink. The pipe from sink is made in two parts, the upper of brass soldered to grate, and the lower part of lead, into which it is telescoped. The outlet can be turned in any direction. The upper pipe and trap can be removed for cleaning. Pantry sinks in butlers' pantries should be lead-lined, as being not so hard, and less liable to damage glass or china. A depth of 16in. is necessary. The angles should be rounded off by fillets for the lead, and 8lb. lead is recommended for the sides and 10lb. or 12lb. per foot for the bottom. Provide a

countersunk washer with back-nut and plug, and a drawn-lead siphon-trap with cap and screw (see sketch 2).

We refer to our remarks on sinks and lavatories, p. 52. Lavatories of iron are enamelled and galvanised, but are not so cleanly-looking as stoneware and porcelain; besides which, there is in the latter nothing to scale off or oxidise. Stoneware basins are made in one piece and fixed on slate slabs, or the whole basin and slab are in one, with dishings for soap, brushes, &c. The makers we have named turn out many admirable lavatory fittings.

Bib or push-taps are used; some basins have flushing rims. The waste from basin should allow of rapid discharge, and 1 in. to 1½ in. diameter pipe is usual, and should be trapped immediately below the basin, the pipe delivering outside house. If several lavatories are necessary, each waste should be trapped before passing into common waste, this being carried up for ventilation.

Sketch 2 shows a waste and siphon trap, lead-drawn, suitable for a lavatory or sink, with cap and screw for cleansing; and sketch 3 is a plug waste and trap combined, for a bath. It has a washer back nut and

overflow and trap. Sketch 5 shows a flap (Hellyer's) for rapid emptying. Sketch 4 is a bath showing an arrangement of trap,

union. If from a catalogue, specify the description and No. of lavatory, and in all cases specify diameter of waste, its weight per foot, where carried, the kind of trap, if with cap, and overflow, the material of top, thickness, skirting, &c.

Copper baths should be supported on a wooden framework to prevent any alteration of shape. They are enamelled, which is not a very desirable covering. Zinc baths also require support, and are painted or enamelled. The objection to iron baths, especially cast-iron, is that they look dirty after a time; but they are stronger than zinc, and require no wooden framing. Porcelain-glazed baths in one piece have many advantages, and are smooth and cleanly; but block tin and copper baths are generally used. In specifying baths, provide for a 5 lb. lead safe of the full size of bath, with overflow, for which purpose the floor should be furred and boarded to form a slight fall; also a bath waste of 1½ in. or 2 in., discharging outside wall into open channel leading to a self-cleansing gully. We show in section 6 a form of valve for emptying bath made by Mr. Jennings, combining

waste overflow, and ventilating pipe for preventing the unsealing of trap.

63. *Lavatory Basin*.—Provide and fix in lavatory or dressing-room a circular enamelled ware basin, with chain-pull attached to lever of waste-valve, with water-tight seating, with skirting, marble (or slated) top complete. Lay on hot and cold ½ in. or ¾ in. supplies through horns on opposite sides of basin with flushing rim, with ½ in. lever or screw-down valves fixed to wall. Lead an air-flow pipe to open air. Or—

The fixed washstand-basins in lavatory or bedrooms to have 1 in. waste-pipe anti-D trap, with grating of full bore to waste-pipe. Provide a 1 in. round-way cock between grating and trap with handle and lever, and lay on ½ in. hot and cold supplies at sides of basin, discharging through flushing-rim with screw-down valves, with handles fixed on casing to satisfaction of architect. The basins to be D-shaped earthenware, with skirting, dished for soap and brush-traps;—if with hot or cold douche arrangement, state so.

64. *Butler's Sink*.—Line the butler's sink with 6 lb. (or 8 lb.) lead soldered at angles, turned over upper edge, and copper nailed. Fit with 2 in. pantry-washer soldered in, and plug and brass chain, and take 2 in. waste (middling quality, 18 lb. per yard) through wall to deliver over gully grating, and provide a 2 in. Du Bois trap with 2 in. brass cap and screw for cleansing.

65. *Draw-off Sink*.—Line deal draw-off sink on landing with 8 lb. lead, bottom turned up against

walls 18 in. and over angle fillets on floor, close copper nailed. Take 1½ in. waste pipe (9 lb. per yard), and 3 in. brass grating, through wall discharging over hopper head. Or—

Fit up in housemaid's closet on floor level a deal sink 2 ft. 6 in. by 18 in. and 3 in. deep, lined with 8 lb. lead, copper nailed and bossed and soldered, the lead taken up 3 ft. at back. Lay on water to same with ½ in. supplies from nearest hot and cold service to strong gunmetal quick-turn, screw-down, full-way bib-cocks. Fix 1½ in. brass

grating and rim, and 1½ in. S-trap, with 1½ in. waste, with vent-pipe, &c., complete.

66. *Slate Bath*.—The bath to be 5 ft. 6 in., of tapered shape, 1 ft. 10 in. deep, made of lin. Bangor slate slab, sides and end lin.; and 1½ in. slab bottom rebated together in lead cement, and bolted with four ¾ in. galvanised-iron bolts, nuts, &c. Or—Provide and fix one of Young and Marten's slate-slab baths.

(Describe waste overflow traps, &c., as before.)

67. *Copper Bath*.—Provide and fix complete a tapered copper bath 5 ft. 6 in. long, with flanged brim, circular end, with copper hot and cold supplies, overflow, and waste, and 3½ in. copper gratings, with 2 in. full-way screw-down valve, 2 in. lead S-trap in waste, and connected to 2 in. lead pipe, to discharge over hopper head; overflow pipe, with copper grating. The lever fittings "hot," "cold," and "waste" to be selected, or allow p.c. sum for same. Or—

The bath to be Nicholls and Clarke's "Como" best quality, enamelled, with mahogany capping, and combined fittings complete for "hot" and "cold," and lift-up waste, p.c. £7 15s.

68. *Bath*.—Provide and fix in bathroom one of Doulton's (or Dent and Hellyer's) best white-glazed porcelain baths, 5 ft. 6 in. long, fixed in deal bearers. Put in 2 in. lead waste with siphon to hopper outside wall, with brass union and porcelain (or brass) grid, with a 2 in. full-way brass stop valve. Take a 2 in. overflow into waste pipe, with porcelain (or brass) grid, and fit up lever handles for "hot," "cold," and "waste." Or—

The bath to be a cast-iron enamelled taper-shaped bath, 5 ft. 6 in. long, with circular end and dished bottom (or to be supplied by Messrs. Young and Marten, Stratford, No. — in catalogue), with 2 in. full-way screw-down valve, S trap, overflow, and waste with all fittings, and connected complete.

Lay on hot and cold service, 1 in. branches, and connect to supply valves. Put in a 2 in. lead trap

under bath and waste, and connect to main waste. Ventilate trap by an anti-siphonage pipe of same size as waste, and provide under bath a 4 lb. (or 5 lb.) lead safe of the full size of bath, with overflow pipe to discharge outside. (The floor to be blocked up with a fall of 1½ in. in 5 ft., rough boarded, with small gutter for dressing lead.)

69. *Superior Copper Bath*.—Fit up in bathroom a strong tinned copper bath, 5 ft. 6 in. long, on deal framed cradle with circular end enamelled white (or ivory), with copper pipes for hot and cold supplies, overflow, and waste, and 3½ in. copper grating (or with large copper under waste, and extra large waste-valve), 1 in. nickel-plated hot and cold-supply valves, complete, p.c. (Or, put 2 in. full-way, screw-down valve, 2 in. lead S trap formed in waste, and take 2 in. lead discharge-pipe outside; also a 2 in. lead overflow, with 3½ in. grating, and connect to waste). Allow p.c. sum of £3 10s. for bath fittings to "hot, cold, and waste." Or—

Lay on hot and cold supplies in 1 in. branches, and connect same to supply valves, with 2 in. lead trap under bath, and 2 in. branch waste. Put in a siphonage pipe to ventilate trap.

Provide and fix 1½ in. French-polished mahogany top, with rounded corner framed to bath, with rounded nosing, and fix round 6 in. by ¾ in. skirting round wall, and inclose space below with 1½ in. mahogany framing, with hinged panels, &c., complete.

70. *Movable Bath*.—Provide a copper (enamelled green inside) taper bath, 5 ft. 6 in. long, with circular ends, dished bottom, and with roll rim, p.c. £11. Or—

The movable copper bath to be 5 ft. 6 in. long, with circular ends and dished bottom, with large roll edge (3 in.) with ½ in. copper waste-pipe and ¾ in. screw-down gunmetal bib-cock, fitted on wheels in a wrought-iron frame complete.

71. *Zinc Bath.*—Provide in bath-room a taper, flanged top zinc bath, with wood casing, japanned white or green inside, fitted with copper pipes for hot, cold, and waste, and copper overflow in extra strong zinc, or Nicholls and Clarke's (or Young and Marten's) bath No. — in catalogue, p.c. Or—

Provide extra strong zinc japanned bath, with small lengths of copper pipe for hot and cold supplies, waste and overflow, 5ft. 6in. long, with 2in. full way screw-down valve, 2in. lead S trap in waste, and 2in. waste-pipe to discharge over hopper head, &c., complete.

72. *Rising Main.*—Take from company's main lin. pipe and lin. brass high-pressure equilibrium ball-valve, with copper ball and stem, and lay on water to cistern A. From last pipe lay ½in. pipe and similar ball-valve to cistern B.

73. *Supplies.*—Lay on water to scullery sink from cistern A, with ½in. brass cistern connector, ½in. pipe, and ½in. bib-cock.

Lay on water from last with ½in. pipe and bib-cock to housemaid's closet.

Lay on water from cistern B with ½in. connector as before, and lin. pipe to angle of bedroom No. —, thence with ½in. pipe and bib-cock to butler's pantry sink.

Lay on water from last to bath with ½in. pipe, and lay on from last with ½in. pipe and patent ½in. electro-plated self-closing tap to lavatory.

Fix below each separate supply-pipe a d near cistern a brass high-pressure screw-down stop-cock, with union at each end, and a similar stop-cock to rising main near area or in basement.

74. *Waste to Sinks.*—Provide and fix to all sinks on ground floor Duckett's patent waste-pipe, 2in. diameter, of glazed enamelled ware, with airtight "Stanford" joint to trap and pipe, with 2in. brass (or ware) grate, lewis and set in cement; the outlet of waste-pipe to be hooped with cast-iron (see sketch 7.)

#### "BUILDING NEWS" DESIGNING CLUB.

##### A VILLAGE SHOP AND POST-OFFICE WITH COTTAGES.

WE do not like any of the designs submitted for this block of buildings, because we cannot consider any one, out of the nearly fifty proposals received, really a success. The drawings, strange to say, taking them as a whole, have seldom, if ever, been of a higher or more equal degree of merit; clean, crisp, and honestly well done, though many of them, as designs, however, are ineffective and commonplace. It may seem to the members of the Club that, by objecting to all their proposals in this fashion, we are disparaging their work. Obviously, if progress is to be made, the truth must be told, and, in our opinion, we are bound to say that not one of the designs received is up to the mark. The first place is given to "McGilligan," the second to "Thistle," and the third to "Nothe."

The conditions issued to competitors were as follows:—"C.—A Village Grocer's Shop, including a Post-office, with residence attached. On either side of the shop, which may project in the centre not more than 5ft.—there are to be two cottages. The general frontage line of the whole block to set back 20ft. from the forecourt-line, the space in front of the shop being left open to the pavement without a boundary wall, which is to be shown to inclose the gardens in front of the cottages. The house forming part of the shop premises to have a living-room 14ft. by 14ft., or of that area; a kitchen, scullery, &c., and four bedrooms, a bath-room, box-room, and linen closet. To the rear of shop there is to be a store, 20ft. by 15ft., the width of the shop. Each of the four cottages to have a living-room, 14ft. by 12ft., a kitchen, scullery, larder, bath space, w.c., and coal-place. Each dwelling to have its own rear yard, inclosed by walls 5ft. high, 18ft. deep, and the width of the tenement. The cottages to have three bedrooms each. The style of these buildings to be adapted to stone walling and slate-slab roofing. Windows to be metal casements in wooden mullions or frames. Chimneys to be in red brick. The upper-floor walls may be roughcast throughout, or in part. The group must be picturesquely treated in a plain, inexpensive, and countryside way. The end cottages may project if desired. The ground-floor line is 18in. above the pavement. Ground-floor rooms 10ft. pitch, first floor, 9ft. Scale, 8ft. to inch for elevations and sections. Plans, 16ft. to inch. A view of block is essential."

"McGilligan's" design fails to realise the ideal simplicity so essential to the effective contrivance of a countryside group of cottage buildings, and he has not grasped the notion of a row of dwell-

ings of this class in anything like an adequate way. His houses are planned with no relation one to the other, being merely so many individual tenements strung together; the divisional walls are party-walls certainly, but there is no endeavour to economise the chimney-shafts or group the planning of the parts as an essential whole. Each house is schemed without reference to the other, and it becomes a matter of accident that the block only includes just so many and no more. Any number could be added without spoiling its completeness, if we may use so inappropriate a word in describing such an unfinished scheme. The result is restless and toy-like, the latter quality being brought more into evidence by the view, which gives a sort of Chinese effect by curving the bargeboards. The shop-front is as commonplace as it can well be, and very little attempt has been made to broaden out the central feature suggested by the shop and residence attached to it in the middle of the block. The entrance vestibule assumes too much of the character of a hall, and the stairs leading up to the first floor would be very dark. The bath should have been arranged out of the scullery, so as to get, for one thing, all the plumbing work close together. Parlour houses of this class are not villas, and workpeople in the country naturally have different habits from the smug respectability of the ordinary clerk's home in the suburbs. Every inch of room in either case is of the utmost consequence, and "McGilligan's" wasteful landings on the first floor only furnish another instance of his want of attention to details. The squat effect of his chimneys is brought out by the perspective and the hard, tin-like outline of his trees in silhouette is no advantage pictorially. Still, we place him first, and our sole reason is that no better choice is open to us. At any rate, he has made an effective-looking sheet. That, however, is not, and should not be, the prime consideration, and it has not for that reason unduly had our favourable consideration.

The same remark likewise applies to "Thistle's" contribution, though we are bound to admit that his draughtsmanship insures a very attractive result, which demands at least a sufficient recognition at our hands. In some respects his design is preferable to "McGilligan's," but, like him, he has committed similar mistakes by making his cottages too much like semidetached villas stuck on to the post-office shop in the centre without much notion as to the grouping of the whole. The sketch view emphasises this want of unity, and the strong dominating vertical lines brought about by the stores building, which is made to divide the block instead of uniting it, are considerably aggravated by the placing of the otherwise very attractive young lady in the picture immediately below the corner of the shop, thus bringing this objectionable vertical line right into the foreground with fatal effect to the composition. The locating of the grocer's house on the first floor is a mistake, necessitating a needless amount of labour, to say nothing of the inconvenience of the staircase, which is not at all well placed. Every time the shop-bell rings, unless a person is always on duty, it will be necessary to run up and down from the first floor. The position, too, of the post-office counter, right away from the window, is not a good one. With regard to the cottages, there are obvious objections, one of which is the absence of any inclosure for the bath. It ought to be in a place by itself, no matter how small. In the scullery, as "Thistle" puts it, the bath would be in the way, and probably in the majority of cases would be filled with rubbish, or kettles and saucepans. The exterior treatment we have already remarked upon. Another point of objection not mentioned is the similarity of the two doorways to the central block, the only distinction being the proximity of the letter-box.

"Nothe," the third man, is somewhat commonplace. His shop plan is the best of the lot, though the telegraphist is poked away in a dark corner. Still, there is considerable ingenuity in the arrangement which leaves the shop proper—less encumbered by post-office customers. The store, too, is better, and the other parts are conveniently contrived. The head-room at the entrance of the cottages under the stairs would be very low, and there is a loss of space outside the bathroom door. The bath ought to be reached from the scullery, and not be put in the front of the house.

The fourth place is contested for very strongly by three or four designs of very nearly equal merit. "Tokio" is so unequal that, had it not been for the spirit displayed in his drawings and

the general breadth of quaint simplicity illustrated by his contribution, we should have put him lower in the list. For these points of merit we place him fourth. His scheme is too expensive, the living-room windows are too small and too low down in the rooms. The circular lights to the smaller bedrooms in front are not good, the houses are contrived too much like villas: the bathrooms should not be upstairs, there is too much stonework about the fronts, the arched porches are over-ambitious and costly, the shop-front is ugly and very ordinary, the staircases are very dark excepting to the end houses, and the arched roughcast recesses along the front are meaningless. With this indictment "Tokio" may see why we have not placed him higher, though the other competitors may be inclined to question our choice in locating him fourth. Anyhow, "Tokio" has sent in so pretty a scheme, speaking of it as a whole, that we wonder why he did not do very much better. "Swan" is a clever contributor, and his row would look exceedingly well; but we do not like his plan with the cottages only one room thick where the parlours occur. The roof-space is not economised sufficiently. "Pup" is a coarse draughtsman and a crude planner; but he has sent in a simple and tasteful scheme which, on this account, has much to recommend its adoption. His front doors are odd with muntins wider than the panels. The baths in a recess facing the kitchen fireplaces would never do. "Casual," at any rate, has had the good taste to group his buildings ingeniously, and any village would be graced by the erection of his design. Few proprietors would care to adopt his plan, however, which is contrived without much regard to the habits of cottagers. The staircases are very dark. "Quadrant" puts a very large roof, without utilising the enormous unoccupied space which it incloses. The wide eaves are useful and effective, but overdone; the thin, battered buttresses are odd and objectless, and the almost straight-sided Gothic arches above the doorway pents do not add to the merit of the elevation, which is carefully and spiritedly drawn. "Quadrant" is so good that we cannot understand why he was not more successful. "The Old Firm" is fanciful, and by no means lacking in a sense of the picturesque, which, however, is too obviously intentional. Massive masonry to smaller features like dormers and bays may be all very well, but the scale thus adopted ill accords with the thin treatment adopted by the author in roughcast for the end gables, which are finished off with only a tile creasing, not even a bargeboard. "Delia" overshadows his cottages by the needlessly big façade of the shop block in the middle of the row. The plans of the cottages are but repeats of ordinary suburban speculators' houses. There is only a space of about 2ft. to pass the foot of the staircases next the angle of the living-room wall. Notwithstanding such oversights, "Delia" sends a reasonable sort of design. The bedrooms are too low where the eaves come outside. "Bat" hits off a better plan, and his cottages are more reasonable. The elevation is thin-looking in effect, due to the wiry drawing. The post-office is much too large. "Bat" will improve. "Bedouin" has not learned the charm of that unassuming grace so essential to countryside architecture, if such a term can properly be used. Building, simple building, and no trimmings, is what is wanted. "Bedouin" is rightly plain; but, in spite of his plainness, the mullioned windows, curved shop-fronts, arched porches, and projecting bays look out of place appearing very smug, and entirely out of harmony with primitive ways of living. "Espoir" comes next, drawing carefully, and seriously doing his best. Broken party-walls on plan are not good, and not cheap, and this is the index to his design—it is not simple enough, though his work is by no means devoid of merit. "Claude" is better in this respect, only that his plans, with the eternally-recurring narrow side-passage and stairway facing the front door, do not harmonise with the façade. It is this effort after façades which ruins so much endeavour. The aim should rather be a good suitable plan, and then bespeak the plan in what the old builders used to term the "uprights" of the building. A passage in a cottage is not wanted. The whole house is far too small to spare a room for show purposes. The living-room should lead direct out of the kitchen. "Scruton" imitates a row of almshouses, and for the shop has Ionic columns to flank the window and the entrance. In the front of the village green he shows the village stocks. Both are out

of place, and so likewise is the arcaded treatment shown for the walls of the shop inside. "Scruton" sends a very good plan, and his building would look very nice with its ashlar walling and pedimented bays, but he has missed the object we had in view. He is too palatial for the present purpose. "The Auk" is far more in accord with the general spirit of village cottage-work. His drawing, done in brown ink, is spotty and poor, and the plan dodges about too much; some houses have kitchens in front and some behind. The elevation is rather good, but the drawing makes it look common-place. Here is the "rub" to design a simple, unpretentious, untrimmed, and inexpensive row of small dwellings, and yet impart a degree of taste and quaintness to render the work interesting and devoid of common-placeness. "Vigorina" is pretty and well drawn in a neat way, but it is wanting in "go."

We thus come to the class of designs which take second rank. "Le Nord" is one of the best, mainly on account of the grouping of the elevation. It is not a good plan to cut out the drawings as "Le Nord" has done, and paste them on a sheet of paper. "Rats" is too ambitious with cusped half-timber work, and shaped heads to the window and door openings. His view is a spirited performance, though it looks a trifle stagey. His house plans are of the villa type already objected to. "Notts" adopts the birds'-eye method of perspective, and sends in a plain design having a canted angle-ways square bay rather meaninglessly introduced at the ends of the front. "Brush" draws neatly, but in an uncertain style, leaving out his constructional lines in a patchwork way. He ought to improve upon this mannerism, which is not effective. "Rikki" shows common sense and a tasteful regard to simplicity. His failing is due to a want of care in good proportion. Thus the odd-shaped gables at the end are spoiled by their stilted look, and their shape is due to no evident advantage. "Astragal" makes a neat, but very modern row, and by this expression we mean to say the effect is stereotyped, lacking the spirit of the old, and yet not objectionably uninteresting. The plan is rather good. "Butts" deserves a line of commendation, reading into it much that has been said about the last named. His perspective, with the tumble-down fence in front, is not very effective. "Dachs" sends houses much too large, and so misses the position which his ability otherwise would command. "Arc" has a sense of unbroken quaintness; but the shop-front, and the way in which the shopkeeper's house is designed spoils his scheme. His chimneys are paltry. "F." has distinct merits, but little sense for good proportions, and queer drawing quite spoils the real effect which the eaves in his design would produce. "Alexem" has the objections alluded to in describing the design placed second, but he comes a long way behind the merits of that scheme. His sketch is very crude. "Carlo" is a poor draughtsman, but exhibits an appreciation of picturesque and well-grouped outline pleasingly contrived. His design, though plain in detail, would be expensive on account of its diversity of roofing. The third class of designs group themselves in the following order:—"First Attempt," "Dick," "Tie-Beam," "Don't Know," "Dodo," "Indian Ink," "Brown Bread," "Balbus," "Hoopoe," "B. Gyn. R.," "Jabez," "King Crow," "La Poupée," "Jonnie," "Gargoyle," and "Athos."

#### THE INSTITUTE STUDENTSHIPS AND PRIZES.

THE Soane Medallion and £100 was offered for the best design for a concert hall to seat 2,500 persons. The site given was oblong, with streets on all the surrounding sides. The designs submitted for this prize are of various merit: only one or two of the designs show a careful study of the conditions and skilful drawing; others illustrate the theories of acoustical construction, but their architectural qualities have been made a secondary consideration; and a few aim at mere novelty of conception, or are conceived in a spirit of complete variance with architectural rules and canons of composition. There is a reckless attempt to ignore all precedent and produce something sensational or crudely original.

The eleven Soane designs for a concert-hall exhibit various conceptions, from the conventional oblong hall to the ideal acoustical type.

"Ben Marcato," which takes the Medallion

and £100, is a well-drawn set of designs in a kind of Birmingham Town Hall style—a peripteral temple, with pedimented ends, surrounded by thickly-set fluted columns. There is a promenade round area. "Si Je Pais" is an elaborate series of drawings in the Italian Renaissance style, neat in execution, and showing much labour. There is a main order standing on a basement, and the flanks are arcaded between the columns, and form loggias. We do not approve of the broken arched entablature between the columns at the ends. The plan of the hall shows a well-shaped semicircular end near entrance, a curved semicircular recess for orchestra, with corridor round three sides, and having lounges, staircases, cloakrooms, &c., on either side of balcony floor. The entrances and exits are numerous. The total accommodation provided is 2,500 seats. The first balcony floor has a spacious foyer over the entrance hall.

"Olive Green" is conceived in a massive Florentine style, the main angles of front end being pronounced by large engaged octagonal towers, which form retiring-rooms below. Between them above the entrance vestibule on the first-circle level is a large crush-room with front balcony, which is a good feature. The hall is segmental-shaped at this end with three main entrances, also several on each side. The seating area is surrounded by a gangway and corridor. The platform end is recessed, with the side walls slightly inclined, and the seats are arranged as a semicircle within it. Outside the corridor are balconies and staircases. There is an area level, a first-circle and a second-circle level, and a total of 2,514 seats is provided. Some ingenuity is shown in the planning; there are ample entrances and exits, and the construction is fireproof to conform to the L.C.C. regulations. The external elevations are too heavy and fortress-like. Pierced by small openings, these have angle rusticated columns and arches, and the angle octagonal towers are crowned by flat cupolas. The auditorium rises a story above the surrounding building, and is separately roofed with central turret.

"Civitali," a bold Classic design, with large square tower-like projections at corners crowned with cupolas, and having a circular auditorium, is broadly treated, and some good features distinguish the design. The auditorium is covered by an iron domical roof. The author has grasped the conditions of a concert hall, but the design is somewhat crude in detail.

"Lohengrin" fails from its very cleverness. The author has ingeniously sought to develop the harmonic proportions and the acoustic principles of hall design. Accordingly he has made the longitudinal section of his hall trumpet-shaped, the platform or orchestra being narrow and low, expanding by widening walls into the further end of auditorium—no doubt a very clever realisation of the theory propounded by scientific men, but hardly satisfactory as an architectural design. The height, width, and length of hall are in exact harmonic proportion to the numbers 2:3:5. Taking 30.10 as unit, the height of hall equals  $2 \times 30.10 = 61.8$ ; the width,  $3 \times 30.10 = 92.6$ ; the length,  $5 \times 30.10 = 154.2$ ; the width of orchestra is equal to height or 61.8. The external features are of nondescript character.

"Honour" is a florid Italian design, with elaborate foyer and details. There is a large domical foyer and crush-room at the entrance end. "Cecilia" is tame, and has an ill-studied plan. "Swan" is an acoustical plan, but the elevations are wanting in character and dignity. The auditorium is surrounded by corridors with octagon bays at intervals. "Itinerant Architect" sends a bare, roofless, and primitive design, but the seats are well studied.

The designs submitted for a Royal Mausoleum (the Tite Prize) are disappointing. One student, "Red Rose," seems to have the right idea, and has justly been awarded the certificate and £30. The structure is broken, and rises from a Greek cross to a circular dome. There is a simple and dignified treatment, and the drawing of details is clever and masterly. "Memoria," which obtains honourable mention, is severe in outline, a flat-domed octagon, with apsidal chapel in the arm opposite entrance. The dome is panelled and enriched by decoration, and the details are fairly good. "Imperial" is too lofty. It is circular in plan, surrounded by apsidal recesses or alcoves. There is a deep apsidal chapel and projecting entrance.

"Petronius," to which the council gave a second medal, is wanting in solidity and

character; "Rex" is a square outside, octagonal within, covered by a flat dome. The detail drawing of shrine is able. "En Avant" is octagonal, with square-shaped like recesses on each side, forming a Greek cross on plan. Although there is meritorious drawing and detail in many of these designs, the authors have scarcely realised the objects. Eight designs were sent in.

For the Pugin Studentship Silver Medal and £40, sets of drawings have been received from eleven candidates. We notice with commendation H. Raine's very clever drawings in pencil of Chartres Cathedral, La Sainte Chapelle, Paris, firm and accurate in touch; also Benj. Bower's drawings and details of St. Mary Magdalen's church spire, Newark; St. Mary's, Warwick; monastic buildings at Ely, &c.; and J. A. Moore's pencil sketches of details of All Saints', Derby, St. Mary's Church, Warwick, Beauchamp Chapel, &c. There are eleven sets.

The Institute Silver Medal measured drawings are only six in number. It goes to "Wren" (Mr. H. E. Kirby), for a series of accurate drawings of the north porch of St. Paul's Cathedral—a hackneyed subject. Some firm ink drawings are submitted under motto "Nomen" of Moreton Old Hall, Cheshire, gable detail of timber and panelling. "Pitti" is a set of clear ink drawings of St. Michael's Church, Linlithgow, including plans and details. "Non vi sed Sæpe," which takes a second prize, is a clever set of drawings of St. Catherine's College, Cambridge, an interesting example of Classic Revival of the 18th century. Under "Nox" are drawings of Southwold Church, Suffolk, showing the flint panel-work. Riddlesden Hall, Keighley, a good example of Tudor or Early Renaissance, is of interest—motto, "Sulphur."

The Grissell Gold Medal has only been responded to by four. The design is for a fruit, flower, and vegetable market, a good subject, and calling for some knowledge of iron construction. "Simplex" is a clever treatment on the whole, and wins the prize, "Jack" being an indifferent second; while the design "Artichoke," with a central dome, has merit.

The Owen Jones Studentship designs, for the study of colour, are only three in number. The winner, Mr. John Stewart, shows some very effective drawings. Edgar T. A. Wigram sends several clever colour studies from Venice and other Italian cities, and we notice very admirable studies of painted glass from San Marco, Florence, and San Lorenzo, Rome, and also from Venice. The chancel decoration of Santa Maria dei Miracoli, in the latter city, is a fine piece of decoration, very creditably sketched.

#### WHITECHAPEL ART GALLERY.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATION.]

WE publish the elevation and plans of the new picture gallery at Whitechapel which is in course of erection at the cost of Mr. J. Passmore Edwards, who was also the donor of the adjoining building, the Whitechapel Free Library. The site, surrounded as it is by other property, offered difficulties in the way of efficiently lighting the ground-floor gallery. These the architect endeavoured to overcome by an arrangement of plan somewhat on the lines of a church, the "aisles" being entirely top-lighted. Accommodation will be found to hang, with ample spacing, 450 pictures. The ground-floor hall will be so arranged as to allow it to be let for meetings when the loan exhibitions (of which it is intended to hold three or four a year) are not being held. The material for the façade towards the High-street will be a soft-coloured terracotta. The mosaic, which forms the dominant feature of the design, has been designed by Mr. Walter Crane, and is of a size unusual in exterior decorative work, being 25ft. long and 20ft. high. By the omission of the use of gold (the weak point in mosaics exposed to the weather), there is reason to believe in the permanence of the work. The architect is Mr. C. Harrison Townsend, F.R.I.B.A.

#### THE CRITTALL MANUFACTURING COMPANY'S WORKS, BRAINTREE.

WE recently availed ourselves of the opportunity of inspecting the works of the Crittall Manufacturing Company, Limited, at Baintree, Essex, a company which is one of the largest

First Floor Plan

Second Floor Plan

Ground Plan

Basement Plan

WHITECHAPEL ART GALLERY.

manufacturers of iron and steel doors, sashes, and casements in this country. The company have lately considerably extended their premises, owing to the development of their business, and the Manor Works now comprise several large and well-equipped workshops constructed substantially with ample skylights, well ventilated, with provision for overhead travelling cranes, and apparatus for moving the heavy iron and steel plates and manufactures. We first inspected the Door shop, 120ft. by 55ft., where large steel-plate doors to meet the regulations and by-laws of the L.C.C.

and fire assurance offices are turned out. These doors are made double and single-hanging, and in sets; also sliding, with iron hangers, cast-iron wheels, and channel-guide to run in. We here see the large steel plates  $\frac{1}{2}$ in. and more in thickness, framed up into sliding and hinged doors, with stiles and rails from 3in. by  $\frac{1}{2}$ in. up to 9in. by  $\frac{1}{2}$ in., 5ft. to 7ft. wide, by 7ft. to 12ft. high, and angle steel frames, 3in. by 3in. by  $\frac{1}{2}$ in. for party-walls. These are being made for Bovril, Limited, and the workmanship is of the best.

In another part of this shop we saw an 8ft. radial arm drilling machine by Buckton and Co., of Leeds, all holes being carefully drilled in the plates, and all edges planed by a 9ft. plate-edge planing machine.

The Sash shop (No. 3), measuring 160ft. by 40ft., was a very busy scene, scores of hands and machines being at work. Here iron sashes, too well-known to require description, are made. The company mitre all their sash-bar joints, and their sashes claim to be the best machine-mitre jointed in the market. The sections are rolled steel to

special models, and are manufactured of English material; all the corners of frames are brazed together. We notice here a very large skylight for roof of buildings in Red Cross-street intended for the Crittall Co.'s patent glazing, a special tee-section which thoroughly secures the glass, and with condensation grooves. The gutter is of cast iron channel iron. Some huge iron sashes for Messrs. Ogden's tobacco factory, Liverpool, were also shown us, 11ft. 6in. by 6ft. 10in. The frames are made with lugs to fix into masonry, and the ventilators on gunmetal centres, are made to hang in several ways, and to occupy a part or whole width of sash. Many have circular and segment or pointed heads, and all are mitre-jointed. For factories, warehouses, police-cells, and stables, these sashes surpass all others, and their moulded bars and mitres are clean and sharp.

The Casement shop (No. 2) is crowded with work in various stages. Our readers know the high repute the Crittall Company holds in this branch; their casements are too well-known to need description. We see side-hung casements in steel, iron, and gunmetal of all sizes, and with copper weather bars; casements hung at top or bottom, centre-hung casements, casements for fixing to wood or stone, with and without frames.

From these main departments we turn to other shops and stores, in which the several materials are prepared and stored. In the Machine shop we see the operations in perplexing diversity—15 drilling machines, a dozen circular cutting-off machines for plate and bar-cutting to lengths, several saws and lathes and compound milling machines, which latter are ingeniously contrived to mitre the bars where they intersect. No less than 300 tons of sectional bars are stored for use. We may mention that the Engine and Boiler rooms (laid in glazed bricks), occupied by Davey, Paxman and Co.'s engines and boilers, are quite model ones. The electric light throughout the buildings is also generated here. Various and very artistically-designed casement stays and handles in malleable iron, bronzed or blacked, gunmetal, "plain" and "best finished," are made by this company suitable for wood or metal casements, and of superior workmanship. Gearing for casements by vertical and horizontal rods of steel is an important branch of the company's business. Other developments are ship-fittings, radiators, air-tight manhole covers, staircases, &c., all of which goods are of the highest class of workmanship.

#### ESTATE FENCES.\*

VERY few people know anything about boundary fences in their legal aspect, and there are a great many who will be glad to have some authoritative statement as to their construction and cost. Mr. Arthur Vernon, F.S.I., land agent to the late Earl of Beaconsfield, and a member of council and honorary examiner of the Surveyors' Institution, &c., has just brought out a very comprehensive volume on the subject, which will be found of great service to land owners, surveyors, land agents, and others who are desirous of erecting fences. The work is, of course, largely a compilation; but the author's long practical experience as a land agent enables him to speak with authority. Numerous kinds of fences are described in these pages, and they have been divided into four main species—viz., the ditch, the hedge, the paling, and the wall; the author deals with them under the heads of the ditch fence, the hedge fence, the wall, the wood fence, the metal fence, the combination fence, gates, stiles, &c. In so simple a matter, it seems curious to be told that much want of judgment has been evinced in the selection of fences. Hedges of the wrong sort have been planted in soils where they could never have become strong and permanent fences, or have been so mismanaged or neglected as to become a waste of money, an eyesore, and a nuisance. The landscape and economic importance of fencing is acknowledged by everyone who has to manage or lay out land for agricultural and other purposes, and the preservation of bird-life, so essential to the extirpation of destructive insects, is one of the uses of fencing. Many useful observations will be found in Chapter II. It appears that there are many non-

\* Estate Fences: their Choice, Construction, and Cost. By ARTHUR VERNON, F.S.I., &c., and a Chapter on Boundaries and Fences in their Legal Aspect. By T. W. MARSHALL, B.C.L. Oxon. London: E. and F. N. Spon.

destructive birds, like the golden-crested wren, the wood-wren, the chiff-chaff, the yellow wagtail, the titlark, &c.; the hedge-sparrow, unlike his more prolific namesake the house-sparrow, is an insect eating bird, and is useful in getting rid of worthless seeds, and does more good by destroying insects noxious to the farmer than it does harm. Good fences are required round young plantations or ornamental clumps, to exclude sheep and cattle, rabbits, &c. Live hedges, by harbouring insects, vermin, and weeds, and shading, are attended with disadvantages; large hedges at the sides of narrow lanes are picturesque, but exclude the sun and air, and keep the road wet and moist; but if properly kept and trimmed they make pleasing boundaries. The rental value of a farm depends much on the condition of the fences and gates, and the yearly cost of repair. Therefore, when a tenant takes a farm, the fences should be in good condition. A height of 4ft. 6in. is a good height for a fence to a paddock—a 5ft. fence taxes the skill of a hunter. Some useful remarks are made respecting the picturesque in fencing. Straight lines and right angles are abhorrent; curves are more pleasing, and we think the lines of fences should either follow the contour and trend of the ground; but the natural undulation of ground makes even a straight line agreeable. The colour and character of the fences should partake of the landscape and plantations. The sections and illustrations given are numerous, and these show different kinds of ditch fences, like simple ditch, double ditch with bank, a watercourse ditch and bank, &c. The author explains how these ditches are to be dug, the slope necessary for the banks in different soils. Ditch fences depend largely on the nature of the soil—what is right for clay would not do for a ditch in loose earth. "There is no economy in digging a ditch at too steep an angle for stability, and it should never be less than three nor more than five or six times wider at the top than it is at the bottom." Several examples of ditch fences with dimensions are given. The chapter on the management of young hedges is full of useful suggestions, and illustrated by different forms of hedges 4ft. to 5ft. high.

The wall fence is illustrated by several kinds of brick, stone, and flint walls. Very excellent and effective boundary walls are built of brick and flint, rough flint and stone, and good examples are met with at Eastbourne, Folkestone, and other south coast places. Ornamental, perforated, and panelled brick walls are given, and a table of cost of labour and materials is appended. Wood fences are also fully described in their numerous varieties, as the post-and-rail zigzag fences, the Continental palisade fence, matted hurdles, and each kind is illustrated by examples figured. Full dimensions of posts and rails, distance of posts, height, &c., are indicated. Open pale, close oak, boarded, and ornamental wrought fences are illustrated, with data for estimating. Metal fences are also treated in equal fulness, wire fencing, and cast iron and wrought iron, expanded metal, and other fences being described. "Gates and Stiles," "Fences as Shown on Plans," "Ownership Difficulties," and "Fences in their Legal Aspect"—the latter written by Mr. T. W. Marshall, B.C.L., Oxon.—are other chapters to which we cannot refer. The latter chapter adds much to the practical value of this useful and comprehensive treatise. A glossary of terms is given at the end, and the index makes the work easy for reference. The illustrations are numerous.

#### A NEW SURVEYING INSTRUMENT.

THE *Times* describes an instrument which claims to be able to record automatically not only the distance travelled by a bicycle or other vehicle, but also the various directions followed during the journey and the hills ascended or descended. The record of distance travelled, of course, presents no difficulties. The record of directions is not so simple, but it is obtained by means of a compass. The needle is suspended at the top of the pathometer, as the instrument has been named, directly above the tape on which the records are taken, and is so arranged that all its movements are exactly reproduced by the stamping portion of the marking apparatus, though the act of stamping is performed independently of the needle and without disturbing it in the least. The indications appear on the tape in the form of fine arrows, all, of course, standing magnetic north and south. Now the run of the tape represents the direction in which

the bicycle travels; hence the series of arrows constitutes a record of the course steered. The problem of showing ascents and declines is solved by a pendulum. The pathometer is fixed to the frame of the vehicle in such a way that this pendulum is free to move to and fro in the line of travel, its oscillations being damped by immersion in glycerine. Against the recording tape, which is carried on a drum that is rotated as the bicycle moves by the action of a "kicker" as in an ordinary cyclometer, there presses a wheel with sharp teeth, able to cut into the paper. This wheel is controlled from the pendulum in such a way that when the latter is hanging in its middle position—as it does when the road is quite level—the line cut in the tape is straight and parallel to the edges of the strip; but when the pendulum is swung forwards or backwards the line is diagonal, its obliquity being proportional to the steepness of the slope traversed. Hence with a knowledge of the constants of the instrument the gradients over which the vehicle has passed can be easily calculated. The inventor does not expect an error of more than 1 per cent. in the cheaper and smaller forms, while he believes that in the larger ones carefully constructed for scientific purposes it can be reduced to 1 in 1,000. The instrument is not yet on sale.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A BUSINESS and ordinary meeting of the Institute was held on Monday evening, Mr. E. A. Gruning, Vice-President, in the chair.

#### AWARD OF PRIZES AND STUDENTSHIPS.

The Chairman read the deed of award of prizes and studentships for 1898-99 made by the Council, and, the seals of the envelopes having been broken, the names of the prize-winners were also announced in accordance with the following list:—

Institute Silver Medal and Twenty-Five Guineas: for Essay on "The Use and Value of Colour in Architecture"—H. C. Collette, 18, Selwood-place, Onslow-gardens, S.W.; 2nd, £5, F. C. Eden, 3, Staple Inn, W.C.; hon. mention, A. Troyle Griffith, B.A., Malvern; J. Humphreys Jones, B.A., Dalston; and Alexander N. Paterson, M.A., of Glasgow. Seven essays sent in.

Institute Silver Medal and Ten Guineas: for Measured Drawings of Ancient Buildings in the United Kingdom or Abroad—"Wren," H. E. Kirby, St. James's Palace, S.W. (drawings of St. Paul's Cathedral); 2nd, Medal and Five Guineas, "Non vi sed aspe," Heaton Comyn, c.o. R. S. Balfour, 76, Inverness-terrace, W.; 2nd, eq., Medal of Merit and Five Guineas, "Nox," Edward F. Nox, North Bank, Oakley Park, N. Six competitors.

Soane Medallion and £100 (for Continental travel): Design for a Concert Hall—"Ben Marcato," William Arthur Mellon, 136, George-street, Edinburgh. Eleven competitors.

Pugin Studentship: Silver Medal and £40 (for travel in the United Kingdom)—J. Hervey Rutherford, 9, Sydney-street, Chelsea, S.W.; 2nd, Ten Guineas, E. H. Bennett, Curzon House, 35, Albany-street, Regent's Park, N.W.; 3rd, Five Guineas, Ramsay Traquair, 8, Dean Park-crescent, Edinburgh; hon. mention, Albert Herbert, of Leicester. Eleven competitors.

Owen Jones Studentship: Certificate and £100 (for travel and study of colour)—John Stewart, Huntingdon House, Bedford of Allan, N.B. Three competitors.

Godwin Bursary: Silver Medal and £40 (for travel outside the United Kingdom)—E. W. M. Wonnacott, 74, Torbay-road, Brondesbury, N.W. No other competitor.

Tithe Prize: Certificate and £30 (for travel in Italy)—"Red Rose," James B. Fulton, 34, Mecklenburgh-square, W.C.; 2nd, "Petronius," Alexander McInnes Gardner, 3, Albert-street, Downhill, Glasgow. Hon. mention, Ernest T. Jago, 16, Garfield-road, Lavender Hill, S.W. Eight competitors.

Grisell Medal and Ten Guineas (for Design and Construction): Design for a Fruit, Flower, and Vegetable Market—"Simplex," G. Gardner Wallace, 1, Gladmuir-road, Highgate. Hon. mention, "Jack," C. A. Daubney, 1, Wellington-road, Peckham, S.E. Four competitors.

Ashpitel Prize: to most distinguished Student in Final Examinations of 1898—equally divided (Five Guineas each) between Charles Ridley and John Kirkland.

The designs and drawings, which were on view in the meeting room and the council room and the galleries on the floor above, are dealt with in an article on p. 84, ante.

#### ADMINISTRATION OF LOCAL BY-LAWS.

Mr. Lacey W. Ridge moved the following resolutions:—(1) That the administration of Local Building By-laws in rural districts is a matter calling for the action of the Royal Institute. (2) That the Council be requested to communicate with the Local Government Board on the subject, and to appoint a Special Committee to consider and take action thereon. (3) That matters of sanitation, including the preparation of the site for building, should in all cases be carried out under the supervision of the local authorities. That where separate tenements adjoin they should be divided by party walls of incombustible material. That the interests of

ELIZABETHAN BEDSTEAD FROM HEAVITREE HOUSE, EXETER.

the public in buildings in rural districts are not such as to justify any further interference on the part of the public authorities with the construction of buildings.

Mr. William Woodward seconded the motion, which was supported by Mr. J. Douglass Mathews. Mr. P. Gordon Smith assured the members that any representation from the Institute would be received with the greatest respect and attention by the Local Government Board. Mr. Owen Fleming suggested that resolution 3, dealing with questions of detail, might be withdrawn. This was agreed to by Mr. Ridge, and after some further discussion the first and second resolutions were unanimously adopted.

#### ELIZABETHAN BEDSTEAD FROM HEAVITREE HOUSE, EXETER.

THIS interesting piece of historic furniture belonged to the late Sir F. Clare Ford, G.C.B., long Ambassador at Rome. His house at Exeter contained a fine collection of works of art, and among these some really good old furniture. This bedstead was one of the best. During the present week a sale has been held, consequent upon the death of Sir Clare, and Mr. A. Bromley Sanders, of the Cathedral-yard, Exeter, was the auctioneer. The bed has the usual massive turned posts, and a carved and panelled tester deeply coffered in the centre. The head-piece is enriched by figure work. The piece is 5 ft. wide, and as a sample of Jacobean work is of undoubted interest. The carvings are very perfect, and as sharp as when the work was executed.

The memorial to the late Right Hon. Edward Stanhope, at Horncastle, is to be unveiled on February 2 by Earl Stanhope.

#### DRESSING BUILDING STONES BY MACHINERY.

ONE especial feature characterising the work of stone-cutters and stone-dressers is that it is generally carried on in the open air, or in a shed so open to the weather, except for a roof, that it amounts to pretty much the same thing. Another distinction between this and other handicrafts is that, while, as a rule, the latter have benefited largely by the introduction of machinery, new labour-saving appliances and apparatus, and improved methods which greatly facilitate the operations of the craftsmen, the stonemason still plies his tools in very much the same old style as formerly. No one who has watched a gang of stonemasons at work could come to any other conclusion than that the operation of cutting and dressing building-stones is slow, tedious, and laborious. Under the new régime, which has been tried successfully in America, all these drawbacks will be either removed or considerably ameliorated. In the first place, warm and well-ventilated workshops will take the place of the unprotected shed, and in it "dressing machines" will perform at one operation what it at present requires a number of small ones in the aggregate to accomplish. The motive power driving these dressing machines is supplied by compressed air, and the whole process is so exceedingly simple and brief, that one need not be a mechanical engineer to thoroughly comprehend both its full value and efficiency. These machines, or dressers, as they are termed, consist essentially of an ordinary cylinder furnished with a movable piston which works alternately up and down in the interior of it after the regular see-saw manner. At the end of the piston-rod is fixed a cutting-tool, which varies in size, shape, and degree of sharpness, according as the nature of the particular work requires. When the compressed air is admitted

into the piston it acts precisely as steam power does, and, when necessary, can propel the piston and the cutting-tool attached to it at the rate of 120 strokes a minute, although this high velocity is very rarely needed.

It is necessary that the workman manipulating these dressers should be a somewhat experienced hand, and not altogether unused to mechanical appliances, as the cutting-tool demands careful and accurate adjustment for the duty it has to perform. After the cutting-tool, which is balanced by a counterweight, has been properly placed in position, the operator guides it backwards and forwards over the surface of the stone to be dressed until the operation is satisfactorily completed. It is, however, not merely that these machines render the labours of the stonemason much lighter than they have hitherto been which constitutes their principal merit. They possess the greater advantage of contributing to his physical well-being, and very possibly to the prolongation of his health and life. It is well known that there are a number of mechanical trades and businesses in which a considerable quantity of fine dust, and sometimes almost impalpable particles of various disintegrated materials attend the different processes. These minute irritants are continually finding their way into the eyes and lungs of the workpeople, both men and women, and in some instances children as well. There is no difficulty in devising means for, if not totally preventing, at any rate greatly diminishing, the deleterious action of these noxious particles. Numerous are the devices: from the simple mask to far more elaborate designs, which have from time to time been invented, and put into actual use. But the great difficulty to be surmounted, which in some cases appears to be quite insuperable, is to overcome the disinclination of the workpeople themselves to the adoption of these remedial measures. While they acknowledge their value, their utility, and their efficiency, they state that they encumber and embarrass them in the execution of their work. To some extent there is no doubt that in more than one instance this allegation is not devoid of either truth or reason, although not perhaps, to quite the degree the employees would wish to make out. Nevertheless, all English workmen like to work under natural conditions, with their limbs and physical capabilities completely untrammelled and unfettered.

Stone-cutting is one of the handicrafts which is unfortunately accompanied by the production of a large quantity of small petrean particles of a very injurious character. It is claimed as one of the chief advantages of the compressed-air process that it altogether nullifies the evil effect of the dusty residue arising from the continued trituration of the material. Directly the compressed air is liberated, it creates a regular blast which sweeps before it, away from the persons of the workmen, all those injurious annoyances have enumerated. In this particular point compressed air can compete very favourably with electricity as a motive force for a similar purpose. Moreover, the simple dresser is a far less costly and more easily and cheaply manipulated machine than the cumbersome and expensive engine and dynamo, requiring skilled men to attend to them. Both these sources of power are employed in the quarrying of stone, in the piercing of tunnels, and in numerous other descriptions of engineering work. But, at the same time, dealing with rock and stone *en bloc* is a very different matter from the more delicate operation of dressing the surface of stones intended for construction as well as for decorative purposes. The method just described ought to have a future before it, for it possesses three meritorious distinctive characteristics—viz., economy, executive rapidity, and immunity from danger to those engaged in using it.

T. C.

#### BOOKS RECEIVED.

*Monographs on Artists*, by H. KNACKFUS, translated by CAMPBELL DODGSON, M.A. (London: H. Grevel and Co.—4s. each), will be appreciated by all. The issues sent to us (Nos. 1 and 2) deal with Raphael and Holbein. Each volume may be had separately, but readers who value good illustrations and competent criticism will take care to get all as they appear.—*Lockwood's Builders' and Contractors' Price Book*, 1899. Edited by FRANCIS T. W. MILLER, A.R.I.B.A.—The present volume contains, in addition to the price lists of each trade—which remain unaltered, owing partly to the cost of labour, necessitated

by the trade-union policy and the maintenance of high prices by master builders in consequence—the "London Building Act, 1894," edited, with annotations, by Mr. A. J. David, LL.M., of the Inner Temple; Notes on Decisions of the Courts; By-laws and Regulations of the L.C.C., of the Public Health Department of the Corporation of London, "Sections in Electric Lighting," by Mr. A. P. Haslam, A.I.E.E., besides the miscellaneous appendices of tables of weights and measures, areas, solicitor's costs, valuation of leases and estates, legal memoranda, marks and qualities of wood, and the form of building contracts adopted by the R.I.B.A. As a compendious guide to prices and building trade measurement, and as a book of general reference for the contractor, architect, surveyor, and engineer, Lockwood's Price Book maintains its character for completeness and accuracy.—*Description of Various Sewage-Disposal Works*, by R. O. WYNNE ROBERTS, Assoc.M.Inst.C.E., City Engineer, Cape Town (London: The St. Bride Press, Limited, St. Bride's House), is a report prepared by the author, who was formerly borough engineer of Oswestry. The remarks appeared in the *Surveyor*. The author treats the subject under several heads. When dealing with the discharge of Oswestry sewage, he visited several works and reported on them, and this little book gives a summary of the information collected. Under "Land Irrigation with Crude Sewage," the experiences of Wrexham, Nottingham, Merthyr Tydvil, Stretford, and Bedford are dealt with; under "Crude Sewage after Partial Separation of the Sludge," we have data from Merthyr Tydvil, Wimbledon, Cheltenham, Walton, Banbury, Luton, &c.; under "Chemical Clarification and Land Irrigation," the facts are collected from Hereford, Lincoln, Loughborough, Melton Mowbray, Ealing, and Wimbledon. The experience of "Clarification" and "Artificial Filters," "Electrical Treatment," "Biological Treatment," and "Septic Tank Systems" are also noticed; and the author comes to the conclusion that "the biological filters and the septic tank system are both improvements on the majority." Where land is prohibitive in price or cannot be had, these methods of purification can be adopted at less cost; and the author shows that the bacteriological methods have simplified the process, for the filters can be made of any material. Chemical precipitation will, it is thought, only be used in exceptional cases. This little book is a useful summary of the methods in use.

#### CHIPS.

The Board of Trade have recently confirmed an order, authorising the construction of a light railway from Porthywaen, in the county of Salop, to Llangynog, in the county of Montgomery.

Six windows in the Congregational Church, Pendleton, Salford, are about to be filled with stained glass. The artists are Messrs. Beaven, Bennett, and Co., of Manchester.

Tuesday evening, the 31st inst., has been appointed for the Royal Academy elections at Burlington House. There are four vacancies to be filled—three among the Associates and one among the Honorary Foreign Academicians.

At the Manchester Town-hall on Thursday last week an inquiry was opened by Major-General H. D. Crozier and Mr. Theodore Thompson, Local Government Board inspectors, with reference to the application of the city corporation to borrow £160,000 for purposes of sewerage and sewage disposal.

The entrance to the lower chamber in the Central Lobby of the Houses of Parliament is at present occupied with scaffolding, workmen being engaged in placing a mosaic representing St. David in the niche over the doorway. The mosaic is to be a companion work to that depicting St. George, over the entrance to the House of Lords, and it is intended to place mosaics representing the patron Saints of Scotland and Ireland in the corresponding spaces over the doorways leading to St. Stephen's Hall and to the Commons' dining-room and committee-rooms. The David mosaic is being carried out by the Venice Murano Glass Company.

Colonel Luard, R.E., on behalf of the Local Government Board, held an inquiry, in the District Council Offices at St. Anne's, on Friday, for the purpose of obtaining particulars of applications for power to borrow £4,000 for the erection of a fire-station, slaughter-house, mortuary, and town's depot, £3,500 for the erection of a refuse-destructor, £1,583 for a sewer in Clifton Drive South, and £350 for the purchase of a fire-engine: or, in all, just over £9,400.

## Building Intelligence.

BRISTOL.—The new clothing factory erected at Staple Hill for Messrs. Wathen, Gardiner, and Co., was opened last week. The premises cover just an acre of ground, the main building measuring 210ft. by 150ft. The whole of this is lighted from the roof on the north-light principle, using upwards of 13,000ft. of plate-glass set in steel bars. The roof is supported on iron columns, with light steel trusses and framing. The goods can be passed successively through all departments from the receiving-rooms for raw material to the finishing and packing rooms. The machine room, 150ft. by 42ft., has been fitted up by Messrs. Singer and Co. with machines for 400 workers. Power is supplied by a gas-engine, and protection against fire is provided by a system of hydrants. The building is warmed by a hot-water apparatus, supplied by Messrs. Crispin and Sons, who have also put in the stoves for the pressing department. The elevations are of Pennant stone, with Cattybrook brick dressings and cornices, the central block being entirely of brick, with Brosseley tile roof. The general contract has been carried out by Messrs. Cowlin and Son, and the sanitary engineering by Mr. G. Tuckey. The architects were Messrs. La Trobe and Weston, F.F.R.I.B.A., of 20, Clare-street, Bristol.

CRINGLEFORD, NORFOLK.—The parish church was reopened last week after restoration, from plans prepared by Mr. A. J. Lacey, of Upper King-street, Norwich, diocesan surveyor, carried out by Messrs. G. E. Hawes and Sons, of the same city. The total cost of the work has been over £1,400. The south wall of the nave has been removed, and in its place there is an arcade of three arches on four stone columns, and an aisle with gabled roof, capable of seating over 100 people, has been built. The decayed roof of the nave has been replaced by an open-timber one of pitch-pine. The nave and aisle have been seated with oak. Two buttresses have been built into the north wall, and a new heating-chamber has been built, and heating apparatus fitted throughout the church and chancel by Messrs. Reeve, of Duke-street, Norwich. The tower and porch have been restored. While the north wall was being unflaked traces were discovered of two early arches, with a Saxon window, splayed on both sides, and retaining some of its old oak frame. In the south wall were found portions of Saxon crosses and a small Norman capital of Early date. A double recess inside the north wall and a squint on its outside have also been discovered.

LEEDS.—A Presbyterian school hall at the junction of Harehills-avenue and Avenue-hill was opened last week. The hall, which has cost £1,800, is built of pitch-faced stone lined with brick, with a pointed red-tiled roof to conform with the church to be erected in the near future on the immediately adjoining land. The dimensions of the hall are 43ft. by 26ft. 6in., and there is seating accommodation for about 250 people. The roof is timbered, and the walls finished in plaster with a panelled wood dado. Solid wood blocks are used for the floor. Mr. W. H. Beevers, A.R.I.B.A., is the architect, and the contractors include:—Masons' work, Mr. A. W. Hargreaves; joiner, Mr. B. Mawson; wood-block floors and mosaic, Messrs. Geary, Walker, and Co.; ventilation and roof-work, Messrs. Ewart and Son and Messrs. D. Crossley and Son.

MANCHESTER.—In Deansgate a plot of land, having streets on three sides, has recently been purchased partly by the City Missions Board and partly by the Manchester and Salford District Provident Society. The architect for the former and larger building is Mr. Henry Lord, and for the latter Mr. Charles Heathcote. The architects have arranged, as far as rights of light will allow, to erect the two buildings in harmony, and intend using for each building similar granite base, stone ground-floor façade, and with the upper portions in terracotta.

PETERBOROUGH CATHEDRAL.—The work of taking down the south gable of the west front of Peterborough Cathedral has made great progress during the past week. The roofing has been demolished, the surroundings cleared, and the massive and very beautiful foliated cross which tops the gable has been carefully removed, and the demolition process actually started upon. This cruciform finial, with its pedestal, weighs a

couple of tons. It has not been brought into the precincts below, where the rest of the stones are laid in sequence, and repaired, but finds a harbour aloft, as was the case with the northern gable cross. It was a peculiarity of the southern gable roof that its ridge was far below the wheel lights, rendering the window a sham so far as illuminating purposes were concerned. The roof will now be raised. The roof supports were found to be of stout oak, little the worse for age, and although not deemed to be the original, they were at any rate a Mediaeval substitution. So sound are they that they can be added to for the additional height and used again. This gable is not so much out of the perpendicular, nor is it in such a bad plight as its northern sister was. It is leaning towards the Market-place about 1ft. 11in., whereas the other was over 2ft. 2in. out of plumb. Whereas the various orders of the deeply-recessed arch on the northern side had become disordered to such an extent that they were all but slipping over one another, in the case of the southern gable the arch mouldings are secure and will not be touched; the work indeed will only proceed to the main string-course, just below the base of the gable. There are some nasty cracks in the upper masonry, but they are trivial compared with the chasms which were in the north gable. Altogether, therefore, the work is nothing like so heavy as that just completed, and the time occupied will be correspondingly shorter. The work is still being done by Messrs. Thompson's firm, under Mr. G. F. Bodley, A.R.A., the restoration committee's architect, and the residential supervision of Mr. T. J. Irvine, who has been the architect's clerk of the works from the start. Compared with the northern gable, there will be very little renewal of stonework; but sufficient old Barnack rag (of which the front is composed) has been secured for the purpose (in the demolition of "Low Farm"—a homestead contemporary with the date of the west front) and will be worked up. Several of the Alwalton marble shafts, as well as the spokes of the wheel window, have decayed, and will require renewal, wholly or partially; but sufficient material from the Alwalton quarries has been secured for this purpose also. The weather and iron clamps have played havoc with the statuary in this particular gable, and the figures will be pickled in a lime-water bath, and restored where necessary.

RADCLIFFE, LANCOS.—The new Grand Theatre and Opera House, Radcliffe, was opened on Monday week. The building is from designs by Mr. Chas. E. Humphreys, architect, of Chorley. The exterior is of brick, with terracotta dressings. An arcade affords protection against the weather to those awaiting admission. The auditorium is seated for 2,000 people. The ground floor contains two classes of stalls fitted with tip-up chairs, the pit being at the back of these stalls. The first tier contains dress-circle, with tip-up chairs, two large side circles, and four boxes. The gallery is on the floor above. Each part of the house is provided with refreshment and retiring rooms. The stage is 61ft. by 40ft., clear of any obstruction, the proscenium opening being 27ft. wide. There are greenroom, thirteen dressing-rooms, property-room, painting-room, and scene dock, and a fireproof curtain to cut off the stage from the auditorium. Messrs. Baxendale and Sons, of Chorley, are the builders.

RIPON.—The new workhouse infirmary was opened last week. It is two stories in height, and has been erected with local and Leeds bricks, with Pateley Bridge and Killinghall stone dressings. In the central portion, on the ground floor, are the head nurse's sitting-room, medical officer's room, storeroom, assistant nurse's bedroom, waiting lobby, and conveniences. On this floor is a sick-ward, 25ft. 6in. by 23ft., and 11ft. high, for eight beds, with bathroom. The first floor is reached by two stone staircases. The central portion of this floor contains the head nurse's bedroom, bathroom, and lavatories; also labour-room and lying-in-room; while on either side are situated duty-room, special-case ward, sick ward for eight beds, dayroom, and bathroom. Accommodation is provided for 38 patients. The cost of the building has been £2,750, exclusive of furnishing. The architect is Mr. F. H. Hargrave, of Ripon.

SOUTHAMPTON.—The board of guardians adopted, at their last meeting, plans and a scheme prepared by Mr. A. F. Gutteridge, of the firm of Mitchell, Son, and Gutteridge, architects, of Southampton, for building a workhouse infirmary

on the Shirley Warren site, at an estimated cost of £65,000. The buildings now to be erected will comprise lodge and entrance-gates, nurses' home, observation block, doctor's and matron's block, committee-room, &c., kitchen and stores block, receiving and central administrative ditto, two women's pavilions, three men's ditto, small maternity ditto, laundry, boiler-house, mortuary, workshops, sheds, &c. The accommodation will provide 120 beds for sick women, 8 ditto for maternity cases, and 184 beds for sick men. The administrative blocks and offices, laundry, boiler-house, &c., have been arranged and provided to be of sufficient area to allow of future extensions. The nurses' home will accommodate the nurses and probationers only, who will all reside there. The greater part of the bedrooms are about 12ft. by 8ft. for single beds, and there will be a few double-bedded rooms. A general reception-room is provided; also a quiet room, and small visitors' room. This building will be three stories in height, and will provide beds for about 30 persons. All the blocks will be of the simplest character possible, in red brick, with slated roofs. The only buildings with any pretension to architectural effect are the lodge and gates, the nurses' home, and the main administration block, in which a little stonework is used very sparingly.

**WAKEFIELD CATHEDRAL.**—Dr. Tristram, Q.C., Chancellor for the diocese of Wakefield, held an inquiry at Wakefield Cathedral on Friday with reference to a petition from the vicar and churchwardens for a faculty to alter and enlarge the cathedral as a memorial to the late Rev. Dr. W. Walsham How, first Bishop of the diocese. Mr. Chalker appeared in support of the petition, to which there was practically no opposition. Mr. Eldridge appeared for Mr. Henry Hawksworth, the owner of some adjoining property, whose ancient lights will be interfered with, and asked for reasonable compensation. Mr. Chalker promised to negotiate with the property-owners. It was stated that the proposed alterations and additions are estimated to cost from £20,700 to £25,000, towards which £11,000 has already been promised and £9,000 deposited in the bank. The alterations will include new vestries and chapter-house, and will increase the sitting accommodation from 1,400 to 1,800. The plans were prepared by the late Mr. Pearson, R.A., and will be carried out under the direction of his son, Mr. Frank L. Pearson. Mr. Harold Watson, architect, submitted a plan of the graves which will be interfered with. The Chancellor made a decree, subject to the insertion in the faculty of clauses protecting the rights of certain interested parties.

**WINCHESTER.**—The City and County Club in Chenock-place will be opened in March. Messrs. Cancellor and Hill, of that city, are the architects, and their plans have been carried out by Mr. F. Walter, of Southampton, the cost being between £4,000 and £5,000. The bricks used are Rowland Castle red, whilst the ornamental parts are in the moulded brick of Messrs. Poulter, of Reading. On the ground floor is an entrance-hall 17½ft. by 15ft. From it are reached a smoking-room, 29ft. by 24ft.; a dining-room, 29ft. by 21ft.; a manager's room, 13ft. by 11ft.; and butler's pantry, 11ft. by 7ft. The first floor includes a ladies room, 15ft. by 14ft.; a reading-room, 29ft. by 24ft.; and a card-room, 29ft. by 21ft.; also a steward's room, 13ft. by 11ft. The basement contains kitchen, scullery, servants' hall, larder, and cellars.

The old parish church of Bothwell, N.B., was reopened last week after restoration, carried out from plans by Dr. Rowand Anderson, of Edinburgh, and at the same time there was unveiled in the churchyard a monument, executed by Messrs. Doulton and Co., of Joanna Baillie, the poetess.

The improvement committee of the Manchester Corporation have appointed Mr. William Wilson chief building inspector, at a salary of £200 per annum. The committee have also resolved upon a more careful supervision of advertisement hoardings. The height of such hoardings, where they abut upon a footpath, will henceforward be limited to 15ft.

In the case of "Donaldson and the Corporation of South Shields," in the Court of Appeal on Thursday in last week, the practical question between the parties was whether the corporation was entitled to take, in addition to the land actually required for widening a street, land adjoining, and to resell it at a profit. Mr. Justice North had held that the corporation was not so entitled. The Court affirmed the decision of the Court below.

#### LEGAL INTELLIGENCE.

**LORD BATTERSEA AND OTHERS V. THE OWNERS OF CLEMENT'S INN.**—This case came before Mr. Justice Kekewich, in the Chancery Division, on the 13th inst., on a motion by the plaintiffs, the owners of Dane's Inn, Strand, for an *interim* injunction to restrain the defendants until the trial of the action from building a wall on their property at the eastern side of Dane's Inn, in such a manner as to interfere with the access of light to the plaintiffs' property. Mr. Renshaw, Q.C., stated that the owners of Clement's Inn had for some time past been erecting a very high block of buildings on their property overlooking Dane's Inn, and this block of buildings was the subject of the action. Negotiations between the owners of Clement's Inn and Dane's Inn took place in 1887 and 1888, which resulted in an agreement, dated July 30, 1888. Under that agreement it was stipulated that the defendants might pull down certain buildings on their ground which backed upon Dane's Inn, and also that the plaintiffs, the proprietors of Dane's Inn, might increase the height of their buildings, there being certain reservations as to the heights to which the buildings should be carried, and the angles of building, so as to facilitate access of light. The plaintiffs had not increased the height of their building, but his case was that the defendants had exceeded the heights allowed under the agreement, and had interfered with the plaintiffs' ancient lights. One ground of complaint was that the defendants, after allowing the slope-back of their building for a certain height, had then raised it abruptly, instead of the sloping-back being continued. Trouble began early in the autumn, when the plaintiffs' solicitor wrote that the building of the north-western end of the Clement's Inn block greatly interfered with their clients' property, and diminished their light. The writ in the action was issued on Oct. 29. His Lordship: They had liberty to go up to a certain point. If they had gone beyond that point, your claim is not for breach of agreement, but for interference with the access of light without sanction? Mr. Renshaw agreed that that was so. The learned counsel then read the plaintiffs' evidence, amongst which was the affidavit of Mr. Jas. Smith Cooper, an architect and surveyor occupying offices in Dane's Inn, who said that he had been engaged respecting the plaintiffs' property since 1888. The block of buildings on the west side of the courtyard of Dane's Inn, containing ground floor and three floors above, enjoyed uninterrupted access of light over the buildings in Clement's Inn, now pulled down, except so far as the ground floor and first floor were partially obstructed. In his opinion, if the defendant's building was continued, the plaintiffs' light would be obstructed and the value of their premises seriously diminished. His Lordship (to Mr. Renshaw): What are you asking for? Mr. Renshaw: I am only asking on this occasion to keep affairs in *status quo*. Mr. Bramwell Davies, Q.C., counsel for the defendants, then read the defendants' evidence, which had been filed. The affidavit of Mr. Chas. Bull, the contractor, stated that he had known the premises of both plaintiffs and defendants since 1883. Before the new building was put up, the old buildings in Clement's Inn, now pulled down, were higher than those in Dane's Inn. The agreement of 1888 did not refer to roofs or chimneys, and, as he understood, fixed the height of the wall, but not of the roof. In his opinion, the plaintiffs at no time prior to the pulling down of the old building had uninterrupted access of light, but a lesser angle than they now obtained. He denied that they would be deprived of light previously enjoyed. Mr. Slade, the defendants' architect, stated that when making the designs he had most carefully considered the height and position of surrounding property. He denied that there was any material diminution of light to the plaintiffs' windows as they now existed. The agreement of 1888 did not provide for slopes of roofs. Other affidavits were read to a similar effect. His Lordship: My view of this agreement is that it gives the defendants liberty to remove their old building and to erect a new building, as shown under the conditions agreed. Nothing more nor less. Mr. Davies, for the defendants, agreed that as far as anything else was concerned the parties were governed by their ordinary rights, whatever they were, but was there not, however, a deduction to be drawn from the agreement? The owners of Dane's Inn obtained power to increase the height of their building under this agreement. He (counsel) submitted that he was entitled to say that it must be considered in deciding on what the defendants had done that if Dane's Inn was carried up as the plaintiff had power to do there would be no question of the Clement's Inn building obstructing the lights as now complained of. His Lordship: You want to treat an option as an obligation? The learned counsel replied that he wanted to treat as done that which the plaintiffs had power to do, and that he submitted was the intention of the parties. In conclusion, the learned counsel submitted that, in view of the distance at which the Clement's Inn and Dane's Inn buildings stood apart, there was not sufficient evi-

dence to show that there was material interference with the light, or that there would be such interference when the building was completed. His Lordship, in giving judgment, said that the ingenuity of surveyors, and, perhaps, that of their legal advisers as well, had been largely expended in confusing a perfectly plain issue. That issue was this: Had the defendants by such part of their building as went beyond the lines sanctioned by the agreement interfered, or would they interfere when their building was completed, substantially with the access of light to the plaintiffs' building? The defendants had introduced what was practically an idle contention: that something else might or would happen if the plaintiffs hereafter exercised the option given to them by the agreement to raise their building. The plaintiffs had not exercised that option, and there was not a word in this case to show that the relative rights of the parties were changed by that option. The construction of the agreement was plain. It provided for a new building under certain conditions, but there was no prohibition one way or the other. It was perfectly plain that the defendants were to be at liberty to build as provided by the agreement, without justifying any complaint on the part of the present plaintiffs, and leaving them free as to their actions subject to any interference with the Law if they chose to overstep it. The question was whether the wall in question would affect the light of Dane's Inn when the defendants' building was completed. Here was a new building of enormous height in the place of a dwarf building, and it was quite impossible, to his mind, to say that that enormous building would not interfere with the access of light to houses on the other side of Dane's Inn. Therefore he thought that the injunction must necessarily go to restrain, not a breach of the agreement, because he did not think that the agreement had been broken, but an interference with the light under the ordinary law. Mr. Renshaw suggested that the form of the injunction had better be to restrain the defendants from building or erecting any building or erection so as to darken or obstruct the light of windows of Nos. 2, 3, 4, and 5, Dane's Inn, which such windows enjoyed prior to the pulling down of the tenement in Clement's Inn, upon which the present building was being erected, except so far as the defendants were authorised to build to the height and angles shown in the plans under the agreement of 1888. His Lordship agreed to this.

**BRISTOL BUILDING BY-LAWS.**—**YABRICOM V. KING.**—In the Queen's Bench Division, on the 13th November, before Mr. Justice Day and Mr. Justice Lawrence, sitting as a divisional court, a special case stated by two justices of Bristol for the opinion of the court came on for hearing. Mr. Salter, in opening the case on behalf of the Bristol Corporation, said there was an information by the city surveyor of Bristol for an alleged infringement of the Bristol Improvement Act on the part of the respondent by erecting certain houses without parapet walls as required by the Act. The houses were at Bell Hill, in the parish of St. George, which until recently was part of the urban district of St. George, in the county of Gloucester, and which was outside the limits of Bristol. The parish was included in the city of Bristol by an Act which came into force on the 31st October, 1897. By that Act the Bristol by-laws applied to the added area, but there was a promise that all plans of new buildings within the added area, and which had been approved by the urban district council or local authorities before the commencement of the Act, should remain valid for a period of two years from the date of the commencement of the Act, and on the expiration of that period fresh plans would be required. In this particular case the respondent had deposited with the urban district council of St. George, before the date of inclusion of the area in Bristol, plans of a terrace of houses. Those plans neither complied with the by-laws of the urban district of St. George, nor with the by-laws of Bristol. Nevertheless, the plans were approved by the urban district council, who waived compliance, and endorsed the plans as approved. After the inclusion of the area in the city and county of Bristol, a particular house of the terrace was in course of construction in accordance with the plans which had been approved. Now, by both the by-laws of St. George and of Bristol, the party-walls were required to be carried up so as to form parapets, the object being to prevent fires spreading from house to house. In the case of the Bristol by-laws the principal walls were to be carried higher than under the St. George by-laws. The St. George Council, however, had passed plans for houses without these parapet walls in contravention of their own by-laws, and it was when the Bristol authority saw that in the particular house now in question no parapet walls were to be erected, they took their present action. The respondent's answer was that he had not committed any offence, because he relied on the proviso of the Bristol Act that plans approved by the St. George authority were to remain valid for a period of two years, and that they were approved within the meaning of the Act. The contention of the Bristol Corporation was that

there was no approved plan within the meaning of the Act, because on the authority of a decided case the local authority had no power to waive compliance with the by-laws, which were for the benefit of the public, and that, therefore, such approval was *ultra vires* and a nullity, and there was no approved plan within the meaning of the Act. Mr. Eldon Bankes, for the respondent, said the plans had been deliberately approved by the existing local authority and had been acted upon. The St. George authority, after having passed the plans, could not have interfered with the respondent in building according to those plans; and if the contention were correct, then it was not open to the Bristol authority, who were in the same position as the St. George authority, by the provision as to two years, to interfere with the respondent in completing the houses according to the approved plan. Mr. Justice Day, in giving judgment, said the urban district council of St. George had no power to control the law. The by-laws had the effect of law, and it was not competent for any public or private body to dispense with the law. A public authority was bound by the law like everybody else, and the Bristol authority were right in seeking to ascertain whether the St. George Council had exercised their powers properly. He was of opinion that the magistrates had come to a wrong conclusion in dismissing the information. Mr. Justice Lawrence concurred. The appeal was allowed with costs, and the justices were directed to convict.

**WOOD BLOCK FLOORING.**—WARD AND CO. V. "WESTERN MAIL" (LIMITED).—The plaintiffs in this case, heard by Mr. Justice Wright on Saturday, who are specialists in granite concrete paving and wood-block flooring and carry on their business at 15, Great George-street, Westminster, claimed £113 for work done and materials supplied at the defendants' premises in Cardiff. The defendants are proprietors of the *Western Mail*. At the end of 1896 the plaintiffs laid down some granite concrete paving and wood-block flooring for the defendants under a contract in writing whereby they undertook to do the work in a good and workmanlike manner to the satisfaction of the defendants. The defendants declared they were not satisfied with the work, as cracks and holes had appeared in the paving and many of the blocks in the flooring had come loose, and refused to pay. The plaintiffs alleged that any defects that might have appeared were due to special circumstances in the premises and not to bad workmanship, and denied that the defendants had any reasonable grounds for rescinding the contract. Mr. Justice Wright gave judgment for the defendants, with costs. In any ordinary case defects in work would only entitle the defendant to some reduction in the amount to be paid. But in this case the contract was of a peculiar nature, and the plaintiff must have known what was implied in the words "to the satisfaction of the defendants." The defendants had acted reasonably in rejecting the flooring and paving altogether.

**WORKMEN'S COMPENSATION ACT AND BUILDINGS UNDER 30FT. IN HEIGHT.**—MELLOR V. TOMKINSON AND CO.—In the Court of Appeal on Friday, Lords Justices A. L. Smith, Chitty, and Collins heard this appeal from an award of the Judge of the Liverpool County-court in an arbitration under the Workmen's Compensation Act, 1897. The claim was made by Thomas Mellor, a workman, to recover compensation from Messrs. James Tomkinson and Co., his employers, for accidental injuries suffered by him in the course of his employment, by reason of a piece of brick having gone into his eye, in consequence of which it became necessary to have the eye removed. At the time of the accident the claimant was engaged in building the wall of a house in the Vauxhall-road. The wall was not then 30ft. in height. The claimant was on a scaffold just above the basement. Beams were being raised for the purpose of making a flooring. There was a pole run up about 20ft., and guy ropes from the pole, and fastened to the top of the pole there was an iron wheel with a groove in it. An iron chain went over the top of the wheel. The guy ropes steadied the pole, and the pole also ran into the ground. One side of the chain was to hook the beam on, and the other side to pull the beam in. Six or seven men were at the beam and chain together—two to guide the beam, the rest at the chain. There was a brake on the wheel, which stopped the beam from running back. It was admitted at the trial on the part of the employers that a machine was being used which was driven by mechanical power. The County-court Judge thought the case came within section 7, and made an award in favour of the claimant. The employers appealed, and it was argued on their behalf that the employment in question was not on, in, or about any engineering work, or any building which exceeded 30ft. in height. The Court, without calling on counsel for the respondent, dismissed the appeal. Lord Justice A. L. Smith said the first point taken was that this was not a building on which machinery driven by mechanical power was being used. It had however, been admitted at the trial, on behalf of the employers, that this was a machine driven by

mechanical power. This point, therefore, was no longer open. It was then said that, as the wall was not 30ft. high, the case did not come within section 7. But he thought that the words "which exceeds 30ft. in height" were only coupled with the words "and is being constructed or repaired by means of a scaffolding, or being demolished"; and that the antecedent to the following words "or on which machinery driven by steam, water, or other mechanical power is being used" was the word "building" simply, and not the words "building which exceeds 30ft. in height." Therefore, if the building was one on which machinery driven by mechanical power was being used, it was not necessary, in order to bring the case within the Act, that it should also be 30ft. high. Lords Justices Chitty and Collins concurred.

**THE WHITEHALL IMPROVEMENTS.**—At the Surveyors' Institution on Thursday in last week, Mr. Robert Vigers, the president, sitting as arbitrator, heard a claim brought by Messrs. Meynell and Pemberton, solicitors, against her Majesty's Office of Works for compensation and disturbance to their leasehold premises, 20, Whitehall-place, acquired by the Crown under the Whitehall Sites Act, 1896. Mr. P. L. Pemberton, sole partner in the firm, said that their average profits during the last three years had been £7,000 per annum, and he considered two years' profits as a fair basis of compensation. Mr. G. H. B. Glasier (of 7, St. James's-street), Mr. Daniel Watney, Mr. E. H. Tewson, and Mr. H. C. Trollope, surveyors, gave evidence on behalf of the claimants. On behalf of the Board of Works, evidence was given by Mr. James Green (of Messrs. Weatherall and Green), Mr. W. E. Horne (of Messrs. Horne and Co.), Mr. W. H. Elwell, Sir John Taylor, and Mr. J. H. Sherwin (of 16, Whitehall-place). The Attorney-General, for the Crown, agreed that the claimants should receive a substantial sum, say £1,000 or £1,500, as an insurance premium; but to give any such amount as that claimed by Mr. Pemberton was, he urged, a proposal the facts of the case could not justify. The arbitrator reserved his award.

**TOWER BRIDGE APPROACH ARBITRATION.**—Justices Day and Lawrence on Saturday had before them a case in which the County Council sought to set aside an award. The Council, under a private Act, acquired certain property belonging to a Mr. West for the purpose of carrying out improvements to the northern approach of the Tower Bridge. A jury awarded the owner £11,026 as compensation, and it was now contended for the Council that the proceedings should be declared void owing to an alleged excess of jurisdiction on the part of the Under Sheriff. The Court held that, taking the directions of the Under Sheriff as a whole, there was excess of jurisdiction, and discharged the rule for a writ of certiorari, with costs.

**STRAND AND TOTTENHAM COURT-ROAD IMPROVEMENTS.**—Mr. James Green (Weatherall and Green), of Chancery-lane, the valuer appointed by the Local Government Board, has now made his initial valuations for the purpose of "betterment" in regard to these two improvements. His awards have been deposited with the London County Council, and are open for inspection as provided by the London County Council Improvements Act, 1897.

**ARBITRATION BETWEEN ARCHITECT AND BUILDERS.**—SPRAGUE V. ALLEN AND SONS.—Mr. Justice Bruce and Mr. Justice Ridley heard, on Wednesday, in the Queen's Bench Division, a motion to remit an award which had been made by Mr. Justice Bucknill, sitting as arbitrator before his elevation to the Bench. Mr. McCall, Q.C., for the applicants, stated that the plaintiff, Mr. W. G. B. Sprague, was an architect engaged by the defendants in building the Deptford Theatre. An action was brought by him for his commission; to this no defence was raised, as it was believed that the claim put forward was for the right amount; there was, however, a substantial counterclaim for some £17,000 for breach of warranty. The action was referred by consent in July last by Mr. Justice Hawkins to Mr. Justice Bucknill, then Mr. Bucknill, Q.C. His award found in favour of the plaintiff on the claim and counter-claim, but without costs, and directed judgment to be entered in accordance therewith. Since this the defendants had discovered that the plaintiff had based his commission on a sum which was inaccurate. The result of this was that £91 in excess of what was proper had been charged for commission. The defendants had paid this sum on threat of execution being levied if they did not pay. This excess was not disputed in the affidavits on the motion. Mr. McCall cited the case of "*In re Keighley, Maxsted, and Co. v. Bryan and Co.*" (1893), to show that the Court had powers, even after judgment, to remit an award on the ground of the discovery of new evidence since the making of the award. Whether the £91 was accidentally charged or fraudulently in the first instance, the architect now knew that the £91 was not due, and he ought not to resist the application. Mr. Horace Ivory, following on the same side, contended that, not only had the Court power to set aside the judgment, but also to enter judgment

for the right amount. He cited for this the case of "*Clark v. Sonnenschein*." Under order XL, rule 2, a referee was bound to enter judgment; it was not a mere discretion. Mr. Rose Innes, for the plaintiff, said the plaintiff's claim was, as was well known by the defendants, based upon an estimate only of the total expense. Probably the claim was not disputed, as the gigantic counter-claim occupied the minds of the defendants. This was a reference by order of Court by consent, not a compulsory reference. He cited "*Darlington Wagon Co. v. Harding*" to show that the award should not be interfered with. It was perfectly possible that as the builders had still some claims, the commission claimed might prove to be right. The defendants themselves could have found out what the right amount was. The Court remitted the matter to the arbitrator. Mr. Justice Bruce said the Court was asked to remit the award in order that the arbitrator might reduce the sum to be paid by the defendants. The claim and the counter-claim had been referred; the arbitrator had disallowed the counter-claim; the claim, therefore, alone remained. The defendants did not on their pleading deny the plaintiff's claim. He made up his 5 per cent. commission in respect of the various matters on a total sum of about £35,300. The defendants, knowing that 5 per cent. was due on the amount of the contract, and thinking that the commission was based on the true amounts, did not dispute it. It now turned out that that amount was really £91 less. Under the circumstances, were they entitled to have the award remitted? There was no doubt that the Court had power to remit an award on the discovery of fresh evidence. The older case of "*Burnard v. Wainwright*," as well as that of "*Keighley, Maxsted, and Co. v. Bryan and Co.*," showed that. He quite agreed that this power should not be exercised without due care. Yet the Court ought not to allow injustice to take place. In this case, evidence which would certainly have affected the mind of the arbitrator had been discovered. He thought, therefore, that the matter ought to be remitted. It was, perhaps, within the power of the Court to direct judgment at once, but the Court would only exercise any such power with extreme caution. The award would, therefore, be remitted. Mr. Justice Ridley concurred.

**THE POWERS OF SANITARY INSPECTORS.**—VINES V. NORTH LONDON COLLEGIATE, & CO., SCHOOL.—In this appeal, heard in Queen's Bench Division on Wednesday by Mr. Justice Lawrence and Mr. Justice Channell, the appellant Vines was a lady inspector for the parish of St. Pancras, and the respondents carry on a large girls' school in the North of London. The case raised a question under the Public Health (London) Act, 1891, as to the powers in sections 10 and 40 given to the sanitary authority to enter upon premises within their district and examine them, in order to see whether or not they are in a sanitary condition. The inspector applied to the school to be admitted, and was refused, and then she applied to Mr. Plowden, the police magistrate, for an order to enter, but in her information did not state that she had reason to believe that there was anything wrong with the sanitary arrangements of the school. The magistrate refused the application, holding that no reasonable ground had been shown for entering. The appellant therefore instituted the present appeal. The Court dismissed the appeal, with costs.

An inquiry was held at the Council House, Birmingham, on Friday, by Mr. H. P. Boulnois, one of the inspectors of the Local Government Board, into an application made to the Board by the city council for sanction to borrow £10,000 for the provision of a branch school of art to be erected at the corner of Moseley-road and Lime-grove. Mr. W. H. Bidlake, the architect, explained the plans, and said the builders' tender was £6,502, without furniture and fittings.

At the Bolton County-court, on Friday, Judge Jones gave a verdict for £120 to a bricklayer's labourer named Michael Kenny as damages for the loss of a finger. Kenny was working at the erection of the new fire-station for Mr. Cunliffe, contractor, when a girder fell and cut off his finger.

During the gale on Friday night a gust of wind blew down a lofty platform at the works now in progress at the Mount Pleasant Post-office, carrying with it two large derricks. The platform was some 70ft. in height, and supported a steam-engine and boiler, which fell, together with the derricks, upon the buildings now being erected below. One of the derricks was blown down during the recent gale a couple of weeks ago, and the damage then incurred is said to have cost the contractors (Messrs. W. H. Lorden and Son, of Upper Tooting) £1,000. On this occasion the loss will be very much heavier.

The new schools, Sandwich, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators, and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

## THE WHITECHAPEL ART GALLERY.

We give this week an elevation of the façade and plans of both floors of the Art Gallery which is being erected for Whitechapel at the cost of Mr. J. Passmore Edwards, and of which Mr. C. Harrison Townsend is the architect. A further description appears on p. 84.

"BUILDING NEWS" DESIGNING CLUB: A VILLAGE SHOP AND POST-OFFICE, WITH COTTAGES.

(For description and awards, see p. 83.)

## LEDCAMEROCH.

LEDCAMEROCH is a house built about 30 years ago, of which Mr. George Walton, of 152, Wellington-street, Glasgow, had lately the alteration and decoration of interior. The hall fireplace did not exist in the old plan, and has been built in entirely new to Mr. Walton's design. It consists of tiled hearth and back, with hammered sheet-iron armour bright finish. The grate is a movable chair grate in wrought iron. The chimney-piece is built in Hopton Wood stone, with timber facings. The frieze above chimney-piece is plaster sanded ground, coloured yellow, with stencilled decoration in browns and yellows. The cornice is the original cornice. The staircase hall is balustered with upright posts and wrought-iron handrail. The window of the staircase is principally in white, and is rather heraldic in character, with a few touches of colour through it; it is entirely in mosaic, and no painting. The entrance hall and doorway are in oak, with mosaic leaded glass panels, with hammered copper bands inserted. The drawing-room is an alteration, two rooms being made into one. On the left of fireplace is a French casement leading to lawn. The door on fireplace elevation leads to dining-room; the ceiling is strap-moulded and painted white, the frieze is covered with a silk and linen tapestry, the background is linen and the ornament in silk, the colour naturalistic on white ground, and has been woven to Mr. Walton's design, under his directions. The under walls are panelled to about 6ft. 6in. in timber, and enamelled white. The glass-work in doors and windows is similar to that in hall. The fireirons, fender, and grate are in polished steel, tiles of rich deep blue, and floor of oak. All the work is made and executed at the works of Messrs. Geo. Walton and Co.

## NEWELS FROM BRUSSELS.

Among the recent additions to the South Kensington Museum are a fine collection of 17th and 18th century oak newels, which come from different houses now demolished in Brussels. The whole batch, comprising over a dozen, are boldly carved

with flowers, foliage, and grotesque heads. We give sketches of four so carved in oak, and finished at top of base in a spiral manner. Further sketches will be given in due course. The designs of these newel posts are somewhat uncommon, and they are peculiarly decorative. In Brussels the Museum possesses quite a fine collection of them, and so this particular kind of newel must at one time have been employed in many houses in that city. From the information which has reached us from a distinguished authority, we understand that it will be very difficult not long hence to obtain examples of this kind of post. These new acquisitions in the Museum are due to the energy of the Director and his staff.

## CHIPS.

The spire of St. Paul's Cathedral, Calcutta, which was so seriously damaged during the earthquake, has now been completely repaired. The other damages which the edifice has sustained have also been made good. The architect is Mr. Edward Thornton, A.R.I.B.A., who has also designed the new Episcopal throne, which will be executed in marble and oak by Messrs. Martin and Co., of Calcutta.

A stained-glass window, to the memory of the late Mrs. Dalziel, of Tigh-na-Traigh, has just been placed in Aberfoyle parish church. It consists of three compartments, which are filled with figures illustrating the Nativity. Messrs. A. Ballantine and Gardiner, of Edinburgh, are the artists.

The Colne Town Council have resolved that the report of the architect on the cost of the new technical schools, public library, and central hall be adopted, such scheme not to exceed £9,000, and that the architect be paid £200 for work done up to the present time in full settlement of claim.

Mr. P. Reynolds, M.Inst.C.E. (late superintending engineer, Northern Division, P.W.D., Bombay), has been appointed engineer to the board on a salary of Rs.1,800. The engagement is to be for three years. Mr. Reynolds will give his whole time to the service of the board.

New branch printing premises at Perth, for the British Linen Company, have just been opened. They occupy the site of the Free St. Stephen's manse, at the corner of Caledonian-row and York-place, and have been erected from plans by Messrs. Peddie and Washington Browne, of Edinburgh.

The Wolverhampton Board of Guardians have finally approved of and adopted the plans for the new workhouse prepared by Mr. Marshall, of Nottingham, whose design was recently selected in competition. They have also decided to employ Mr. Marshall to take out the quantities for the work in the erection of the workhouse, at a fee of 1 per cent. on the outlay, such outlay not to exceed 5 per cent. of the estimated cost of the buildings.

The Llandudno Urban District Council have adopted a scheme proposed by Mr. Wyatt, C.E., for the construction of a reservoir at a point below the turbine in the Vivod Valley, with pipe line, service-tank, &c., estimated to cost in its entirety £4,785.

The umpire in the arbitration between the Long-ton Corporation and Mr. Thomas Pedley in respect of the price to be paid for property in Stafford-street and Edensor-road, required for public street improvements, has fixed the amount to be paid by the corporation at £2,516.

It is proposed to raise a fund for the restoration of St. David's Cathedral, the noblest monument of ecclesiastical architecture in Wales. The present structure was commenced by Peter de Leia about the year 1180. During the time of Bishop Thirlwall, and subsequently under the direction of the late Sir Gilbert Scott and his son, Mr. J. Oldrid Scott, who is to be intrusted with the completion of the work, very extensive restorations were carried out, at a cost of over £43,000; but these did not extend to the eastern group of buildings, which are now in a ruinous condition. The restoration of the beautiful eastern buildings, which will cost, it is estimated, not less than £12,000, is intended as a memorial to the late Dr. Basil Jones and Deans Allen and Phillips.

The town council of Aberdeen have decided that the Fish Market be extended along Market-street, in accordance with the amended plans of Mr. R. G. Wilson, architect. The length will be 426ft., and the width 36ft., and the cost, exclusive of foundations, is estimated at from £4,000 to £5,000. The building will be retired 10ft. from the east edge of the wharf, while the width of the street alongside the market (inclusive of the foot pavement) will be 96ft. At the same meeting a motion to bear the cost of restoring Greyfriars Church, in accordance with plans prepared by Mr. A. Marshall Mackenzie, A.R.S.A., of that city, was rejected after a lively discussion.

## COMPETITIONS.

ABERAVON.—In the recent competition for new market at Aberavon, South Wales, twenty-two sets of designs were sent in. The ones selected being those of Mr. Frank S. Biram, of St. Helen's, who has been appointed to carry out the work.

BRISTOL.—The corporation libraries committee have decided to invite local architects to submit designs for the erection of a new library on the Cheltenham-road site, and the designs have to be sent in on or before the 1st of March. The probable cost of the building will be about £7,000, including the furniture and fittings. The building will be one of the largest branch libraries in the kingdom.

CHIPPENHAM.—A competition is proposed to be held for designs for an isolation hospital. The committee have resolved that a stone building be erected, comprising two male and two female wards, five beds in each, with bedrooms for three nurses upstairs, and one bedroom downstairs; also kitchen, sitting-room, and accommodation for caretaker. It was decided to invite architects in the district to send in plans of a building with the accommodation named, and at an estimated cost not to exceed £600. According to the Local Government Board requirements for infectious cases, the bare air-space demanded for sixteen patients would be, at 2,000 cubic feet per head, 32,000 cubic feet. This, at 6d., works out at £800. Furthermore, a correspondent writes: "The site being away from public sewers and water supply, sewage treatment and water supply are to be included in the scheme."

HULL.—The competition for the new Public Library at Hull is not yet determined, as the award of the referee, Mr. Sidney Smith, has not yet been confirmed by the committee. There were fifty-one designs sent in.

SESSIONS HOUSE, OLD BAILEY.—The City Lands' Committee of the Corporation are arranging for the rebuilding of the Sessions House in the Old Bailey. They have consulted Professor G. Aitchison, R.A., the President of the Royal Institute of British Architects, who has suggested a competition among a limited number of architects, to be nominated by the Council of the Institute. The committee, adopting this suggestion, have approved of six architects being nominated by the Council, on the understanding that the acceptance of any of the designs submitted should not be binding upon the Corporation. In the preparation of the necessary conditions of the competition and the ultimate selection of a design, they have appointed Professor Aitchison as assessor, with the co-adjutorship of the city surveyor, Mr. Andrew Murray. Each unsuccessful candidate submitting a complete set of drawings, with estimates, will receive an honorarium of 200 guineas.

We are glad to hear that Mr. Elgar Farman, the solicitor to the Society of Architects, is able to attend to business again, though still suffering from the effects of his recent serious accident, and unable to move much without assistance.

A new station will be opened by the Great Western Railway Company in the spring between Slough and Taplow, and will be designated "Burnham Beeches."

The memorial to Lord Tennyson in Haslemere Church is to take the form of a window, after a design by the late Sir Edward Burne-Jones (one of the last of a series illustrating the story of the Holy Grail), representing the vision which came to Sir Galahad in the little chapel. The window will cost about £100.

The tower of St. Sidwell's Church, Exeter, has been stripped of its plaster case. Like the church itself, save the chancel, which is comparatively modern, the tower is of Heavitree stone. When repairs were needed red brick was used, and the cobbling of the "restorer" was concealed by plaster casing. The tower will be cased with stone, so as to harmonise with the rest of the building, and there is a proposal to remove the copper-covered spire added in 1820, and which is a conspicuous feature in views of the city from the surrounding hills. Mr. E. Hall Harbottle, of Exeter, is the architect for the restoration.

A Local Government Board inquiry with reference to the application of the Uttoxeter Urban District Council to borrow £1,762 to complete the purchase of the Somershall Herbert Springs for supplying the town of Uttoxeter with water, was held at the town-hall on Friday. Lieutenant-Colonel Albert Smith, R.E., attended as an inspector from the Local Government Board.

### PROFESSIONAL AND TRADE SOCIETIES.

**BRISTOL MASTER BUILDERS' ASSOCIATION.**—The annual report presented to the members at the meeting held on Wednesday states that the work performed during the past year had been alone sufficient to justify the existence of the association. During the past year there had been increased prosperity in the building trade of Bristol, though it must be admitted that there had been greater competition; but where there was competition the trade must be healthy. Reference was made to the demand made by the men in March for an advance of wages and sundry alterations in the working rules, and to the arbitration proceedings which followed. The effects of the Workmen's Compensation Act upon the trades also passed in review. In opposing the Plumbers' Registration Bill, the committee was of opinion it had acted in the interests of the public and the building trades generally, and it was intended to persevere in its efforts in that direction. The West of England and South Wales Federation, established in the previous year, was gradually gaining ground in popularity. The next ordinary half-yearly meeting would be held in Cardiff next May, under the presidency of Mr. W. Symond, of that town.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—At the last meeting of this association, held in the Royal Institution, Edinburgh, Mr. Thomas Ross, the president, in the chair, a lecture on "Explorations in Palestine and Jerusalem" was delivered by Mr. A. C. Dickie, A.R.I.B.A., of the Dundee Institute of Architecture. The paper dealt with the recent excavation at Jerusalem carried out by the Palestine Exploration Fund, under the direction of Dr. Bliss and Mr. Dickie. Their principal work was the recovery of the southern limits of ancient Jerusalem, and the recent explorations showed, he said, that the city once extended very much further south than the present southern boundary, the addition to the area of the city amounting to over 100 acres. Almost the whole of this area is now cultivated in tiny terraces and plots, the soil having accumulated over the ancient ruins to an average depth of from 25ft. to 30ft., and in some places as much as 70ft. The ancient wall incloses the whole of the western hill down to the verge of the Kedron Valley across the Tyropeon, under the Pool of Siloam, on to Ophel, where it joins the wall traced by Sir Charles Warren from the south-east angle of the Temple area. Towers occur at short intervals along the wall, and three gates (two of which show three periods) were found between the Protestant cemetery and the Pool of Siloam. The discoveries illustrated in a remarkable manner the description given in the second and third chapters of Nehemiah of his night ride and survey of the ruined walls and subsequent apportionment of sections of the work of restoration to the different Jewish families from the "Valley Gate" to the "stairs that go down from the City of David" (Nehemiah iii. 13-15). The lecturer also referred to the discovery of a church, baths, mosaics, and tombs, and concluded with a few notes on the mode of excavation and the difficulties to be encountered. The lecture was illustrated by drawings and lantern slides.

**HEREFORD AND DISTRICT MASTER BUILDERS' ASSOCIATION.**—The second annual dinner in connection with this association took place at the Mitre Hotel, Hereford, on Tuesday week. Mr. W. P. Lewis, president, occupied the chair, Councillor James Davies the vice-chair, and there was a large attendance. Mr. J. Stephenson Jones, Birmingham, president of the National Association of Master Builders of Great Britain and Ireland, wrote, among others, regretting his inability to attend. Mr. John Davies, in proposing "The Mayor and Corporation of Hereford," suggested that the Artisans' Dwellings Act should be put into operation in the city. The Mayor (Councillor James) replied. Mr. Symonds (Cardiff) said that, in reference to the relations between architects and builders, their relations in the past had not been altogether satisfactory; but in most cases now, he was glad to say, architects were guaranteeing their quantities. Mr. A. Krauss (Bristol) drew particular attention to the scarcity of plasterers. These men kept raising their terms, and the matter would have to be dealt with promptly. Among the other speakers were Mr. A. J. Corner, Mr. E. H. Lingen Barker, Mr. H. Easton, Mr. W. Bowers, Mr. J. Mitchell, Mr. L. Hodges, and Mr. L. D. Lewis.

**ST. PAUL'S ECCLESIOLOGICAL SOCIETY.**—The

twentieth annual report, to be read at the meeting to be held to-morrow (Saturday) afternoon, states that seven meetings have been held at the Chapter House, at which papers were read by Mr. Joseph Grimshire, the Rev. E. S. Dewick, Mr. Mill Stephenson, Mr. Edward Bell, and Mr. H. B. Briggs. During the summer afternoon visits were made to the several parish churches of Perivale, Greenford, Northolt, St. Margaret, Lothbury; Holy Trinity, Roehampton; and Horsham.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—The monthly meeting of this society was held at the School of Art on the 11th inst. Mr. Frank Baggallay, F.R.I.B.A., of London, delivered a lecture on "Some Common Errors in Architectural Design." The lecturer referred to the undue value often placed on ornament as a source of architectural beauty. The common use of large quantities of badly designed and injudiciously distributed ornament was condemned, and some of the commoner errors pointed out in detail, and suggestions made for the treatment of ornament generally. The restlessness of contemporary architecture, and the tendency to mingle incongruous forms and materials in the same composition, were noticed, and the necessity for repose and unity of design was insisted on. The movement to abandon the study of past architecture, the reason for it, its chances of success, and the subject of originality generally were discussed. It was pointed out that originality requires knowledge and a cultivated taste to guide it if practical, and aesthetic pitfalls are to be avoided; and the continued and thorough study of architectural history was strongly advocated. Attention was called to errors in the scale of the details and parts of buildings, and the lecturer suggested that the matter of scale should be especially and carefully watched where original forms are used. In connection with the question of scale he said a few words about the difficulty introduced by large sheets of glass, and pointed out a treatment that has been partially successful in certain cases. A number of errors were condemned as sins against common sense; among them the construction of arches that obviously would not stand without the aid of a concealed girder, corbels that are many times larger than necessary, queer-shaped windows, and the transfer of forms appropriate to one material to another. Errors in the use of terracotta were attributed to a similar cause, and its better application in the past was referred to. In connection with errors of proportion it was suggested that the source of our ideas on the subject is really to be found chiefly in what the eye is most used to, and that modifications of customary ratios may be successful if they be systematic and not exaggerated. The lecturer referred to the frequent neglect of opportunities in planning to provide for architectural effects, especially interior ones, and to the influence of the position of windows on interior effects. On the motion of Mr. E. M. Gibbs, seconded by Mr. J. B. Mitchell Withers, and supported by Messrs. W. C. Fenton, F. W. Chapman, and W. J. Hale, a hearty vote of thanks was given to the lecturer.

The death of Mr. David Pearson, builder, Dundee, took place at his residence, 20, County-place, on Wednesday in last week. The deceased was widely known, having been a master builder for the long period of thirty years. For some time he was a partner with Mr. Miller, and during that time many important contracts were carried out. After the partnership had been dissolved, Mr. Pearson carried on the business alone. Latterly he has been assisted by his son, Mr. Thomas Pearson.

During the ten years 1889-98 over 1,200 students have attended the Building Construction Classes at the City of London College under Professor Henry Adams, and nearly one half have sat for the Science and Art Department Examination, with a resulting success averaging 50.23 per cent. in the elementary stage, 91.32 per cent. in the advanced stage, and 28.57 per cent. in the honours stage. This is believed to be a record achievement.

The upper floor of the cottage hospital at Dumfermline, built a few years since from designs by Mr. Sydney Mitchell, of Edinburgh, was destroyed by fire on Saturday afternoon. Arrangements have already been made for rebuilding the edifice under the original architect's direction.

The Cardiff Town Council, who recently completed the purchase for £158,500, of Cathay's Park, as a site for the proposed new Town Hall, have rejected, by 22 votes to 8, a motion for delaying the erection of the new town-hall and law-courts.

### Engineering Notes.

**LIGHT RAILWAYS.**—The Board of Trade have recently confirmed an order amending the Flam-borough and Bridlington Light Railways Order, 1897. A meeting took place at the Board of Trade on Friday to consider, prior to confirmation, an order which has been made by the Light Railway Commissioners authorising a light railway at Ventnor. The proposed railway will run from the pier through a tunnel to Church-street, in the centre of the town, where there will be a station. Thence it will run across Marlborough-road, through the grounds of St. Catharine's Home, under Goldwell House and Grove-road, and via Primrose Bank and the electric light station to the existing station of the Isle of Wight Railway, which it will connect with by means of an arcade. From this point it will rise to the top of St. Boniface Down. From the station in Church-street to Goldwell House the line will be made on a viaduct, the remainder being in tunnel. The total length of the line will be about 1,100 yards. The section from the Isle of Wight Railway station to the top of the down is constructed chiefly with a view to meeting the demands of pleasure traffic, the other portion being designed more to meet the general requirements of the town, pier, and railway traffic. The motive power will be electricity. Objection was taken on behalf of Mrs. Evans, the owner of St. Boniface Down, in regard to the granting a lease of the down for the purpose of the railway. Subject to some minor alterations required by the Board of Trade, the order will be confirmed in the usual way.

### CHIPS.

The school board for Rotherfield, East Sussex, have adopted plans submitted in limited competition by Mr. Parris for an infant school for 200 children to be built at Crowborough.

A large clock has just been fixed in the parish church at Eccleston, Lancashire, by John Smith and Sons, Midland Clock Works, Derby. It has two dials, and strikes the hours upon a large bell.

Mr. James Tait, burgh engineer, Wishaw, died suddenly, on Sunday, at his residence, at the age of fifty-eight years. He had suffered from an affection of the heart, and the strain entailed on him in connection with the promotion and execution of the large water scheme for the burgh, which is at present being carried out, told severely on his constitution. The deceased has acted as burgh surveyor for almost a quarter of a century. He leaves a widow and two sons.

At a meeting held at Nottingham last week, it was reported that about £3,000 had been raised or promised towards building a new church in the Blue Bell Hill district. The plans were prepared by the late Mr. J. L. Pearson, R.A., and after some discussion on the relative cost and merits of brick v. rock-faced stone as a facing material, it was decided to ask the present architect, Mr. Frank L. Pearson, to report on the point, and to commence building operations in the spring.

Eight carved panels, representing scenes in the life of Our Lord, have been placed in the new reredos in All Saints' Church, Peterborough. They have been executed by Mr. W. Allan, of that city.

An inquest was held on Friday evening at the General Hospital, Nottingham, by the city coroner, touching the death of Frederick Filtess, aged 23 years, of 76, Radford-boulevard, who sustained fatal injuries by a fall from the roof of the Great Central Railway new goods-shed in the Meadows on the previous day. The contractor is Mr. Enoch Hind. A verdict of accidental death was returned.

On Tuesday week a new infants' block at the Cardiff Workhouse was opened. The building was erected by Mr. Joseph Thomas to the designs of Mr. Edwin Seward, of Cardiff, and Mr. Scott was the clerk of works; whilst Messrs. John Williams and Sons fitted up the hot water and heating arrangements. The cost of the building was £1,870.

In the National Telephone Co.'s extensive new premises, Belfast, after special consideration, the system of combined warming and ventilation of John King, Ltd., Liverpool, is decided on, employing their "Rajah" ventilating radiators, and "Rex" electric air propellers for removing foul air and supplying fresh air—warmed in winter, cooled in summer.

A writ has been issued against the Swansea Intermediate Committee in respect of the commission claimed by Mr. W. Wills, architect, in connection with certain abandoned buildings, and the town clerk has been directed to enter an appearance on behalf of the defendants.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—T. G.—F. S. and Co.—N. B.—S. C.—P. C.—M. H.—J. W. Son.—B. P. R.—F. G.—D. H.

## THE LONDON BUILDING ACT.

To the Editor of the BUILDING NEWS.

SIR,—Your reporter has so condensed my opening remarks at the Surveyors' Institution that they appear nonsense. Fortunately, most of your readers know that district surveyors have nothing whatever to do with scavenging, paving, &c., so that the words "district surveyors did their work of scavenging, &c., not less completely than parish surveyors," will rather surprise them. What I said was, "If some of the district surveyors wished they could find many shortcomings in the parish surveyors of London—of repairs to pavements neglected, the scavenging badly done."

The surveyors are probably not to be blamed personally, as they are instructed by the committee of the vestry; but it must be apparent to anybody that our streets and pavements have recently been in a deplorable condition.

I could not follow Mr. Wheeler's remarks, that the fees being added to the cost of building eventually fell upon the tenant. Surely they would more directly fall on the tenants if the salaries came out of the rates. The tenant pays rent for a building according to its value, not on what it cost.—I am, &c.,

HENRY LOVEGROVE,

District Surveyor of S. Islington and Shoreditch.  
124, High-street, Shoreditch, E.

The urban district council of Litherland, Lancs, has appointed Mr. W. H. Foster, of Burnley, as assistant-surveyor and building inspector.

## Intercommunication.

## QUESTIONS.

[12155.]—**Block-Tin and Cement.**—Would any of your readers kindly give their experience of block-tin gas-pipe imbedded in Portland cement? I have had recently taken from a new building some pieces of piping which were quite eaten through as if by some acid, with the result that the gas was found to be escaping freely. I shall be glad to hear of any cause and possible remedy for this, to me, new difficulty.—J. P. G.

[12156.]—**Copper Roofs.**—Will any experienced in copper inform me whether a copper roof can be laid in the same manner as one of zinc? What are the differences, if any, in joining the sheets? Are rolls or welts used, and what kind of fixing is necessary?—INQUIRER.

[12157.]—**Baths.**—Which are generally used for superior houses? I presume copper baths enamelled are the best. Where should the hot and cold supplies enter, and the overflow be taken from? Also the best mode of trapping waste? Are there any advantages in cast-iron baths?—AMATEUR BUILDER.

[12158.]—**Right of Light.**—A neighbour has extended and raised his projecting offices at the back of his house, which has materially darkened the back room of my house. Have I not a right of light over his back yard? If so, can I claim compensation? Will some expert answer?—OWNER.

[12159.]—**Lime Burning.**—Will any reader kindly state where I can obtain particulars for building improved kiln for burning grey lime?—G. H. B.

[12160.]—**Damp in Safe.**—What is the cause of damp in a safe? It is fixed in an inside wall. The wall is perfectly dry. I may say there is a cavity of 2in. round the safe filled up with borax and cement.—NEMO.

## REPLIES.

[12152.]—**Architect's Charges.**—I think that "Art" should charge five per cent. on all the work executed, two and a half on all portions of the building designed, but not executed; and a charge based upon the time occupied for the designs for fittings. Time occupied travelling to the job is a much-discussed question, operating in favour of local architects, and really one must consider that 2½ per cent. is paid for superintendence.—H. L.

[12152.]—**Architect's Charges.**—Unless the owner gave special instructions to prepare designs for fittings, I would consider that an architect had exceeded his commission in doing so, and that he was not justified in asking payment for the same. Internal fittings are simply furniture fixed in position with screws, nails, &c., to the building. The architect's business is to make all the details and drawings for the building only, and if he attends well to this he may leave the furniture and interior fittings to those who, by their education and training, are better able to do it. It savours much of the egotist for an architect to lay down the law in this matter. Most cultivated men and women have more or less their own tastes and fancies in regard to the interior decoration of their homes, and this need in no way offend the architect, who is only there to provide the building proper. It is well known that the largest manufacturers of fittings employ the best talent that can be obtained in the preparation of designs—men who have made a life-long study of the subject, and who have the best opportunities for the work. It might perhaps be as well if "Art" would condescend to become more like the despised "so-called architects, civil engineers, and surveyors": he would perhaps add to his business and find it more to his profit than dabbling with fittings. Architects are not all heaven-born with genius to do the work required for every department of art. I have been thirty years an architect, and have never found time to interfere with the furnishing of my clients' homes, nor have I any desire to do so.—ED. CALVERT.

[12154.]—**Dictionary of Terms.**—Perspective. There are about a score of dictionaries in the R.I.B.A. library. The most complete work is the dictionary of the Architectural Publication Society. See also the later pages of Gwilt.—H. L.

The partnership hitherto subsisting between F. A. Tugwell and S. Tugwell, of Scarborough, architects and surveyors, under the style of F. A. and S. Tugwell, has been dissolved.

At the meeting held at St. Alban's Cathedral on Saturday afternoon, it was decided to proceed with the completion of the high altar screen, from the designs by Sir Arthur W. Blomfield, A.R.A., in accordance with a faculty recently procured. Mr. Harry Hems, of Exeter, was instructed to proceed with the work in conjunction with Mr. Alfred Gilbert, R.A., M.V.O.

On Sunday week, at St. George's, Perry Hill, a large three-light stained-glass memorial window was dedicated by Canon Rhodes Bristow. This window is the beginning of a series, each to represent three great Churchmen from different centuries, and contains Archbishop Benson; Bishop Patteson, the Martyr-Bishop of Melanesia; and Archbishop Alexander, Primate of All Ireland. The arms of the respective sees appear in the trefoils. The window was designed and executed by Messrs. Bacon, of Newman-street. In the sanctuary of the same church two interesting stained-glass windows were erected a short time ago, executed by the same firm, representing the three great missionary Bishops of Europe, Asia, and Africa (St. Leo the Great, St. Ignatius, and St. Cyprian), and of Great Britain and Ireland (St. Augustine, St. Columba, and St. Patrick).

## WATER SUPPLY AND SANITARY MATTERS.

LONDON WATER COMMISSION.—The Royal Commission on the question of the water supply for London resumed their sittings on Monday at the Guildhall, Westminster. Viscount Llandaff, the chairman, announced that it was intended to refer the examination of the different estimates of the Welsh scheme and the Thames storage proposal to Colonel Rathborne, C.E., who would privately hear any witnesses that might be tendered on the subject. Counsel, on behalf of the London County Council, protested against the course proposed, and said they would object very much to Colonel Rathborne anticipating the action of Parliament by any report upon the Welsh scheme. The representatives of the water companies offered no objection to the suggested inquiry. The chairman said an inquiry before Parliament would not be in the least prejudicial. The Commissioners had simply called in an expert to assist them in regard to the estimates. Mr. C. Hawksley, C.E., then gave further evidence in support of the case of the water companies. In his experience water undertakings were better managed by private companies than by public authorities. Mr. E. M. Eaton, C.E., expressed himself as being in entire agreement with the evidence given by Mr. Hawksley. On Tuesday evidence was given by Sir W. Crookes to the effect that filtration was effectual in the removal of microbes from the Thames water, whether in flood or not; that microbes were developed much more freely in conduits and pipes than in reservoirs; and that the whole question of microbes was sentimental rather than practical. Professor Dewar gave evidence generally in accord with that of Sir W. Crookes. Sir E. Frankland, of the Local Government Board, was under examination when the commission adjourned.

NANTLE VALE.—The works of water supply, which have been executed by Mrs. Bugbird and Son, were on Saturday formally handed over to the local authorities. They represent a cost of about £5,000, Mr. Lloyd Jones, county surveyor, Carnarvon, being the engineer of the scheme. The water is drawn from Dulyn Lake, situate in the mountains above Nebo.

## CHIPS.

The well-known Christ Church in New-street, Birmingham, is being demolished by workmen in the employ of Messrs. J. Benton and Sons, of Great Barr-street, in that city.

A new Bible Christian schoolroom at Tintagel, North Cornwall, was opened on the 10th inst. It has been built from plans by Mr. Mason, of Marshgate, architect, the stone being given by the Earl of Wharncliffe. On the first floor there is a room seated for 200 persons.

The new mission church of St. Saviour in St. John's parish, Coventry, has been opened by the Bishop of Worcester.

At Cwmbran, near Caerleon, a new police-court and station was opened on Thursday in last week. The building is situated near the railway station, and has been erected from plans by Mr. W. Tanner, county surveyor of Monmouthshire.

No. 62, Rodney-street, Liverpool, is an historic mansion. It was the residence of Sir John Gladstone, and in one of its upper rooms there first saw the light William Ewart Gladstone, on December 29, 1809. Permission has now been conceded by the owner of the property to the Historic Society of Lancashire and Cheshire to affix a commemorative tablet to the house—a tablet which will record the dates of the birth and death of the great statesman.

A literary institute is to be built at Gateshead, from plans by Messrs. Armstrong and Knowles, of Newcastle.

At the last meeting of the Council of the Royal Society of Painter-Etchers and Engravers, the following gentlemen were elected members of the society:—Messrs. Meyer, Milner, Newbolt, Tomkins, and Wright.

The dedication of the stained-glass window, which has been placed in the church of St. Mary Stoke, Ipswich, as a memorial to the late rector, Canon Bulstrode, took place on Sunday. The window, of which Messrs. Heaton, Butler, and Bayne, of London, are the artists, is the one nearest to the chancel on the south side of the nave. The first light represents the Annunciation, the central light contains a representation of the Blessed Virgin with the Infant Saviour in her arms, and the third light a picture of St. John leading the Blessed Virgin from the cross, after our Lord had commended her to his care. In the tracery at the head of the window, the connection of St. Mary Stoke with the cathedral church of Ely (the Dean and Chapter of Ely being the patrons of the benefice) is marked by the introduction of the arms not of the diocese of Ely, but of the priory church of Ely, that is, of the Dean and Chapter.

## Our Office Table.

THE Examination Committee of the Society of Architects report that the first examination for admission to the Society was held on the 5th, 6th, and 7th of October, 1898. Three candidates originally entered, but one withdrew owing to unavoidable circumstances. Of the remaining two, one failed to obtain the minimum quantity of marks required for a pass, while the other, Mr. A. Scott, of 16, William-street, Drogheda, obtained over 75 per cent. of marks, and has been awarded the silver medal of the Society. The next examination under the auspices of the Society will be held at St. James's Hall, Piccadilly, W., on the 12th, 13th, and 14th of April next, commencing each day at 10 a.m., and terminating at 5 p.m., with an interval of one hour from 1 to 2 p.m. The latest date of entering for the examination is March 23. Candidates under 22 years of age will not be permitted to sit for examination. The fee will be £2 2s., and no examination papers will be issued to candidates who have not paid their fee in advance. In the event of failure to qualify in any of the compulsory subjects, a candidate may be admitted to a subsequent examination in these for a fee of £1 1s. All those who qualify will be admitted to membership of the Society, after election, on payment of half the usual entrance fee. The Gold Medal of the Society will be presented to the candidate passing highest in the examination, provided he shall have obtained a Special Certificate of Honours. A Silver Medal may also be awarded to such candidate as may be recommended by the examiners. The examiners may also recommend the award of a certain number of Bronze Medals, the number to be determined by the standard reached by the candidates at each examination.

A VALUABLE addition to the art treasures of the British Museum is made by the bequest from Baron Ferdinand de Rothschild of his cinque cento collection. This includes plate, enamels, bijouterie, carving in boxwood, glass, arms, and armour, and other articles, being the principal works of art in the smoking-room at Waddesdon, and also a book of drawings entitled "Funeral Processions," and all his illuminated missals and manuscripts. It is estimated that the value of the entire bequest to the nation is fully £300,000. It will be a perpetual reproach and source of regret if the Trustees should, as it is alleged they propose doing, stow away this magnificent collection in the out-of-the-way, badly-approached, and inappropriate corner of the Museum now used as the workroom and library of the Department of Greek and Roman Antiquities.

DURING the past year important additions and rearrangements have taken place in every section of the collections in the Museum of Science and Art at Edinburgh. The most noticeable new feature is a cast of the statue of St. George, sculptured by Donatello for the outer wall of the Orsan Michele at Florence. The statue, with the niche in which it stands, has been reproduced for the first time in this country as a complete architectural composition. Casts of the panels of the bronze gates, designed in competition for the Baptistery of Florence by Ghiberti and Brunelleschi, are hung side by side. A few bronze and brass cire perdu casts from the city of Benin are shown in the ethnological section, and also some of the finds made by Professor Flinders Petrie in his recent excavations in Egypt. The additions to the Furniture Hall include some Flemish tapestry and two cabinets—one a fine example of 16th-century work from Lyons, the other a highly-decorated specimen of Louis XV. work.

THE Company of Plumbers entertained to dinner on Wednesday night, at the Salters' Hall, the Lord Mayor and the Sheriffs of London. Mr. Alderman Richard Hind, the Master of the Company, presided, and there were present Mr. Frederick Machin, Warden; Mr. Charles Hudson, Renter Warden; and Mr. W. R. G. Coles, Clerk. The guests included the Lord Mayor of Belfast, the Lord Mayor of Leeds, the Lord Mayor of Sheffield, Sir R. Hanson, M.P., Sir George Kekewich, Mr. T. W. Russell, M.P., Sir Henry Craik, and others. The Master proposed "The Lord Mayor and Corporation"; the Lord Mayor responded. Mr. P. Stebbings gave the toast of "The Houses of Parliament," to which Mr. T. W. Russell replied, in a humorous speech, in which he expressed approval of the principle of registration for plumbers. The Lord Mayor proposed

the toast of "The Plumbers' Company," the Master of the Company replying.

THE picturesque ruins of Inverugie Castle, near Peterhead, the ancient seat of the Earls Marischal, were demolished by dynamite on Saturday afternoon. A part of the ruins fell on the previous Sunday, during the storm of wind and rain, and as the remains of the castle stood in close proximity to a much-frequented public road, it was thought advisable by Colonel Ferguson, on whose estate the historic ruin is situated, to demolish the remaining portion in case of accident to passers-by. Considering that the castle is nearly 600 years old, and that it is considerably more than a century since it was occupied, it was until recently, the *Scotsman* remarks, in a fairly good state of preservation, and with a little expenditure could have been maintained the prominent landmark which it was for many years to come.

At a meeting of the Architectural Section of Glasgow Philosophical Society, held on Monday evening, Mr. James Chalmers read a paper on "The Mansions of Scotland." Mr. Macgregor Chalmers presided. The lecturer dealt more particularly with the works of the late David Bryce, R.S.A., Edinburgh, who erected about fifty Scottish mansions. His work contained all that was good in that of Adam and his other contemporaries, and, in the opinion of the lecturer, none of the mansions erected since Bryce's death excelled, if they even equalled, Ballinkirn or Sir Robert Jardine's Castle-milk, as representing possibly his finest Scottish baronial buildings, or Langton Grange, near Duns, as illustrating his Elizabethan mansions. The lecturer gave illustrations of the castles and mansions from which Bryce received much of his inspiration, and gave reminiscences of the architect's life and character. The remaining part of the lecture was occupied with a comparison of Mr. Bryce's Ballinkirn on the one hand, and Bute House, which might be considered not only one of the most modern, but the most pretentious of Scottish mansion-houses, on the other.

MESSRS. WM. POTTS AND SON'S, clock manufacturers, Guildford-street, Leeds, have just completed in the Grand Arcade at Leeds something really worth seeing in the shape of a public clock with bells, automaton figures, cock, &c. The dial is of polished copper, while the hands are symbolic of the sun and moon. On each side stands an armour-clad knight bearing a battle-axe, with which he strikes the quarter-hours upon a bell hung before him. These are the only two figures in view until the hour arrives, when, after the quarters and the hour have been struck, a door opens, and from it emerges a procession of five figures representative of the British Empire. First comes a British soldier, who on reaching the centre of the platform faces to the front and makes a military salute. He is followed by a kilted Highlander, an Irishman carrying a threatening-looking shillelagh, a Canadian boatman, and a turbaned Hindoo, each of whom in turn faces to the front, bows, and marches off. This is not all, however; as soon as the last of the figures has retreated a life-size rooster perches above the dial, flaps his wings, and crows three times, when the performance is over for another hour. The same firm are fixing a large illuminated quarter-chime clock at the parish church, Leeds.

At the last meeting of the City Court of Common Council a contract was signed between the Corporation and Mr. J. Strachan, for the construction of a tramway and railways in connection with the Foreign Cattle Market at Deptford, at a cost of £3,997 15s.

At the meeting, on Saturday, of the Herefordshire County Council it was reported that a contract has been entered into with Messrs. William Bowers and Co. for the enlargement of the county and borough of Hereford Lunatic Asylum at a cost of £22,525. Of this £17,794 will be payable by the county, and £4,730 by the city. The work is to be completed within two years.

The nave and aisles of the new church of St. Alban, Westcliff-on-Sea, Essex, have been dedicated by Archdeacon Stevens. Westcliff-on-Sea is to the south-west of the parish of Prittlewell, of which Southend-on-Sea forms a large part, and building operations are progressing rapidly in this district, some fifty-two roads having been marked out for building purposes, or partially built upon. The old font from St. Mary-le-Bow, Cheapside, has, with its handsome cover, dated 1675, been presented to the church.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. "The Rating of Collieries," by Edward Boyle, Q.C. 8 p.m.  
Royal Institute of British Architects. Address to Students by the President, Professor G. Aitchison, R.A. 8 p.m.  
Society of Arts. "Bacterial Purification of Sewage," Cantor Lecture No. 2, by Dr. Samuel Rideal. 8 p.m.  
Liverpool Architectural Society. "Enamels," by Robert Hilton, Law Library, Liverpool. 8 p.m.  
Leeds and Yorkshire Architectural Society. "A Summer in Umbria," by H. M. Fletcher, M.A.  
TUESDAY.—Society of Arts. "Rhodesia and its Mines in 1898," by W. Fischer Wilkinson. 4.30 p.m.  
Institution of Civil Engineers. Discussion on "Steel Rails: their Wear and Micro-photography." 8 p.m.  
WEDNESDAY.—Society of Arts. "Tuberculosis in Animals," by W. Hunting. 8 p.m.  
THURSDAY.—Society of Architects. "The Supervision and Regulation of Building Operations, as Exercised by the Edinburgh Dean of Guild Court," by David Lyon, Clerk to the Dean of Guild, Edinburgh. St. James's Hall, Piccadilly. 8 p.m.

## The Society of Architects.

Founded 1884. Incorporated 1893.

THE THIRD ORDINARY MEETING of the Society of Architects for the Session 1898-99 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, January 26th, 1899, at Eight o'clock p.m., when a Paper will be read by DAVID LYON, Esq., Clerk to the Edinburgh Dean of Guild, entitled "THE SUPERVISION AND REGULATION OF BUILDING OPERATIONS AS EXERCISED BY THE EDINBURGH DEAN OF GUILD COURT."

ELLIS MARSHLAND, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.

## CHIPS.

The Bishop of London will open the ward for cancer and the nurses' home at the new Hospital for Women, Euston-road, on February 1.

A carved oak pulpit is being made by Messrs. Sharp and Emery, of Dublin, for Clonfert Cathedral at a cost of £190. It will be similar in design to the pulpit given by Lord Ardilaun to Raheny Church. The pulpit is the gift of Mr. Thomas Roderick O'Connor, in memory of his mother. Mr. O'Connor has already presented the cathedral with two stained-glass windows, and a memorial brass, in commemoration of the Queen's Diamond Jubilee.

Colonel John Morgan, the mayor of Brecon, has signified his intention of laying down, at his own cost, plant for the electric-lighting of the town. It is estimated that this will practically mean a gift of £6,000.

A question as to how to arrive at the "average weekly earnings" of a workman under the Compensation Act was decided by the Court of Appeal on Saturday. In a claim against the Barrow Hematite Steel Company, the Judge, settling the amount of a man's weekly wage by the sum he could earn in a year, divided the total by the number of weeks actually worked, and the company appealed. The Lords Justices held that the total salary, for the purposes of the section, must be divided by the number of weeks in the year, and not by the number a man was really at work. They, therefore, allowed the appeal.

The Lord Provost's Committee of Dundee Town Council have been informed that the statue of her Majesty, entrusted to Mr. Harry Bates, London, to be erected in Dundee by way of celebrating her Majesty's Jubilee, is now completed. It was decided that steps be at once taken to have the statue brought North, and it was provisionally agreed that it should be erected on the site occupied by the fountain immediately in front of the grand staircase of the Albert Institute, and to remove the fountain to a site on the north side of the Albert Institute buildings.

On behalf of the Local Government Board, Dr. G. S. Buchanan held an inquiry at Malvern on Friday respecting an application made by the Malvern Hospital Committee to the Worcestershire County Council for sanction to a loan for the purposes of an infectious hospital. Mr. Thornley (clerk to the County Council) explained that a loan of £9,850 had already received sanction, and a further £684 was required. The hospital will be erected at Bundy's Farm, Half Key, two miles from Malvern, from plans by the surveyor to the urban district council; it will provide 22 beds.

At the Norwich Consistory Court at the Cathedral, Norwich, on Saturday, Mr. Overbury made a formal application for a faculty for building a porch and clock-tower on the south side of the Church of St. Mary, Walton, near Felixstowe, on the site of a tower which has been a low ivy-clad ruin for many generations. Mr. Chancellor Blofeld said the application would be granted.

## Trade News.

## WAGES MOVEMENTS.

**THE SKILLED LABOUR MARKET.**—The monthly report of the Labour Department states that the general state of employment continues good. In the 118 trade-unions making returns, with an aggregate membership of 470,391, 13,612 (or 2·9 per cent.) were reported as unemployed at the end of December, compared with 2·3 per cent. a month before, and 5·3 per cent. in the 113 unions, with a membership of 480,866, from which returns were received for December, 1897. Employment in the building trades has continued good, though painters and decorators and plumbers are not so busy. The percentage of unemployed union members at the end of December was 1·8, compared with 1·1 in November, and 2·8 in December, 1897. The furnishing trades, though still well employed, are scarcely so busy in some branches. The percentage of unemployed union members at the end of December was 3·8, compared with 2·3 in November, and 4·7 in December of 1897. Twenty-nine fresh disputes occurred in December, 1898, involving 6,319 workpeople. Three of these disputes affected the building trades.

**LONDON PLASTERERS.**—A strike of plasterers has taken place at the works of three firms of London builders—Messrs. Higgs and Hill, Crown Works, South Lambeth; Messrs. G. H. Bywaters and Sons, King-street and Golden-square; and the Veronese Company, resulting from a demand by Mr. Hennessey, the secretary of the National Association of Operative Plasterers, that the foremen plasterers of these three firms should join that union. The building trade in the Metropolis is just now extremely active, and all the plasterers withdrawn have got employment elsewhere. It is stated that unless the officials of the National Association of Operative Plasterers retire from the position which has been adopted on their behalf, that all foremen plasterers shall become members of their body, there is very little doubt that in a short time the members of that trade union will be locked out by all members of the Central Association of Master Builders in London, and there is every probability that a similar course will be pursued in the provinces also.

**NORWICH.**—Trouble has arisen in the building trade in this city, a number of bricklayers having struck work on a question arising out of the use of Broseley tiles. The men object to the employment of a slater to tile the roofs of several buildings now in course of erection, their contention being that the laying of pantiles and all tiles other than slates belongs to the bricklayers.

**NEWPORT, MON.**—The federated building trades of Newport have notified the masters of their requirements on and after May 1 next. In October last the Newport Master Builders' Association gave the workmen six months' notice as to certain alterations in the agreement subsisting between them; and now the men, having federated all workers engaged in the building trades, have replied with effect. The federation asks for an increased wage as follows:—Carpenters, plasterers, masons, and plumbers, 9d. per hour; mason fixers, 9½d.; bricklayers, 8d.; painters, 8d.; general labourers, 6d.; and scaffolders, drainers, and engine tenters, 6½d. per hour. The federation also demurs to working with non-unionists; hitherto society men and non-society men have worked amicably side by side. The masters require several alterations, some of which are the outcome of the prolonged strike of last spring and summer. The masters demur to the federation being able to call out their members by giving two hours' notice, and wish to obtain an extension of the conciliation idea, by which there shall be no suspension of labour pending the decision of the Conciliation Committee, which is composed jointly of masters and men. They also wish to enforce a schedule that the wages of the average skilled workman shall be 8d. per hour.

**PERTH.**—The operative joiners of Perth have communicated with the secretary of the Masters' Association asking an increase on the present rate of wages. The present rate is 8d. per hour, and the men ask an additional ½d. an hour. A meeting of the masters is to be held to consider the demand, and, as trade is brisk in the district, it is expected the demand will be conceded.

The stained-glass window placed in the chapel in Lathom Park in memory of the late Countess of Lathom has been completed, and was recently informally unveiled.

New classrooms which have been added to St. Peter's National Schools, Ipswich, were opened on Friday by Sir Charles Dalrymple, M.P. The existing schools, which were erected in 1837, have been remodelled, and accommodation is provided for 100 additional boys. Mr. Frank Brown, of Ipswich, was the architect, and Messrs. W. Grayson and Sons, of the same town, were the builders.

## CHIPS.

Alterations are being made to the Court House, Caerphilly, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

The death is announced of Mr. James Johnston, late master of works and sanitary inspector for the burgh of Clydebank. Mr. Johnston was master of works at the erection of the Singers' factory at Kilbirnie, and on its completion he obtained the burgh surveyorship, which failing health compelled him to resign two years ago.

Mr. E. J. Stown, C.E., assistant borough surveyor to the corporation of Huddersfield, late of Plymouth, has been appointed engineer to the tramway department of the Manchester Corporation. The corporation are about to take over the existing tramways in the city, at present worked by horses, and intend reconstructing the same for electric traction.

The town council of Southampton adopted at their last meeting a report by Messrs. Kincaid, Waller, and Manville recommending the improvement of the tramway system, the equipment of three additional miles of tramway-line and six miles of roadway, and the employment of electric traction by the overhead trolley system (already agreed to in principle by the corporation). It was decided to invite tenders for the various works, estimated to cost in all £64,000.

At Watford Place, Herts, on Tuesday week, Mr. E. H. Bicknell, an inspector from the Local Government Board, held an inquiry respecting the proposal of the Watford Rural District Council to establish a sewage farm for Radlett, close to Colney-street. Evidence in support of the proposal was given by Mr. Ernest H. Lisle, surveyor to the rural council, and Mr. Santo Crisp, C.E., of Westminster, and for the opponents of the scheme by Professor W. H. Corfield and by Mr. H. F. Mence, surveyor to the St. Alban's Rural District Council.

Mr. E. A. Sindford Fawcett, Local Government Board inspector, held an inquiry at the town-hall, Felixstowe, on Wednesday week, with regard to an application by the urban district council for permission to borrow £631 for forming a kerbed footpath in High-street and Lower-street, Walton. There was no opposition.

At a meeting of the Grimsby Town Council, on Friday, it was decided to apply to the Local Government Board for consent to borrow £43,500 for the carrying out of necessary works for electric light and power.

Mr. G. Topham Forrest, architect in the city engineer's office, Leeds, has been appointed to the post of assistant architect under the county surveyor at the County Hall, Wakefield.

The Jubilee Nurses' Institution, Cherville-street, Romsey, was opened by Princess Beatrice of Battenberg, on Wednesday week. It is built of red brick, with stone dressings, and contains two sitting-rooms, an accident ward, a kitchen, a bath-room, lavatory, and usual offices, three bedrooms, and one sick ward. The rooms are all supplied with gas, and electric bells are fitted to each. The contract for the building was carried out by Messrs. Wheeler and Son, at a cost of £425, from plans prepared by Mr. J. Jenvey, architect, of Romsey.

At the last meeting of the Bury St. Edmund's Town Council the sanction of the Local Government Board to the borrowing of £15,250 for electric lighting purposes, to be repaid in 25 years, was announced. The committee had obtained tenders for the erection of the necessary buildings, but recommended that fresh tenders be advertised for.

In the Chancery Division, on Friday, before Mr. Justice North, the case of Bulley v. Stephens came on for hearing. It was a motion on behalf of the plaintiff, Charles Henry Bulley, a builder, of St. Marychurch, Devon, for an injunction restraining the defendant, John Stephens, of Dartmouth, from selling under a mortgage leasehold property at Babbacombe valued at over £1,200. The defendant is the mortgagee, and the plaintiff is the mortgagor, and it was said that there was now owing to the former £900 under the mortgage, and a half year's interest. The action was dismissed.

Mr. H. P. Bulnois, Local Government Board inspector, conducted an inquiry at the public offices Tipton, on Friday, with respect to the application of the urban district council for sanction to borrow for gasworks extensions.

On Friday the Nantwich Urban District Council decided to adopt the bacteriological system of sewage disposal, and to invite Mr. Baldwin Latham to advise them upon the erection of works. The town sewage has hitherto gone into the River Weaver, and for a number of years pressure had been brought to bear on the council to provide sewerage works. The report of the Manchester bacteriological experts, of whom Mr. Baldwin Latham was one, gave the Nantwich Council their opportunity.

## FENCING AND WALLS.

Cheltenham—Reconstruction of Retaining Reservoir Wall .....	Corporation .....	The Borough Surveyor, Municipal Offices, Cheltenham .....	Jan. 23
Southwark Park—Oak Boundary Fencing .....	London County Council .....	The Parks Department, 9, Spring-gardens, S.W. ...	24
Bury, Lancs—Ornamental Wrought-Iron Railings (70 yards) at Buckley Wells .....	Sewering Committee .....	The Borough Engineer, Bank-street, Bury .....	25
Upper Witton—Boundary Walls, Small-pox Hospital .....	Aston Manor Urban District Council .....	H. Richardson, A.M.I.C.E., Engineer, Council House, Aston .....	25
Taunton—Inclosing Greenway Recreation Ground with Iron Fencing .....	Town Council .....	The Borough Surveyor, Corporation-street, Taunton .....	28
Tipton—Unclimbable Wrought-Iron Fencing, Victoria Park .....	Urban District Council .....	W. H. Jukes, Surveyor, Owen-street, Tipton .....	28

## FURNITURE AND FITTINGS.

Belfast—For Residential Flat and Office, East Bridge-street ..	Electric Committee .....	V. A. H. McCown, City Electrical Engineer, Belfast .....	Jan. 21
Batley—Internal Fittings, Warwick-road Branch .....	Batley Co-operative Society .....	H. B. Buckley, Architect, Old Vicarage, Batley .....	23
Barrow-in-Furness—Desks, &c., Three Schools .....	School Board .....	W. Hutchinson, Clerk, Town Hall, Barrow .....	—

## PAINTING.

Manchester—All Stations on Line .....	Lancashire and Yorkshire Ry. Co. ....	The Engineer's Offices, Hunt's Bank, Manchester .....	Feb. 6
---------------------------------------	---------------------------------------	---	--------

## PLUMBING AND GLAZING.

Castleford—Six Dwelling-Houses, Crowther-street .....	J. Rowland .....	A. Hartley, Architect, Carlton Chambers, Castleford .....	Jan. 21
Glasgow—Electricity Station, Pollokshaw-road .....	Electricity Committee of Corporation .....	Andrew Myles, Architect, 143, West Regent-street, Glasgow .....	30

## ROADS AND STREETS.

Dartmouth—Footpaths .....	Urban District Council .....	T. O. Veale, Surveyor, Dartmouth .....	Jan. 21
Doxford—New Road .....	—	Jas. Stevenson and Son, Surveyors, Berwick-upon-Tweed .....	21
Woodford—Paving Gainsborough and Stoneycroft Roads and Radley-lane .....	Urban District Council .....	J. Elliott Smales, Surveyor, Council Offices, Woodford Green, Essex ..	23
Sheffield—Construction of Roads (500 yards) .....	W. H. Greaves Bagshawe .....	J. Dobson Townsend, Surveyor, Independent Buildings, Sheffield ..	23
Beckenham—Widening Bromley-road .....	Urban District Council .....	John A. Angell, Surveyor, Beckenham .....	23
Stoke Prior—Street Works .....	Bromsgrove Rural District Council .....	H. W. Smith, Surveyor, Foregate-street, Worcester .....	23
Bargoed—Construction of Roads .....	—	George Kenshole, Architect, Ystrad Mynach .....	24
Dewsbury—Paving and Flagging Day's Yard .....	Corporation .....	Henry Deardon, Borough Surveyor, Town Hall, Dewsbury .....	24
Whitchurch—Street and Sewer Works .....	—	Charles Rigg, Architect, Albert Chambers, High-street, Cardiff .....	24
Southsea—Construction of Road .....	—	Algernon E. Johnson, C.E., Egerton-street, Wrexham .....	24
Bury, Lancs—Paving and Kerbing Streets .....	Sewering Committee .....	The Borough Engineer, Bank-street, Bury .....	25
Newington Green—Widening of Road .....	Vestry of St. Mary, Islington .....	J. Patten Barber, Chief Surveyor, Vestry Hall, Upper-street, N. ...	25
Cardiff—Paving and Channelling Streets .....	Corporation .....	W. Harpur, M.I.C.E., Borough Engineer, Town Hall, Cardiff .....	25
Hull—Paving, &c., South Side Victoria Dock .....	North-Eastern Railway Company .....	T. M. Newell, Engineer, Dock Office, Hull .....	25
Withington—Making-up Streets .....	Urban District Council .....	A. H. Mountain, A.M.I.C.E., Surveyor, Town Hall, Withington ..	26
Middlesbrough—Street Repairs .....	Streets Committee .....	Frank Baker, C.E., F.G.S., Boro' Eng., Mun. Bldgs, Middlesbrough ..	26
Sunderland—Roadwork, &c. ....	Corporation .....	J. F. C. Snell, A.M.I.C.E., Dunning-street, Sunderland .....	27
Thornton—Paving Works .....	Urban District Council .....	John Drake and Son, Winterbank, Queensbury, near Bradford .....	28
Hornsey, N.—Road and Sewer Works .....	Urban District Council .....	E. J. Lovegrove, Engineer, Southwood-lane, Highgate, N. ...	30
Enfield—Making-up St. Mark's-rd., Bush Hill Park, & East-rd. ....	Urban District Council .....	R. Collins, Surveyor, Court House, Enfield .....	Feb. 1
Mexborough—Construction of Helena-street .....	Urban District Council .....	G. Fenwick Carter, C.E., Surveyor, Council Offices, Mexborough ..	1
St. Thomas—Maintenance and Repair of Roads (Three Years) ..	Rural District Council .....	James Bray, Surveyor, Alington .....	1
Burgess Hill—Footpath at Church-road .....	Urban District Council .....	A. F. Hardwick, Clerk, Burgess Hill, Sussex .....	2
London, N.W.—Paving Finchley-road with Jarrah Wood .....	—	—	—
Cardiff—Road Formation & Sewer Works, Penllyn Castle Estate ..	Vestry of St. John, Hampstead .....	Arthur P. Johnson, Vestry Clerk, Vestry Hall, Hampstead .....	2
Heckmondwike—Constructing Birkhead-street .....	—	Veall and Sant, Architects, Cardiff .....	—

Farnworth—Hard Setts (3,000 tons) .....	District Council .....	David Crossley, Clerk, Council Offices, Farnworth .....	—

## CHIPS.

The urban district council of Cromer have decided, subject to the approval of the Local Government Board, to adopt a septic system of sewage disposal prepared by Messrs. Cameron, Commins, and Martin, of Exeter. The estimated outlay is £2,000.

A carriage works company in the North have secured a site of about 50 acres of land from the London and North-western Company at Gresty, near Crewe, and purpose to erect works at once. These will furnish employment for between 500 and 1,000 men.

The Handsworth Urban District Council have applied to the Local Government Board for sanction to borrow £17,500 for works of sewerage, £15,030 for a depot in Queen's Head-lane, £4,000 for street improvements, £2,362 for improvements and additions to Victoria Park, £2,200 for the erection of a fire station, and £770 for a refuse destructor. In consequence of this application, Mr. H. P. Boulnois, one of the inspectors of the Local Government Board, held an inquiry on Friday at the Council House, Handsworth. Details of the proposals were given by Mr. E. Kenworthy, surveyor.

The town council of Batley have adopted by a large majority a resolution authorising the erection of a new town-hall at a cost not exceeding £30,000.

At Downpatrick Quarter Session, on Saturday, James Jennings, labourer, was awarded 17s. for life under the provisions of the Workmen's Compensation Act for the loss of both eyes in an explosion of dynamite at Belfast Waterworks.

A new Baptist hall has been erected in Buddle-road, Benwell, from designs by Messrs. Badenoch and Bruce, of Newcastle-on-Tyne. It seats 250 persons, and there are also classrooms and infants' room. Mr. R. W. Maughan was the contractor.

The town council of Southwold, having applied to the Local Government Board for sanction to borrow £6,000 for works of sea defence, on Tuesday week Mr. E. A. Sandford, A.M.I.C.E., attended at the town-hall in that borough to hold an inquiry. The town clerk (Mr. E. R. Cooper) placed the requirements of the corporation before the inspector, and the surveyor (Mr. Ball) explained the plans, stating that, in addition to the proposed works, some £2,000 was now being expended on groynes.

St. John's mission church at Driffield is now being demolished, and will be replaced by a new church, to be erected at a cost of £4,000, towards which £1,500 has been obtained from the Marriott fund.

New board schools have just been opened at Roydon, near Diss. Mr. H. G. Bishop, of Stowmarket, was the architect, and Mr. Eldon J. Smith, of Bunwell, the contractor.

The parish church of South Wytham, Grantham, Lincolnshire, well known for its architectural beauties, has been compulsorily closed on account of its dangerous state, and the rector makes an appeal for funds to aid in the restoration. The cost of rebuilding the fabric amounts to £2,000, and the Earl of Dysart has consented to subscribe half that sum, if the remainder be forthcoming.

The preliminary arrangements for the holding of the forthcoming art loan exhibition in the art gallery at the City Guildhall are in full progress. The exhibition, which will be opened on April 10th, will represent the great painter Turner by an adequate collection of his works in oils and in water-colours, and also by a collection of plates from the *Liber Studiorum*.

## BUILDING SUPERVISION IN THE METROPOLIS.

COMPLAINTS and grievances of the dual control exercised by district and vestry surveyors are frequently made, which show that the present overlapping of areas in the Metropolis is fraught with much inconvenience, delay, and disagreement. Nor can we wonder at the want of agreement between authorities having different rules and by-laws. Look at the many Acts affecting the Metropolis as to sanitary matters alone. The Metropolis Management Act, 1855, gives power to the vestry or district board to regulate, inspect, and order all drainage; the Public Health (London) Act, 1891, which extends the Public Health Act to the Metropolis, confers power on the London County Council to make by-laws with respect to various sanitary matters, as to the removal of refuse, the proper construction of sanitary fittings and apparatus; and their by-laws extend to various important details—as soil-pipes, cesspools, and the like; and then there is the London Building Act of 1894, which controls the equally important matters of low-lying sites, open spaces, roofs, height of buildings, habitable rooms, separation of buildings, &c. All these Acts and by-laws have been framed to meet increasing and urgent wants from time to time; but they have grown into a bewildering and confusing mass of legislation, very baffling to the innocent and well-intentioned builder, as well as exceedingly welcome to the "old hand" or speculative builder. The multiplication of applications and notices now required is quite perplexing and unnecessary for public protection; but this state of perplexity will continue till the surveyor of the local authority is merged into the district surveyor, or their powers are clearly defined. It is not uncommon for a set of plans to have to be submitted to two or more authorities, and what one authority passes the other finds fault with. Then delay ensues, the matter has to be discussed by committees of antagonistic bodies, who act under different Acts of Parliament.

The paper read by Mr. W. Weaver at the Surveyors' Institution on "The London Building Act and the Official Supervision of Buildings," and the discussion thereon (see our report, p. 55), opened up a few questions. The working of the Act is not all that it should or might be. Mr. Weaver thought the remedy for the defects in the present system of supervision was to be sought for not so much in amendment of the Act as in the system of supervision adopted in enforcing it. The author advocated the transfer to the local authorities of the duties now performed by the district surveyor, which would, he thought, result in public benefit and administrative economy. That there is much to be said for such an arrangement cannot be open to any doubt. That the details of construction, sanitary and otherwise, would be more efficiently supervised by one than two conflicting authorities is a reasonable inference. Anyone proposing to erect a building would, in such a case, give notice to the local surveyor, whose offices would be at the town hall of the district. At this local centre every detail and requirement would be supplied, as it is at the public offices of a provincial town. Instead of having to submit plans for sewerage in duplicate to the parish or vestry, to conform to the requirements of the vestry official or in matters like those of walls and

frontage, and be subjected to his supervision after the structure is in progress, and the walls approved by the district surveyor, he would have to obey only one master. We can easily imagine a building advanced beyond the foundations in accordance with the requirements of the Building Act, when the vestry official interferes, and orders the removal of a drain or some setting back of the line of frontage. The district surveyor knows nothing of these matters, and merely directs his attention to the concrete in foundations or on site, the thickness of footings and walls, qualities of bricks and mortar, &c., while he may be ignorant of the existence of an old drain or cesspool immediately beneath the kitchen or parlour. Supervision ceases when the building is being covered in, thus giving the opportunity to a dishonest builder to erect a projection or a wooden shed to his building beyond the limits allowed, thus practically defeating the intention of the Act, and increasing the risk of fire. In fact, the supervision of the surveyor does not last long enough in some cases, in others it is vexatious.

As to the qualifications or training of a district surveyor—a question that arose out of the discussion—there are two opinions. By many, the training necessary for a surveyor competent to supervise buildings and to enforce compliance with Building Acts and by-laws should be rather different from that necessary for an architect. They argue that a district surveyor has to enforce regulations of the Act—details such as drainage, thickness of walls, composition of mortar, foundations, and that he has to suppress his artistic talents and architectural instincts. That, as the official policeman of the Building Act, he must not look on any extenuating circumstance of design, but dispassionately administer the law. The exercise of his duties is to some extent contradictory to art; to examine bricks and analyse mortar and concrete, to see that walls are of schedule thickness and timbers of certain scantling, that bearings are sound, and the like, must be foreign to skill in designing; the man with a good memory who has the sections of the Act at his fingers' ends, who is more technical in legal points and decisions, is the man to fill such an office. But the architectural training of the district surveyor counts for something. Like a man who has had a good or complete education, it may not be absolutely essential to his vocation, yet it exercises unconsciously a restraining and beneficial influence upon his decisions. Although he may in time forget a good deal of what he has learned, nothing will erase his sense of architectural propriety or proportion. It has been an all-abiding discipline to his mind. Of course we do not mean a mere cramming for the R.I.B.A. examination, a production of testimonials, a knowledge of historic art epochs, of drawing or of details, but a thorough training in the design and construction of buildings. Such a preparation as that afforded by a general practice as an architect must be of value. Of course, such a training is not all that is necessary for a surveyor. He must have had some experience in legal questions as well as in practical details and surveyor's duties, and some officials are without these special qualifications. If the district surveyor and the parish surveyor are to be merged, the dual qualifications will be more necessary. We should certainly be sorry to see some parish surveyors intrusted with important building supervision, however competent they may be in such matters as paving, scavenging, and the like. On this question the remarks by Mr. H. Lovegrove in his letter last week are to the point. The supervision of buildings demands, among other things, a practical knowledge derived from experience of the manner buildings were designed and carried out. Possibly out

of two methods, that which the architect favoured is better for the purpose than that which a local surveyor looking only to the letter of the Act might require to be done.

There are advantages and disadvantages also in local supervision. At present there is much friction experienced in passing plans and obtaining instructions between the central and local authorities; every owner and builder affirms this, and it seems reasonable that a man about to build, say, at Kensington, should only have to consult his local authority, and be done with it. The building committee of a vestry or their surveyor ought to know best the requirements of a building in their locality, whereas the central board in London may make an undesirable demand. On the other hand, local supervision is apt to be influenced by party interests. The building committees of the vestries are not always unprejudiced: sometimes there are members who have personal interests to serve, a fact too well known to admit of any question. In the abstract, the advantage of having only one responsible supervision over buildings is undisputed; but much of the overlapping and friction might be avoided if the jurisdiction of each of the officials covered the same area, instead of, as now, interfering with each other. It is very objectionable that a man who erects a building in one district should be amenable to the control of an authority in an adjoining and overlapping area. Till these areas are readjusted and made conterminous, the evils that are complained of will remain. The whole question of unification of building supervision in the Metropolis will have before long to be considered, and is one of immediate concern to the profession. The Building Act of London, comprehensive as it is, is complex as a piece of legislation;—many of the provisions allow of different interpretations, and are unquestionably too meddlesome and interfering with owners' rights when administered without discretion.

## MODEL SPECIFICATIONS.—XLIX.

## ZINC WORKER—COPPERSMITH.

ZINC is much used as a roof-covering, and is lighter and cheaper than lead. The method of laying zinc sheets is similar: the sheets are about 6ft., 7ft., and 8ft. long by 2ft. 8in. and 3ft. wide. The best known zinc is that from the mines of the Vieille Montagne Company, supplied by Messrs. F. Braby and Co. Iron, lime, or copper should never be placed in contact with zinc, as the moisture creates a destructive action, and sea air is injurious. Zinc should be laid on deal, not oak, boarding, and iron nails should be avoided. Freedom for expansion and contraction is important, and soldering is to be sparingly used. The proper gauges for roofing are Nos. 14, 15, and 16: the latter is the most efficient and durable, and should be used for gutters. The edges of wall flashings, sheets projecting over gutters, and the like, should be turned or doubled to form a half-bead, so as to stiffen the edge of sheet and give a finish (see sketches); and flashings should be turned into joints 1½in. The vertical joints are made by wood fillets or rolls, about 2ft. 10½in. from centres, the sheets being turned up on each side against the rolls (see section 2). The hatched part shows the zinc clip, which is about 2in. wide, and placed about 3ft. apart. The side edges of sheets turned up are secured by the clips as shown by the doubling, without rigidly fixing the sheets. A cap of zinc is then placed over the roll, and this is secured by "fork connections," or pieces of pointed zinc 3in. along one end of which is soldered to the inner surface of cap on each side, the other point being free to engage on to the clip as the roll cap slides over. Messrs. Braby and

Co. make also saddle-pieces and stop-ends to finish the rolls.

The welt or fold joint is explained by reference to section 3, the hatched portion showing the clip, which is doubled in between the edges of the sheets shown by black lines. By this mode of connection play is left for expansion. Our general view shows these joints, position of clips, also the mode of forming the ridge by a roll-cap, the eaves, the bead of flashing against wall, &c. Upon slopes of less than one-seventh span drips should be formed, as shown in sketches at the end of each sheet. The stopped end of roll-cap is bent over with the edge of sheet (see side view). For slopes of over one-seventh the sheets may be joined by welts, or folded together at the horizontal joints.

Corrugated zinc roofs are sometimes used, the centre of ribs or corrugations being about 1ft. 3in. from centres, or a sheet 2ft. 6in. wide is made to cover three of the ribs or rafters. The zinc should be laid on boarding, and the sheets be secured by patent holding-down clips. The Vieille Montagne Co. recommend Nos. 14 and 13 zinc gauge for roof coverings and flats; Nos. 15 and 16 for gutters; Nos. 13 and 14 are used where economy is essential. All these numbers have proper corresponding weights and thicknesses. For further particulars we recommend a perusal of Messrs F. Braby's useful pamphlet.

1. *General*.—The zinc to be of the best quality, of uniform colour, free from spots, tough, malleable, and to be laid upon the best methods. No nails or solder to be used in any part. Or—

The zinc roofing to be the best malleable Vieille Montagne Co.'s sheet zinc, laid according to the method prescribed by the Company, or under their directions.

2. *Rolls and Drips*.—The wood rolls to be 1½in. by 1½in. of deal, spaced 2ft. 10½in. from centre to centre, and to be twice splayed. The drips to flats to be 2½in. deep, and 2in. deep to gutters, spaced about 7ft. 6in. apart.

(Roofs and flats are best boarded and covered with felt, which ought to be lapped at joints and tacked with copper (or clout nails) 3in. apart. McNeill's roofing felt is one of the best felts for this purpose.)

3. *Roll Cap Roofing*.—The sloped roof over shop to be laid with No. 14 (or 15) gauge zinc. The sheets to be laid between wood rolls, turned up at sides, and secured by zinc clips 2in. wide nailed to boarding 3ft. apart, passing under rolls, and turned down over the edges of sheets. The rolls to be covered by zinc roll caps secured by fork connections. The top and bottom edges of sheets to be secured by welts, and by zinc clips 2in. wide, nailed to boarding, doubled in between edges of top and bottom sheets to make a secure joint.

4. *Ridge*.—The ridge to be covered with a zinc roll cap, the edges bent round to form head, fastened by holding down fork.

5. *Flashings*.—The flashings against wall to be of No. 15 gauge zinc, stepped 1½in. into joints of brickwork, and pointed with neat cement, the lower edge being bent to form a bead over sheet, which is to be turned up 6in.

6. *Eaves*.—The eaves are to be formed as shown in detail, the lower edge of sheet to be bent to form a bead projecting over gutter, a strip of No. 16 zinc being nailed along edge of boarding to form a drip.

7. *Gutter*.—The gutters to be laid with No. 16 gauge zinc laid to a fall of 2in. in 16ft., 9in. wide, the zinc to go 10in. under boarding, the sheets to be secured by clips.

8. *Sloped Roof*.—The roof to be covered with No. 14 (18½oz.) or No. 15 (21½oz. to the square foot) best Vieille Montagne zinc, laid to a fall of 1 in 14, with wood rolls 2ft. 10½in. from centre to centre. The sheets to be jointed horizontally by welts, and the edges of sheets secured by 2in. wide zinc clips nailed to boarding, the sheets being doubled in between the clips (see sketch 3). The wood rolls to have zinc clips 2in. wide 3ft. apart passing underneath them, the ends of clips being turned down over the sheets which are turned up, thus securing them, and the rolls to be covered by zinc roll caps secured by fork connections.

9. *Verandah*.—Cover the verandah with the best malleable Vieille Montagne zinc, No. 16 gauge, to curve as shown in detail drawings, with rolls 1ft. 3in. from centres, covered with zinc roll caps, stopped ends, &c. The sheets to be secured by clips

(or welts), and with hips, and the sheets turned up 4in. against wall, with flashing finished with beaded edge, with all necessary galvanised screws to the satisfaction of architect.

10. *Roofing of Flat*.—The zinc to be of the best quality, of uniform colour, free from spots, tough, and easily bent. The flats to be boarded, and be covered with No. 16-gauge zinc in sheets 3ft. wide, with wood rolls 2ft. 10½in. to centres, laid in direction of slope, and to have a fall of not less than 1½in. in 10ft., with 2½in. drips 7ft. 5in. apart. The zinc sheets are to allow of expansion and contraction, and no soldering is to be used; but the sheets are to be secured by zinc clips, 2in. wide, 3ft. apart, passing under wood rolls, and their ends turned down over the turned-up edges of the sheets (see sketch 2), with zinc-roll capping over, and these are to be secured by fork connections. The ends of rolls to be finished with a folded saddle-piece and stop-end. All contact with iron or lead is to be avoided. Or—

The flat over kitchen to be laid with No. 15 (or No. 16) gauge sheet zinc, laid to falls, as shown in plan and section (or 2in. in 8ft.), between 1½in. double-splayed roll fillets, placed 2ft. 10½in. (centres), secured by 2in. zinc clips, 3ft. apart, and to have No. 15-gauge zinc roll-caps, secured by forked connections. The drips to be as shown, 2½in. deep, with the lower sheet turned up and overlapped with beaded edge of top sheet. The ends of rolls to have saddle-pieces and stopped ends. Turn up zinc against wall 4in., with beaded flushing over, of No. 14-gauge zinc wedged into joints and pointed in cement. The ridge to be covered with No. 15 gauge zinc roll cap, with both edges bent or beaded. The eaves to be well splayed, and to finish with a beaded edge over gutter.

(A plan of zinc flat, showing position of drips, rolls, and their distance apart, gutters, &c., should be supplied, with the fall, length of sheets, and other details figured or marked thereon.)

11. *Corrugated Roof*.—Cover roof with No. 15 (or 16) gauge sheet zinc, laid with corrugations (as detail), the sheets secured to rolls (15in. apart from centres) with screws with bossed sockets, and turn up 4in. against wall. All the horizontal joints to have welts (secured by zinc clips, 2in. wide, nailed to boarding, doubled in between edges of top and bottom sheets to make secure joint). The flashings to be of No. 14in. or 15in. gauge zinc, tucked into joints and pointed with cement, and the lower edge formed into a bead. The eaves to be well splayed, and the edge formed into a bead. (This Italian corrugated zinc roof is suitable only for roofs of good pitch; sometimes there is no boarding, but the rafters are spaced and rounded at their upper edge to make the corrugations. But boarded roofs are better for zinc roofs, and may be felted.)

12. *R. W. Pipes*.—The R. W. pipes to be 3in. (or 3½in.) diameter, with all required bends, heads, shoes, and to be of No. 15 gauge zinc.

13. *Zinc Cistern*.—The cistern to be lined with No. 14 (or 16) gauge sheet zinc, soldered at angles, and the upper edges tacked with zinc nails, with outlets and pipe connections. (Zinc is only used for such purposes in inferior work.)

14. *Gutters*.—The gutters to be of No. 15 gauge zinc, 3½ (or 5in.) moulded, fixed with stays, every 1ft. 6in. apart, screwed to wood fascia, with covering plates at joints.

15. *Zinc Cupolas*.—Provide and fix on roof No. 15

gauge cupola, according to detail, on timber framing, to the architect's satisfaction, or provide p.c. sum for same.

16. *Ventilators*.—Provide and fix, of No. 14 gauge, three or more ventilators to roof of p.c. value, covered on upright face with perforated zinc.

#### COPPERSMITH.

As a roof covering copper has many advantages over lead; it is light, durable, and can easily be manipulated. Copper weighing 16oz. to the foot is said to be as good as lead weighing 6lb. to the foot, an important consideration where lightness and durability are concerned. Copper is not injuriously affected by the atmosphere, and the pleasant green colour it assumes protects the metal. Then its expansion is very little compared with lead or zinc.

For ordinary roofing, flats, and turrets, the copper should be 16oz. (or 24 B.W.G.) to the foot, and this weight is nearly equal in price to lead of 6lb. to the foot. The mode of laying is the same as for lead or zinc, the roof or flat should be boarded, and wood rolls used, about 2ft. 4in. apart, with welted horizontal joints. The caps ought to be welted on to the struts. For cupolas, flèches, ornamental finials, and features where the copper is much bent, the weight may be 24oz. to the foot. For flèches, cupolas, turrets, copper is the best covering, as it is light, and the details do not require any wooden stiffening, which is only necessary as a central support. Copper also does not "crawl down" like lead. Rolls with welted caps may be specified for cupolas; but for ornamental designs the copper may be laid in small copper tiles, embossed, fixed on the under side. Copper is rolled in sheets, 4ft. long, 2ft. and 3ft. 6in. wide; for roofs the sheets are 5ft., 6ft., 7ft., and 8ft. long and 3ft. wide.

1. *Flat Copper Roof*.—The roofs to be covered with 24 gauge copper, weighing 16oz. to the foot, laid on boarding with wood rolls 2ft. 4in. apart, with welted caps over turned on sheets. The horizontal joints to be made where shown, the sheets folded together (or with secure welts). Or—

Cover the roof of pavilion with copper sheets, 24 gauge, weighing 16oz. to the foot, on boarding with rolls, as shown in drawing, 2ft. apart, with welted caps and welted joints, stopped ends, &c., complete. Or—

Cover the roof of pavilion (or cupola) with copper tiles, 24 gauge, cut to the shape shown in drawing with embossed pattern, bent to hang in battens. The finial to be of 21 gauge copper (24oz.) shaped or moulded to design on wood support with brass screws, to the architect's satisfaction.

2. *Copper Pipes*.—Provide copper tubes for hot water 2½in. diameter of 1½lb. per foot run. The joints to be screwed couplings, with bent angles.

3. *Dowels*.—Provide and fix to all joints of masonry, where necessary, copper dowels 1in. square and

4in. (or 6in.) long, the ends tailed into stones and run with oil cement.

4. *Verandah*.—Lay verandah roof with 18oz. (or 20oz.) copper, according to detail, with rolls, 1ft. 9in. apart, with welged caps, stopped ends, &c., with all nails and seams and moulded gutter to architect's approval. The sheets to be turned up against wall 4in., with flushings finished with welged edge. The eaves to be well rounded off.

#### THE CANTILEVER BRIDGE: ITS DESIGN AND CONSTRUCTION.—VII.

IN addition to interesting all, and we trust instructing some, of our readers in our present series of articles, we have a third object in view. It is that of describing and illustrating, so far as the space at our command permits, some of the principal bridges erected both at home and abroad, upon the cantilever principle, so that it may become apparent how that particular type of construction has been prominently developed during very recent years. While adhering to theory, the student and beginner must pay equal, if not more, attention to practice. It is not sufficient to be able to delineate on paper a fairly proportioned and pleasing design, and to accurately estimate and calculate the amount of the different stresses upon the various members of it. Something more is wanted, and that is a practical acquaintance with the building up or putting together structures of iron and steel. It is of little or no use to determine the stresses upon the different parts of a girder or truss, if the connection and mode of attachment of the one part to another is not arranged *secundum artem*. No beam, girder, or truss, to whatever type of design it may belong, whether simple or compound, is stronger than its weakest part. This is a constructive axiom, and that it is one which is frequently neglected is abundantly testified to by the failures which have repeatedly occurred, in which the bridges or other examples did not give way, as they should have done, *en masse*, but finally collapsed by the successive yielding and fracture of individual members. Indeed, failures of this description would probably take place much oftener than they do were it not for the large working factor of safety employed by engineers. This factor is very properly insisted upon by all Government officials and local authorities charged with the supervision of all architectural and engineering works the use of which involves the safety of the lives and limbs of the public.

A skeleton elevation is given in Fig. 1 of a new cantilever bridge spanning the Danube, and connecting the old town of Buda, situated on its right bank, with its modern neighbour, Pesth, on the left. It is a road-bridge, consisting of three spans, viz., a pair of side or anchor arms, and a central span, which is composed of two cantilever arms and an independent middle girder. Each of the side spans is 260ft. in length. The cantilever arms project 211ft. from their supports over the piers, and the middle girder is 155ft. between its bearings at A and B, making a total length of 1,100ft. The general construction of the bridge is given in the cross-sectional sketch in Fig. 2, over one of the piers. There is a roadway 35ft. wide, and two footpaths 13ft. each in width. These latter are carried out from the main girders on short cantilevers, which are connected with them and also with the trallis cross-girders supporting the roadway. The uprights forming the piers are braced together for their total height, but a small part only is shown in Fig. 2, sufficient to indicate the method adopted. Over the piers both the cantilever and anchor arms are fixed, but the latter are free to move on a roller bed-plate at its bearing on the abutments. Though unquestionably the cantilever principle attains its maximum value when utilised for large spans, yet it is not so uneconomical a type for bridges of more moderate dimensions, as is generally stated. In the example under notice the centre span does not exceed 580ft., which in these days of gigantic structures of this description, such as the Forth Bridge, is by no means an excessive measurement. Steel arches, few in number, it must be admitted, have been erected with spans exceeding 580ft., and the limit for the maximum span of the ordinary bowstring and horizontal lattice girders built of the same material is put at from 700ft. to 800ft. When, however, spans of 1,600ft. and 1,700ft. are reached, the suspension principle is the only rival to be feared by the cantilever. It is certain

that in the competition between America and England as to which country should possess the longest-span bridge, the race will be between these two types.

The design represented in Fig. 3 is a half-elevation of the cantilever bridge erected over the river near the Falls of Niagara, and may be regarded as a typical form for estimating and calculating the various stresses to which the different members of the structure are subjected. This truss has a central span of 390ft., which includes a pair of cantilever arms, each 175ft. in length, and an intermediate independent girder 120ft. long. The anchor arms have a length of 195ft. each, and the total length is equal to 910ft., which allows a width of pier equal to 25ft., which is consequently the dimension of the panel over

two arms over the pier are not connected by diagonal or bracing of any other kind, no shearing-stress can be transferred from one arm to the other. At the same time, the vertical members near the ends of the arms A B and C C, over the pier, are strengthened at their intersection with the long diagonal ties by the horizontal and inclined struts shown in the figure. It is obvious that the anchor and cantilever spans, regarded apart from the central girder or truss, forming in reality a double cantilever, bears a very considerable resemblance to an ordinary swing-bridge when it is closed. For, as the double cantilever may be supported at one point located over the centre of the pier, or upon two, as in the example in Fig. 3, so may a swing-bridge. It may rest upon the turn-table, which in its turn is supported upon a central pivot. This is termed the centre-bearing method, and is chiefly used for bridges of comparatively short spans, and consequently commensurate light loads and weight.

This arrangement is represented in Fig. 4, and clearly indicates that a centre bearing swing-bridge is a continuous truss or girder, more frequently the latter, since the plate girder is a simple and economical type for bridges of this description when of moderate span. The second method is shown in Fig. 5, and is much more frequently employed than the other, and is known as the rim-bearing method, and in which the turntable rests upon a number of wheels which permit of it turning freely upon the pier. Rim-bearing swing-bridges, as will be seen from the illustration, are properly bridges of three spans, and are always treated as such. There is one point of difference which exists between the central pivot and the rim-bearing systems which requires notice. In the former the trusses must be continuous, that is, braced together over the pier. In the latter, they may be wholly, partially, or completely non-continuous. So far, therefore, as the central pivot or central bearing is concerned, the necessity of continuity constitutes another valid and excellent reason for employing the plate-type of girder, as its continuity is irreplaceable. The central pivot belonging to the first arrangement may turn in a socket, or may rest upon bevelled rollers or plain balls. In the other method the balls and rollers are replaced by wheels. When a rim-bearing continuous truss is employed, the diagonal braces over the pier—that is, the braces in the central panel—must be made of a suitably heavy sectional area, in order to insure perfect continuity throughout the whole structure.

A double trussed continuous cantilever, swinging on a centre-bearing pivot, is shown in skeleton elevation in Fig. 4, in which both of the panels on each side of the central pier are braced together by diagonal compression and tension members. If the ends of the double truss A C do not rest or bear upon the supports at A and C, there will manifestly be no reactions at those points—that is, at the abutments. The analogy existing between this example of a swing-bridge and the anchor-span and cantilever arm of a true three-span cantilever bridge is at once apparent.

Let A B be taken to represent the anchor span, and B C the cantilever arm, of any one of the different elevations we have given of that particular type of bridge. Suppose a heavy rolling load—a train, for example—advances on the anchor-span A B. It will cause the arm A B to gradually deflect, until at last the end A is brought to its bearing on the support at that point, and the positive or downward pressure is resisted and nullified by the upward reaction of the left-handed support. The deflection of the left half of the double truss or the anchor-arm lifts up, or tends to lift up, the right-handed half of the truss, or the cantilever arm B C, which, therefore, has no reaction. When the moving load has advanced so far as to be uniformly distributed over both arms, or to cover the whole truss, there may or may not be any reactions at either A and C, or at both, according to whether the half trusses are equal in span and weight. Let M equal the moment of the half-truss A B and M<sub>1</sub> that of B C over the central support B. If there are no reactions, then we have the general equation—

$$M = M_1 \dots \dots \dots (1)$$

In that case the two half-spans, or the anchor and cantilever arms, balance each other. When a swing-bridge fulfils these conditions, American engineers term it "a tipper."

The example in Fig. 5 represents a diagrammatical elevation of a continuous swing-truss or

the pier. It will be seen that the double cantilevers are supported on the pier at two points, instead of being fixed together at one point over it. It should be noticed that there is no bracing introduced over the piers between the end verticals of the anchor and cantilever arms respectively, and the arms are, therefore, free to turn to a limited extent at these points, as if they were centred on a single pivot. We shall subsequently compare the two cases of cantilever bridges being supported at one and at two points over the piers, for the subject is an important one, and does not usually receive the proper amount of consideration due to it. Viewed from this standard, the whole bridge may be considered to consist of three separate parts, comprising two double cantilever arms and the central independent girder. Only half of the elevation of the truss is shown in Fig. 3, as the loading, both dead and live, will be assumed to be uniformly distributed per linear unit over the entire structure, which carries a double railway track. In computing the stresses, therefore, the three parts—which are the anchor and the cantilever spans and the middle girder—may be treated separately. It is immaterial with which we commence, though, from the fact that the whole of the load, both dead and live, carried by the central truss is transferred to the ends of the cantilever arms, it is usual to calculate the strength of the independent girder first.

It must be remembered that as the ends of the

double cantilever span belonging to the rim-bearing type. The method of calculating the reactions of cantilever girders of this description was fully treated of in our last article. Particular attention should be given to the manner in which the reactions and stresses are affected, accordingly as one of two supports are given to the truss over the central pier. Let  $R_1$ ,  $R_2$ , and  $R_3$  be the reactions at the supports A, B, and C in Fig. 4, and  $R_4$ ,  $R_5$ ,  $R_6$ , and  $R_7$  equal those at the points A, B, C, and D in Fig. 5. In making a comparison between the two examples under similar conditions with respect to loading, we always have  $R_1 = R_4$ . From this identity it follows that the stresses upon the different members of the anchor arms are the same whichever principle of bearing be adopted. With respect to the reactions at the central support, it is evident that the separate loads transmitted to it at B and C in Fig. 5 might be replaced by a single load acting through the centre of gravity of the pier, exactly as occurs in the design in Fig. 4. The one case, so far as these reactions alone at the central pier are regarded, become practically the same as the other, and we obtain the following relation—

$$R_2 = (R_5 + R_6) \dots \dots \dots (2)$$

A partially continuous cantilever truss is one in which the diagonal bracing in the central panel over the pier is omitted, as in the Niagara bridge in Fig. 3. While the horizontal chords of the central panel are subjected to longitudinal stresses, no shearing stresses can be conveyed by them from one arm to the other. Swing-bridges have been constructed in which a combination of the two principles has been adopted, which causes them to be partly centre-bearing and partly rim-bearing. The assumption already made in equation (2) holds good for determining the stresses on the structure due to the live load, and very much facilitates the calculation of them, which is otherwise a difficult, troublesome, and sometimes not a very accurate or certain operation. If it were required to make the anchor span and the cantilever arm completely non-continuous, it would be necessary to cut away the upper and lower chords over the pier, remove the central panel altogether, and tie back each arm to the intermediate pier. A rolling or drawbridge, consisting of a couple of spans which are each projected out over a river or other obstacle until they meet in the middle of it, is another application of the cantilever principle which has been lately introduced in some designs for roofs.

It is almost universally received as a general axiom that the cantilever principle is not suitable for bridges of small spans, or, at any rate, what are now regarded as small spans. No doubt, in instances in which the ratio of the dead to the live load is comparatively limited, the statement is true to a great extent. The central span of the Niagara bridge does not exceed 470ft., which sounds very small when contrasted with the 1,750ft. spans of the Forth Bridge. But cantilever bridges have been quite recently erected with central spans of dimensions considerably less than that of the bridge at Niagara, as the following examples will point out. Among the dozen main-road bridges occurring at intervals along the course of the Manchester Ship Canal, there are two—one at Warburton and the other at Latchford—which were originally intended to be swing-bridges. Subsequently Parliamentary powers were obtained to carry the roads over the canal on embankments and high-level fixed bridges with a headway of 75ft. Both these structures are of the Forth Bridge cantilever type, and have central spans of only 206ft., and side spans of 58ft. each. The roadway is 18ft. in width, with two footpaths 3ft. 6in. broad. After the cantilever arms had been built out from each side, the central independent girder, 90ft. in length, was hoisted bodily into its place. In this case, no temporary or false works were required, although 780 tons of steel were used in each bridge. The computation of the actual stresses upon the different members of a cantilever bridge now claims our attention, as well as the determination of their respective net sectional area, or quantity of metal.

Mr. Langton Coke, C.E., one of the Local Government Board inspectors, held an inquiry on Friday at Burton-on-Trent respecting an application of the corporation for sanction to borrow £25,000 for gasworks extensions and public library and isolation hospital purposes.

## IRON CONSTRUCTION IN DRAINAGE WORK.—VI.\*

By T. E. COLEMAN, F.S.I.

SOIL, waste, and ventilating pipes of cast iron are extensively used. Each length of pipe should be thoroughly examined before being fixed, and all castings exhibiting an uneven thickness of metal or any other defect at once rejected. The sockets must be sufficiently strong to allow of proper caulked lead or rust cement joints being made.

Figs. 80 and 81 show the elevation and section

Fig. 80.

Fig. 81.

of portion of an ordinary cast-iron soil-pipe. The socket is designed with small astragals or beads cast thereon, so as to add to the strength and appearance of the pipe at this point. The spigot end is finished with a small bead to prevent the chance entry of any portion of the jointing material into the interior of the pipe. They should be well protected with some suitable preservative in order to prevent corrosion. Pipes which have been coated with Dr. Angus Smith's solution, or "glass enamelled" inside are largely used; but they may also be obtained either galvanised or subjected to the "Bower-Barff" process. Before painting any pipes which have been dipped in the "Angus Smith" solution, a coating of "patent knotting" or shellac varnish must be applied so as to prevent the tar afterwards showing through and soiling the painted surfaces.

Care should be taken that only pipes of adequate thickness and weight are provided. For substantial work, the soil-pipes should be  $\frac{3}{4}$ in. or  $\frac{1}{2}$ in. thick, and weighing not less than the specified weights for such thicknesses.

The following table shows the weight per 6ft. length for cast-iron pipes having a thickness of  $\frac{1}{8}$ in.,  $\frac{3}{16}$ in., and  $\frac{1}{2}$ in. metal respectively, viz. :—

CAST-IRON SOIL, WASTE, AND VENTILATING PIPES.

Average Weight per 6ft. Length.			
Diameter.	$\frac{3}{16}$ in. metal.	$\frac{1}{2}$ in. metal.	$\frac{1}{2}$ in. metal.
2in.	26lb.	30lb.	34lb.
2½	32	36	40
3	37	42	48
3½	43	48	54
4	48	54	60
4½	54	62	70
5	60	69	80
6	72	84	96
8	—	—	120
9	—	—	140

Under the regulations of the London County Council, the minimum weight of cast-iron soil-pipes per 6ft. length must be as follows—viz. :—

MINIMUM WEIGHT FOR IRON SOIL-PIPES.

Diameter.	Weight per 6ft. Length.
3½ inches	48lb.
4 "	54lb.
5 "	69lb.
6 "	84lb.

By comparison with the weights given in the previous table, it will be observed that a thickness of not less than  $\frac{3}{16}$ in. metal is required by the County Council for all cast-iron soil-pipes.

Each length of pipe should be properly secured to the wall, and every joint run with lead and well caulked. The pipes may be obtained with or without ears for fixing. They are usually fixed in 6ft. lengths, but are also obtainable in lengths of 3ft., 4ft., and 5ft. to suit varying requirements.

All iron pipes should be kept about 1½in. or 2in. from the walls, so as to allow sufficient room for making the joints, and also for the thorough scraping and painting of the entire surface at

\* All rights reserved.

any time. When pipes with ears cast on are used they may be "blocked" from the wall, as shown in Fig. 82. Each nail is arranged to pass through a "blocking-piece" consisting of a short length

Fig. 82.

of wrought-iron pipe about  $\frac{1}{2}$ in. diameter and 2in. long. The nails or spikes must be 6in. or 7in. long, so as to become firmly attached to the wall. Hard-wood blocking-pieces are occasionally used, but are not so serviceable.

Fig. 83 illustrates another method, in which

Fig. 83.

a "bridging piece" is fixed to the wall to receive the pipe ears, the whole being then bolted together.

Pipes without ears may be similarly secured by means of "holder-bats" or "ear-bands." These are made in a great variety of ornamental designs. Figs. 84 and 85 show two forms of holder-bat with ends adapted for building in or nailing to

Fig. 84.

Fig. 85.

walls. The pins or bolts of the holder-bats should be of gunmetal, to avoid rusting.

The bend at the foot of a soil-pipe should have a stout "duck's-foot" or "heel-rest" cast thereon, in order to obtain a firm bearing at its base. Fig. 86 is a sketch of the ordinary quadrant bend with heel-rest; whilst Fig. 87

Fig. 86.

Fig. 87.

shows a type of bend suitable for drains laid to a rapid fall.

The upper end of the soil-pipe must be carried above the eaves of the roof, and placed well away from any windows or ventilation openings. Bends or offsets should be avoided if possible; but if absolutely necessary, any change of direction should be gradual and without sharp angles. Fig. 88 illustrated a "swan-neck" or double bend with an easy curve. When the pipes are blocked from the walls, the projections of an

ordinary stringcourse or plinth can be easily passed without using bends or cutting away the masonry.

Sometimes the local conditions will not permit the upper end of the ventilating-pipe being carried vertically above the eaves, but necessitates it passing round the eaves gutter by means

Fig. 90.

Fig. 88.

Fig. 89.

Fig. 94.

of a bend known as a "roof siphon" (Fig. 89), and afterwards following the slope of the roof. Such bends should not be used except in extreme cases, as they greatly retard the passage of air-currents, and consequently prevent efficient ventilation. For buildings with overhanging eaves, the pipe should be carried directly through

shows the closet branches connected to the main soil-pipe with left-hand junctions of a similar description. They may also be obtained with an access-door at each bend or junction if required.

Fig. 93.

Fig. 95.

Fig. 92.

A right hand single junction fitted with access-door is seen in Fig. 92. The internal face of the cover is designed to continue the circular section of the pipe (see Fig. 93), being firmly secured in position with brass bolts and nuts.

The connection between a lead anti-siphonage

Fig. 96.

pipe and the upper end of an iron soil-pipe may be formed with an "inverted branch" similar to Fig. 94. A brass ferrule is firmly leaded into the socket or faucet of the branch, and a wiped solder joint made between the ferrule and the lead pipe.

When pipes or shafts are required for ventilation

Fig. 97.

only, and are directly connected to "dumb" branch drains for this purpose, so that the interior of the drain and pipe is not kept clear by the constant passage of sewage or water, the foot of the

vertical shaft should be arranged with a cavity or "pocket," into which any falling rust-scales may collect, and thus prevent any blocking-up of the air-way. An arrangement similar to that shown in Fig. 95 is sometimes adopted. An access door may also be provided near the rust pocket for convenience in removing any accumulated rust.

The usual method of connecting water-closets with a cast-iron soil-pipe is seen in Fig. 91. The closets are each joined to a lead branch which is carried through the wall and connected on the

Fig. 97A.

outside of the building to the short-arm or junction of the iron soil-pipe. The joint between the lead branch and iron pipe is made by means of a brass ferrule, as shown in Fig. 96. One end of the ferrule is passed over the lead pipe and soldered thereto, the other end being inserted in the socket of the iron pipe, and the joint made with molten lead and caulked. The connection between a lead branch and the socket of a stone-ware pipe is similarly made by means of a brass ferrule (see Fig. 97), except that the annular space is run with Portland cement instead of lead.

When the closet outlet is of earthenware, the connection between the lead branch and earthenware outlet is made with a brass thimble or socket, as in Fig. 97 A. The end of the thimble is soldered to the lead pipe, the earthenware outlet being then fitted into the brass socket and the joint run with neat Portland cement. In some cases a specially prepared bituminous composition

Fig. 98.

Fig. 99.

is substituted for the Portland cement just mentioned.

Instead of the lead branch and iron soil-pipe being connected outside the house (as illustrated in Fig. 91), the branch of the iron soil-pipe may be carried through the wall and a brass ferrule joint made within the building. The former construction is, however preferable, inasmuch that when the connection between the lead and iron is placed outside the habitation, the danger to health from a defective joint at this point is minimised.

Another method which is also adopted consists in connecting the external soil-pipe directly to the closet outlet by means of a special-made junction having a long arm provided with a stout socket. Figs. 98 and 99 are sketches showing branches of this description, as arranged for

Fig. 91.

the eaves, making good the roof round the pipe with lead flashings.

The junctions of all branches with the main soil-pipe should be formed with a slight curve in the direction of the flow, instead of with the ordinary straight arm. Fig. 90 is a sketch of a double junction with curved arms, whilst Fig. 91

closets with P and S outlets respectively. They can be obtained with arms varying from 12in. to 36in. long. Where longer branches are required, one or more lengths of iron pipe are connected thereto (as indicated by the dotted lines in Fig. 98), with caulked lead joints.

The joint between an earthenware closet outlet

FIG. 100.

and the iron pipe is made by inserting the nozzle of the outlet within the iron socket (see Fig. 100), packing a portion of the annular space with a small quantity of yarn and filling up solid with neat Portland cement.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual meeting for the distribution of prizes was held on Monday evening, when there was a large attendance of members and students. Professor GEO. AITCHISON, R.A., the President, occupied the chair, and announced that a number of valuable architectural volumes had been bequeathed to the Institute library by the late Professor T. Hayter Lewis, whose executors had also kindly lent for exhibition that evening a number of pencil and polychromatic sketches and drawings, which would be of interest to present-day students, as illustrating what excellent work was executed more than sixty years ago. A vote of thanks was passed to Professor Hayter Lewis's executors, and the PRESIDENT, then delivered an

#### ADDRESS TO STUDENTS.

The world, he remarked, consists of the past, the present, and the future. The past is hopeless; it cannot be altered or improved: it can only be studied. The present, of which the practising architects are representatives, is too well known to dilate on; and the immediate future consists of the students, and they allow us to conjure up all sorts of visions, and to delight ourselves with fancying that their works will be stamped with the perfection that ours have missed. In an art like ours it is very difficult to know what useful experience we have to impart, because our views and those of the rising generation are probably different, if not opposed. I give you, added the President, some remarks of Professor Cockerell to the R.A. students of my day: "That they should study all styles, for they can never tell how fashion will change, and that the style they have chosen may not be abandoned." This was said when imitation Gothic was all the rage. I hope for the advancement of architecture which will take every one, and that when it does come it will not be an imitation of some dead style. At present we have no means of evoking genius, and the only means that has yet occurred to me to improve our art is by learning principles and by striving. All the sciences and arts seem to go in cycles, or, as we should say, are mounted on Fortune's wheel, and, as it turns, one art or science is at the top of the wheel while the other is in the mud, and as it goes round the positions are reversed. At the present moment, the epoch is that of the application of science, and is on the top of the wheel, while architecture is very low down. A great incentive to any study or achievement is that of being thought highly of by your contemporaries, though there is a higher stimulus in the hope of that sort of immortality which

mortals can attain. One of these inducements at the present time is impossible to be looked for—the admiration of your fellow-men; for who knows or cares whether your work is good, bad, or indifferent, except, perhaps, a brother architect? The present age is, indeed, indifferent to architecture, so that you cannot expect much honour or reverence on account of your work, or that it will cause much pleasure or delight to the living beholders. It becomes questionable whether there is enough stimulant to attract men who possess the intellectual faculties necessary for producing fine architecture, such as will be admired for two or three thousand years. To be a great architect involves a capacity for acquiring the higher branches of mathematics and be able to use them; to comprehend, at least, statics, and even to advance beyond the point at which it has then arrived; to so arrange a building as not only to fit it for its purpose, but to put it in a shape that will command the admiration of skilled and cultivated beholders, and to invest the finished structure with a capability of exciting emotions that are proper to its use. Architecturally this is brought about by simplicity, perfection of proportion, by outline, by the proper disposition of light and shade, and by size and mass. To the former qualifications of the architect must be added the capacity of knowing what additional interest can be given to important parts by sculpture, and how colour can be properly applied to the whole structure. Of course it would be infinitely better for the architect to possess the whole of these qualifications; I do not know whether this was ever the case, though Sir Christopher Wren very closely approached it. We know that in whatever excellent qualities the Renaissance architects were deficient, they were mostly sculptors or painters. Where they were deficient was in construction, in invention, and in the proper expression of their buildings. All of us desire to see architecture progress, more especially in æsthetic expression. Since the application to building of cast iron, wrought iron, and steel, the engineers have surpassed even the wildest imagination of sixty years ago. The Britannia Tubular Bridge is about 500ft. span, but Sir Benjamin Baker has made a span of the Forth Bridge over 1,700ft. It is very unlikely that any architectural work would require a span of more than a tenth of that bearing, and that supposes an extension of more than double the span of the largest groined vault of the Romans, which was only about 80ft. Still, we must to a certain extent look for the advancement of architecture in a nicer adjustment of the mass to its height and to the weight to be carried, and to the form to be given to the supports for the weights and strains that come on each particular piece. In the use of iron and steel architects are very much handicapped, first on account of the slenderness of proportion which, as a rule, renders them unfit to compose with the weaker material, but mainly on account of the little resistance these materials offer to the action of fire, unless they are protected by fireclay and terracotta; and when they are so protected they very nearly assimilate in size to the supports of old-world structures. Still, if the Mediæval architects had possessed these materials and been able to work them as we can, they certainly would not have abstained from using them, as architects of the present day have mostly done. What visions does the use of cast iron raise in our minds as to the possible size and height of buildings? What new forms and shapes does not cast iron suggest when we know that it will take any form we please and any ornaments that can be cast? What visions of colour does it not evoke when it may be made resplendent with enamel? No one can say that convenience in planning is not greatly studied in the present day, but this convenience has mostly been of the purest utilitarian sort: it has been a question of how the accommodation wanted can be packed anyhow, which should not be the aim of architectural planning, which now, alas! is hardly thought of. The other thing to be aimed at is to give expression to the thoughts, cultivation, and aspirations of the present day, a subject that requires the deepest study and a perspicacity that is rare. We have ransacked all the civilised architecture of the past and made collections of it for use; but we have certainly not applied the examples with discretion. The delicate ornaments and suggestive sculpture that were applied to the embellishment of the boudoirs and pleasure-houses of Renaissance beauties are now lavished on oyster-shops, public-houses, and clothiers' warehouses, and the magnificence and

stateliness of the palaces of great nobles now deck stores or hotels. The President added that, although he did not think that the test of examination was a very complete one, it was better than nothing; but yet the profession generally thought even this too much, and utterly declined to start a more complete one for Fellows, being afraid that a knowledge of the elements of architecture might damp the ardour of genius or clip its wings; while almost all the other professions had examinations for the two classes, and had consequently advanced at a much more rapid rate. There were two points to which he would draw particular attention—first, that architecture was a structural art, and that all an architect could do, as an architect, was to build: in his structures he had to show his knowledge, taste, and skill, his learning, morals, cultivation, and aspirations. Secondly, he would point out the comparative scarcity of the use of coloured and glazed materials for external facings where the greatest beauty of colour and form might be used. It was refreshing even to think of London and other manufacturing towns presenting beautifully coloured fronts that did not want painting every year, and would render such towns cheerful, if not delightful, to look on, in the place of the dingy, sooty, and depressing houses faced with stone, brick, or plaster; and this would not only raise our spirits, but be more healthful, for glazed pottery absorbed but little moisture, and was easily cleansed from dust and soot. In conclusion, the President expressed his pleasure that ladies had been admitted to the Associateship (an allusion received with hearty cheering), for that allowed us to avail ourselves of the abilities of at least another half of the population, and as well as to offer a small meed of justice to the fair sex.

#### REVIEW OF THE WORKS SUBMITTED FOR PRIZES AND STUDENTSHIPS.

Mr. BERESFORD PITE gave an address on the competition designs and drawings submitted this year, in which he observed that the designs showed a manifest desire to return to Classic tradition, to the standards of design in mass and detail that were current before the Romanism of the Gothic and Queen Anne revivals coloured the dreams of old and young architects alike. But he feared that the paltry recognition of the force of tradition, which had been transgressed with impunity, suggested a confession of failure and a lack of hope and energy in imaginative effort. This pessimistic attitude was indicated by the designs submitted for a concert-hall in the Soane competition. The premiated set submitted by "Ben Marcato" (Mr. Mellon) were severely criticised by Mr. Pite, both from a constructional and æsthetic point of view; some details were characterised as symptoms of that road to architectural ruin which once led from Regent-street to Regent's Park. Other designs returned to the traditional Classic style, with traces of a freer influence as to detail and composition; but in almost every case without a sufficient sense of symmetrical propriety or of dignity of proportion. The Tite prize was won by "Red Rose," with a design modest and even small in size, but illustrated by powerful drawings, and very doubtful as to the Italian character of its style. He thought the design "Memoria" was the best submitted this year in this competition. In the Grissell Medal competition for a fruit market for a small town, the successful design by "Simplex" possessed, in addition to its constructional faces, some architectural appropriateness. It was to be regretted that the design by "Artichoke," which had a very pleasant and English idea of the subject, should be without sufficient constructive quality. The Silver Medal had been awarded in a way that would indicate to students the vast importance of having a fine subject: the north porch of St. Paul's lent itself admirably to fine draughtsmanship, and this, with fine design, were, Mr. Pite thought, irresistible at the Institute. For the Pugin Studentship there had been a remarkably good competition this year; it was awarded to an omnibus collection of Gothic studies, mostly English—glass, decorated screens, inked-in sketches, and measured drawings. For the Owen-Jones competition an excellent set of archaeological studies had been sent in, comprising mosaics of the Capella Palatina, drawings of S. Maria, Miracoli, S. Anastasia, Verona, and of some screen-work at Southwold. The colour was archaic, the mosaic and pavement design was interesting, the fresco hangings were faded, the

stained glass colour needed the light, and the heraldic colour had other meanings. The Owen-Jones Studentship was, he reminded students (and, incidentally, the Council), for the study of colour, not merely for the accidentals of a pavement and stained-glass competition.

Mr. H. H. STATHAM followed with some observations on the planning of concert-rooms, with primary reference to the Soane Medallion.

The PRESIDENT then proceeded to distribute the prizes and medals in accordance with the list published by us last week (p. 86), remarking that the Soane Medallion had been awarded by the Council to the design by Mr. W. A. Mellon, as being in their judgment the best of those submitted, notwithstanding that it admittedly contravened some provisions of the London Building Act.

At the close, a student, understood to be one of the signatories to a memorial of protest against the Soane award sent to the Council, rose and asked if the conditions for future competitions for the Soane Medallion were to be prescribed by the Council or whether students might design as they pleased. The PRESIDENT declared the proceedings closed, adding that next year's printed programme would afford all the information competitors might require.

#### THE SOANE MEDALLION AWARD AT THE INSTITUTE.

FOR some reason or other all the designs in the Soane Medallion competition were exceedingly indifferent—so much so, that we expressed the opinion, after examining the drawings, before the prize was awarded, that neither of them deserved the Medallion. So poor indeed did we consider the selected design, that we did not think it worth while to ask the author for the loan of his drawings for illustration in the BUILDING NEWS. It is no surprise to us, therefore, that a large number of students and others connected with the Royal Institute of British Architects have memorialised the Council to reconsider the adoption of the Committee's report. Of course, after the presentation at the meeting on Monday last, and Professor Aitchison's clever avoidance of any discussion, this is no longer possible, but it ought to have been. The mistake made by the memorialists was that they did not get someone to bring forward the question before the proceedings commenced. As it was, no one rose till after the President had concluded his address, and the business of the evening was practically over. This was unfortunate, and particularly so as some recent public competitions, in which the referees were nominated by the Council, have been unsatisfactory enough in all conscience, and if any confidence in the judgment of the leading authority at Conduit-street is to obtain with the profession and the public, as it undoubtedly should do, mistakes of the kind described so clearly by the memorialists ought not to have been ratified. It is unfortunate enough that so palpable an error of judgment should even so far have been possible as to recommend such an award.

The following is the text of the document, which is signed by sixty-five names, some of which are well known by the merit of their work among students:—

[COPY.]

To the Council of the Royal Institute of British Architects.

We, the undersigned, wish hereby to lodge a formal appeal with the Council against the decision of the Prize Committee in the recent award of the Soane Medallion, with a view to obtaining a reconsideration of the above decision and a scrutiny into the various points hereinafter enumerated.

The appeal is made principally on the ground that the successful Competitor has failed to comply with the Rule as stated in the Studentships and Prizes Pamphlet—namely, that "The Regulations of the London County Council should be observed."

An attempt has been made to enumerate some of the Regulations which he has neglected to observe.

At the end are added a few points, apart from the violation of these regulations.

#### EXTRACTS FROM LONDON BUILDING ACTS.

#### NOTES ON THE PRIZE DRAWINGS FOR THE SOANE MEDALLION.

1. Dressing-rooms shall be arranged in a separate block of buildings, or divided from the place of public resort by party-walls, with only such means of communication therewith as may be approved by the Council.

No separate blocks of buildings. No party-walls. Only  $\frac{1}{2}$  in. partition shown.

2. Sufficient and separate water closet and urinal accommodation, properly ventilated to the outer air, shall be provided for the use of male and female artists.

3. Two separate exits, not leading into the same thoroughfare or way, shall be provided to every tier or floor of such premises, also a separate means of exit shall be provided—communicating directly with the street—from each floor or level.

4. Such exits shall be arranged so as to afford a ready means of egress from both sides of each tier or floor, and shall lead directly into a thoroughfare or way.

5. Every staircase for use of audiences shall have treads not less than 11 in. wide, and risers not more than 6 in. high.

6. Every staircase shall be without winders.

7. Every staircase, landing, lobby, corridor, or passage intended for the use of not more than 400 persons of the audience shall not be less than 4 ft. 6 in. wide; but if communicating with any portion of the house intended for accommodation of a larger number than 400 persons, it shall be 6 in. wider for every 100 persons until a maximum width of 9 ft. is obtained.

8. No staircase shall have more than two flights of 12 steps, each without a turn.

9. No staircase shall have more than 12 steps in a flight or less than three.

10. All landings shall be 6 in. thick, and squared on plan.

11. Several flights of steps shall be supported and inclosed upon all sides in brick walls not less than 9 in. thick, to be carried down to the level of the footings.

12. A clear passage or gangway not less than 3 ft. wide shall be formed at the sides and in the rear of the seating in every part of such premises; such passages or gangways shall at all times be kept free from chairs, flaps, seats, or other obstructions, whether permanent or otherwise.

13. All internal doors shall be so hung as not to obstruct when open the gangway passage staircase or landing.

14. No door shall open immediately upon a flight of steps, but a square landing at least the width of the doorway shall be provided between such steps and such doorway.

15. Every person who shall hereafter construct a water-closet in connection with a building shall construct such water-closet in such a position that one of its sides at the least shall be an external wall, and shall construct in one of the walls of such water-closet a window of such dimensions that the area of not less than 2 sq. ft. shall open directly into the external air.

16. All doorways used by the public shall be at least 4 ft. 6 in. wide in the clear, with doors hung in two folds, made to open outwards towards the thoroughfare or way.

17. Highest part of pit, or of the stalls where no pit, shall not be more than 6 in. above the level of the street adjoining principal entrance to the pit, nor lowest part of floor than 15 ft. below.

18. Dressing-rooms to have independent exits leading directly into thoroughfare.

No w.c.'s so ventilated (six on ground floor, two on first floor).

First floor has only one exit into vestibule, but uses all four gallery staircases, none of which therefore are separate staircases.

Query?

All gallery stairs and artists' stairs have less than 11 in. treads.

Grand staircase has winders from half-landing upwards.

Ground-floor corridor 8 ft. wide, and should be 9 ft. for 1,340 persons.

Grand staircase has 15 steps in flight. Gallery staircases have four flights of 15 steps each, and two flights of 16 steps each.

There is one exit staircase on each side of the building with landings not square on plan.

There is not a single instance of stairs used by the public so supported or inclosed.

On ground floor there is no gangway either at the sides or in the rear of the seating. The first floor, chorus, and upper gallery have no gangways in the rear of the seating.

Doors opening on to the gallery stairs obstruct the landings. Doors from stalls obstruct free egress. Doors obstruct promenade at the rear of the building.

The two central side exits on ground floor have doorways 6 in. wide, and the landing they open on to is only 3 ft. 9 in. wide.

There are 11 closets on ground floor not against external walls, also 1 closet in gallery. There are 19 closets on ground floor without windows, 6 on first floor, 3 in gallery.

The doorways on street level of the four-gallery staircases are about 4 ft. 6 in. wide. This is not wide enough for the number of people for which these stairs are intended—vide paragraphs 3 and 7.

Gallery doors opening on to exit stairs are only 3 ft. 6 in. wide and hung in one part.

The floor of the stalls is 4 ft. 6 in. above the level of the pavement.

Artists' exits are not entirely independent.

Apart from the above points under the London County Council Regulations, it may be noted that:—

1. The four central columns and the two pilasters with adjoining walling, on the side elevation, with entablature 8 ft. 6 in., and balustrade 6 ft. 6 in., also a part of the roof, are carried on girders over the corridor of ground floor, which are in turn supported by walls 2 ft. and 18 in. respectively.

2. If the water-closets had been placed next to an external wall with windows for light and ventilation, the appearance of the elevation would have been considerably altered.

3. The Royal entrance, which is smaller than and adjoins the gallery entrance, opens almost immediately on to the Royal lavatory and w.c. There is only one lavatory and w.c. for both the ladies and gentlemen of the Royal party. There is no Royal cloakroom. The Royal party could only proceed to their seats by the public staircase and down the narrow gangway between the assembled public, their seats being in the uninclosed front row of the first tier.

4. There are absolutely no pay-boxes whatever.

5. The artistes, chorus, and orchestra—310 in all—have to enter and return by a staircase, which is 2 ft. 9 in. wide in the clear.

6. In the event of fire the open-well staircases which exist throughout would be most dangerous.

There is really no answer to the specific and very pertinent criticisms of the memorialists, and for that reason the Council of the R.I.B.A. probably made up their minds that none should be given. These are old tactics at Conduit-street, and the memorialists are evidently not up to them.

#### THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the President, Mr. G. H. Fellowes Prynn, F.R.I.B.A., in the chair. Messrs. B. Crockett, L. U. Grace, C. B. G. Shepherd, E. C. Shrewsbury, Montague White, R. E. Peach, A. E. Potter, and C. C. Thompson were elected as members. Mr. E. HOWLEY SIM, Hon. Secretary, announced that the first visit of the season would take place on Saturday afternoon, Feb. 4, and would be made to Carlton Hotel, Haymarket, by permission of the architect, Mr. H. L. Florence.

#### ANCIENT AND MODERN BUILDINGS IN PALESTINE.

Under this title Mr. BERESFORD PITE, F.R.I.B.A., ex-President, gave a vivacious and interesting description of his recent visit on professional business in the Holy Land, illustrated by a large number of lantern slides from photographs taken by the lecturer. Having referred to the deep interest ever attaching to "those holy fields," Mr. Pite pointed out that many influences had affected the architecture of Palestine, including Phœnician, Assyrian, Græco-Roman, Roman, Arab, the Crusaders, and Turkish, while the modern element was not unrepresented, even to works of the Gothic Revival. The principal building material, a hard, coarse-grained limestone, had had a marked effect on the ornament employed. The best-preserved remains of antiquity were East of the Jordan, where, since the day of Mohammed the natives have not used buildings, but have dwelt in tents, and thus had no inducement to utilise old structures as quarries. The author referred also to the caves and rock tombs, and to the excavated cisterns and oil and wine presses, as characteristic features of the country. A general view of Jerusalem and a plan of the modern city were shown on the screen, and also photographs of the Gihon Valley, the Tomb and Tower of David, the Jaffa Gate, typical streets in Jerusalem, and also the chamber of the Knights of Malta and of the Holy Sepulchre, the Damascus Gate, the Ecce Homo arch, the Tower of Antonia, the Golden Gate, the Wailing Place, the Church of the Virgin, and the famous Dome of the Rock, of which three or four views were exhibited. Other views followed, including Gethesemane, the village of Siloam, the Convent of Mar Saba, and the port of Jaffa depicted from the sea. Turning to modern Jerusalem, Mr. Pite alluded to the rapid growth and development of the city, which, he remarked, was being rapidly modernised. The water supply was obtained from cisterns in which rain-water was stored in the absence of living water. Passing on to building matters, based on his experience in a girls' school and hospital at Jerusalem, he said a firman, defining the area and height of proposed operations, had to be obtained from the local authorities before work was commenced, and that water was supplied for the works at per skin. Walls were weather-proofed on the north and east aspects by brick linings to the masonry.

#### BUILDING PRICES IN PALESTINE.

Some interesting details were given as to the

cost of building operations, based on the lecturer's experience as architect of the new English Hospital in Jerusalem, the average amount being about 10 francs per cubic metre for foundations and cisterns, and 12 francs for work above ground. Bricks cost about 7 to 12 francs per 100, or £4 to £5 per 1,000; paving tiles 6 to 8 francs per square metre, or say £1 per square; timber 4 to 6 metres long was charged from 13 to 20 francs, or 120 francs per cubic foot, or, say, five times as much as in London. Roofing tiles from Marseilles cost 25 francs per hundred, thirty of these tiles going to a square metre; they were wired to battens, and needed re-wiring about every ten years or so. The expenditure upon lime was about one-twelfth that of the whole building, or one-fifth of the cost of walling, including plastering. For a girls' school, in which plastering was not adopted, the lime cost between one-seventh and one-eighth. Walling in masonry was reckoned for each side of a wall of eleven stones, at 1 piastre (or 2½d. sterling) each for the under side, and 2 piastres each for the outer or hewn side, that was 33 piastres altogether; time payments cost about 5 or 6 piastres, and wages and hauling a further 10 piastres, bringing the outlay to, say, 50 piastres, equivalent to 12 francs 20 centimes per square metre. Calculated at per square metre, foundation-walls cost from 10 to 11 francs, work above ground 14 to 16 francs, partitions 0·60 metres in thickness 10 francs, "dolina" walls—i.e., wooden framework filled with masonry—6 francs, ventilators 8 francs, façade stones being from 1 franc 25 cents to 1 franc 50 cents extra per square metre. External pointing cost ½ franc per square metre, corner stones and quoins 2 francs apiece, lintels and cornices 3 francs per metre run, the cost of door and window-openings being about 40 francs each. The price paid for plastering, &c., from 1½ to 2 francs per square metre; for cementing new cisterns, 3½ to 4; and for ceiling plasterings, 2 francs 50c., all at per square metre. For tile roofs, wood, labour, nails, and tiles cost 12 francs, or for heavier woodwork 15 francs, per square metre. Carpentry, &c., cost per window, glazed, painted, and fixed, 36 francs; per internal door, complete, 50 francs; per shutter pair, ditto, 40 francs; and iron bars fixed ½ franc per kilo. The girls' school at Jerusalem, including the boundary wall, gatehouse, and cistern, and the clearance of site, cost about 12 francs per cubic metre, or 4d. per cubic foot. The thickness of walling averaged 2ft. External work was known as "kallin midmak," and "laktah" one face of wrought stones, with smaller stones behind to make up the required thickness, and "misseh" or hard stones for facing. Both foreign and native bricks were used, the latter being inferior. For mortar, black earth and lime were used in equal proportions, or sand and lime, the sand being rare. Putty and white-lead were employed for external work. Pottery-dust 2in. thick was utilised as a filling in for cisterns. For ventilating "Narie," a fine porous stone, is used, and also "Akkad." The flue-pipes were built into the walls, and the roofs were tiled. Mr. Pite showed plans, elevations, and details of the new English Hospital at Jerusalem, and gave for comparison several similar institutions built by other nations in and near the Holy City, including the German and Moravian Leper Hospitals, and the Russian Hospital, all at Jerusalem, and the English Hospital at Jaffa. He also exhibited lantern-slides of the Moravian School at Bethlehem, the Russian Church a Jewish colony, and the railway started at Jerusalem, the German Church at Bethlehem, and also the French Church and Nunnery at Jerusalem.

Mr. A. E. DICKIE, architect, of Edinburgh, who has lately been conducting excavations in Jerusalem for the Palestine Exploration Fund, proposed a vote of thanks to the lecturer. This was seconded by Mr. ALEXANDER PAYNE and supported by Mr. PHENE SPIERS, F.S.A., and having been spoken to by the PRESIDENT, was carried by acclamation, and briefly acknowledged by Mr. PITE.

#### THE DESIGN FOR VAUXHALL BRIDGE.

The PRESIDENT spoke in strong terms deprecating the design recently adopted by the London County Council for the rebuilding of Vauxhall Bridge, and concluded by proposing the following resolution which had been adopted by the Committee of the Association:—

"That the Architectural Association, recognising and appreciating the efforts made by the

London County Council for the embellishment of London, views with the utmost concern the manner in which it proposes to rebuild Vauxhall Bridge, and desires to express its sense of the unfitness of the design for a work of such architectural importance."

The motion was agreed to *nem. con.*

#### THE SURVEYORS' INSTITUTION.

AT an ordinary general meeting, held on Monday evening last, a paper on "The Rating of Coal Mines" was read by Mr. E. Boyle, Q.C., who began by apologising for the unattractiveness of his subject, which was not a branch of the profession in which many surveyors were engaged. The Law Reports showed that during the last 50 years there had been but few contested cases, and not one was reported as specially decided by the High Court. This was somewhat surprising, but was due to the rough-and-ready methods generally adopted by agreement, and to the fact that collieries had formerly been under-assessed, and that in good times the amount of the assessment was not too closely criticised. The ever-growing burden of taxation compelled the assessment committees to give increased attention to such an extensive source of income, and to carefully consider the possibility of levying increased rates on an industry employing millions of capital and tens of thousands of men. Great Britain had once a practical monopoly of coal, and even in 1866 produced 60 per cent. of the world's output. In 1880 this was 40 per cent., and in 1895 had fallen to 36 per cent. The increase of output during the last 20 years had been—Great Britain, 42 per cent.; United States, 270 per cent.; and Germany, 145 per cent. Though population had increased, prices had steadily fallen. Coal had during recent years varied from 5s. to 17s. per ton at the pit's mouth, and when it was remembered that an owner thought himself fairly paid if he made 6d. per ton profit, the speculative character of the business would be apparent. Many of the most important towns in England relied on neighbouring coal for their prosperity, and even so late as 100 years ago Sussex was the chief seat of the iron trade, and, although the ore remains, there is no fuel to work it with since the oak forests have disappeared. The first iron cannon was made at Buxstead in 1543, and much of the old ironwork of London (notably the railings round St. Paul's) was of Sussex iron. Until 1874, tin, lead, and copper mines were not ratable; but coal-mines were rated under an Act 43 Eliz. cap. 2, the coal which was then worked probably lying near the surface and being cheaply got. The rent of a hereditament was usually the basis of rating; but coal-mines were seldom rented from year to year, but were let on lease, subject to the payment of a royalty beyond the rent; but as a large preliminary outlay was necessary, a lease for a long period of years was generally granted. Although the working of the mine reduced the value of the freehold, it had been decided (in "Rex v. Attwood") that mines must be ratable for what they produced—viz., the coals. Slate quarries and brick earth were also exhausted in a few years, but the rate was always put upon them. The custom of rating the "coal got" was wrong at law, for "coal got" was a chattel, and so not ratable. In some unions, gross and ratable value were taken as the same, which allowed nothing for repairs, insurance, and other expenses necessary to keep up the hereditament. One method of rating was to put a percentage on cost of shaft, and plant, to add rent and royalty, and to take the whole as the ratable value. This might possibly, but not probably, work fairly, as the author showed. If the mine were fairly rated when in full work, the rating at the beginning of the tenancy and at the end was necessarily excessive. The expense of getting the coal must of necessity differ very considerably in different mines, depending, as it did, on the depth, freedom from water, absence of heat, access, and many other considerations. Very few, if any, collieries were let on a yearly tenancy, which added to the difficulty of arriving at a fair ratable value at any given time. In the case of mines running under the sea, the workings would, of course, be only ratable as far as the parish boundary, which was the low-water line, though all within the parish would pay rates. Mr. Boyle gave instances of the several ways in which the ratable

value of coal mines might be arrived at, and came to the conclusion that the fairest way was to treat a mine as a railway or gas or water company would be dealt with—namely, on its receipts and expenditure, making due allowance for all contingencies, such as accidents or flooding, and for replacing of plant and repairs to working, &c. From a legal point of view a mine could not be assessed as could, for instance, a public-house, which was one of similar houses in a neighbourhood under similar conditions, for every mine had its own conditions, and its value depended on very much more than mere locality or the selling price of coal. The mine must be rated as exceptional properties, each on its own merit. After quoting recent decisions in support of this view, Mr. Boyle concluded by insisting on the necessity for taking into consideration every circumstance of the working of a mine in order to arrive at a just ratable value.

Letters were read from Mr. W. Wright (member of Council) and from Mr. Longden, president of the Institution of Mining Engineers. The former gave an instance of a colliery district in Notts, in which, prior to 1865, the ratable value was fixed by the overseers usually by agreement with the owners. In that year a regular valuation was made, which resulted in an arbitration, lasting for many years, the result being that a basis of 4d. per ton, on sale tonnage + 2 per cent. for coal consumed in working was agreed to. Where plant and shafts were in a different parish from the workings, it was agreed to take 3d. per ton + 2 per cent. for the working, and 1d. per ton + 2 per cent. for the plant and shaft. The rating was annually revised.

Mr. Longden said, that having been a member of an assessment committee, he could say that in most of the unions where collieries existed they were looked on as a nuisance by the farmers and tradesmen, who composed the committee, for they raised wages and made labour scarce, and they were therefore taxed as heavily as possible, as was perhaps natural in view of the enormous increase in rates of late years—in some cases from 3s. to 6s. in the pound. In most parishes where there were collieries, their ratable value was from half to one-third of the whole, and it was not until the coal was worked out that the farmers realised how much the mines had helped the rates. The general principle was to agree on a tonnage basis, unless there were exceptional circumstances. This enabled the rate to be easily calculated and collected, or, if necessary, re-adjusted. In the case of the Denaby Collieries, the rate appeared to be about 5d. per ton instead of 8d., as it seemed to have been previously. His experience was that 3d. per ton was paid for the coal, and the colliery itself, where in another parish, the remaining 1d.

A discussion followed, in which Mr. W. Eve, Mr. E. J. Castle, Q.C., Mr. R. Horsfall, and Mr. C. F. Jones took part, the speakers on the whole quite agreeing with the author's views, and after a short reply from Mr. Boyle, the meeting was adjourned. At the next meeting, on February 3, the discussion will be resumed on Mr. Weaver's paper on "The London Building Act and the Official Supervision of Buildings."

#### THE NOTTINGHAM AND COUNTY CONSTITUTIONAL CLUB.

THIS building was formally opened on the 25th inst. by the Duke and Duchess of Portland, having been about two years in course of erection. The competitive design has been practically carried out in its entirety, and includes the following accommodation:—Ladies' room, entered from the first vestibule, and divided from the club proper by an entrance screen overlooked by the porter's room; smoke-room and billiard-room for three tables, with large lantern-light over, and bar serving-room on ground floor; dining-room, with large circular oriel window and balconies, which occupies the whole of the Market-street frontage; private dining-room, committee-room, writing-room, reading- and two card-rooms, with serving-room and butler's pantry on first floor. Five members' bedrooms, stewards' rooms, secretary's office, kitchen, scullery, and servants' hall occupy the second floor; and men and maid-servants' bed- and bath-rooms the third floor. Connected with the club, but divided from same by two doors, is a large assembly hall, which has a special entrance and emergency exit into street at back, and will accommodate about 250 people. It is provided

RESIDENCES: TAMWORTH ROAD, GRAVELLY HILL, BIRMINGHAM.

with a platform in an arched recess, with ante-dressing, and ladies' and gentlemen's retiring-rooms, all so arranged as to be conveniently used in connection with the club, or independently. The main entrance-hall, 26ft. by 25ft., is large and spacious, and is well lighted with a large lantern (15ft. square) of stained glass. The main staircase, 6ft. wide, is built of yellow Mansfield stone with York stone steps. A circular oriel balcony, with carved panels and royal arms over an elliptical arch carried on Euglevik granite columns and pedestals with Ionic caps, is a feature of the hall. The hall mantel and overmantel is of mahogany, with marble arch and copper canopied dog-grate set into tile recess, the floors being in marble mosaic. Three large sets of lavatories and conveniences are provided, and a skittle-alley 50ft. long, under the entrance hall, is reached by a staircase under main stairs. The front entrance porch is panelled in black Kilkeny and Languedoc marbles, and the vestibules with mahogany dado and vestibule screens filled with stained glass and bevelled plates. The registration offices of the party are also arranged in the buildings, the basements being used for beer and wine cellar and heating apparatus. The whole of the principal rooms are heated by means of ventilating radiators, and ventilated with fresh-air inlets, the foul air being extracted by Blackman's electric ventilating fans. The frontage is built of Derbyshire stone from Darley Dale, in the Renaissance style, treated with one bold and massive gable which rises to a height of about 70ft.; the principal entrance has a carved hood supported on massive corbels. A special feature has been made with a large circular oriel window on the first-floor with balconies on each side, commanding an excellent view up and down the thoroughfare. The gable is treated with bold scrolls, and finished with a dated pediment with the Lion and Unicorn on each side, and the City arms are arranged over the oriel windows. The contractor for the foundations was Mr. W. Woodsend, and for the upper portion Mr. I. Hutchinson. The whole of the wood mantels are from the architect's designs. The architect is Mr. A. R. Calvert, F.S.I., of Nottingham, who won the work in competition, assisted by Mr. W. R. Gleave, A.R.I.B.A., who

has acted as clerk of works. The cost, including furnishing, will be from £20,000 to £30,000.

#### RESIDENCES: TAMWORTH ROAD, GRAVELLY HILL, BIRMINGHAM.

THE site is in a well wooded suburb of Birmingham, and the plan is arranged to suit a nearly triangular plot of land, with an askew building line. The scheme was arranged to afford the requisite accommodation, with a good outlook, on the limited frontage, and an equal number of rooms of as nearly corresponding size in each of the two houses as could be obtained. The external facing on ground floor is of picked common red brick, with dark red pressed bricks for arches, strings, &c. The upper story is cement, roughcast, &c., and the painting is in cream and white, with roof of red tiles. Internally, the living-rooms and parlours are wainscoted and finished in Oregon pine, the joists, &c., over hall and sitting-room being cased with same, and the stairs of same material. The floor is of oak parquetry; Anaglypta is adopted for the panelled ceilings of dining-room and den, with frieze of same substance round each. The left house is somewhat plainer in finish. The cost of erection and completion, inclusive of specially designed chimneypieces, &c., and stained glass, has been under £1,700. The architect is Mr. B. C. Hughes, and the builder Mr. John Webb, both of Birmingham.

#### THE HISTORY OF GARDENS.

MR. ALBERT FORBES SIEVEKING, F.S.A., delivered a lecture on "Gardens; their History and Literature," illustrated by limelight pictures, at the London Institution on Thursday in last week. The lecturer differentiated the formal or architect's garden (open-air extension of the house, with its clipped hedges and trees of topiarian art) from the natural, irregular, Chinese, English, or landscape garden. He then showed the design of an ancient Egyptian garden from a tomb in Thebes. The problem of the "hanging gardens" of Babylon he declared to be still in "suspension"; and

passing by the ancient Persian gardens, he showed three views of existing ones, including the Shah's gardens at Teheran. The gardens of Homer and of the philosopher Epicurus brought him to the "built" garden magnificence of the Roman Empire, to illustrate which he showed Lucullus's villa at Baia, a trellised garden from a wall-painting at Herculaneum, and the restoration of Pliny the younger's Tusculan villa from his own detailed description, and pointed out how this contained the essence of the formal style and the germ of the natural or landscape school. Of monastic gardens, he showed a plan of the Abbey of Saint Gall by a monk in the ninth century, and pictures of the monasteries of Saint Germain des Prés and of Ashridge, in Herts. Mediæval gardens were represented from the "Roman de la Rose" and the "Garden of Love," the earliest known engraving—Blois and Gaillon and St. Germain en Laye, from Ducerceau's Architecture—and De Vries's "Hortorum Formæ" to illustrate Palissy and the Potter's "Jardin Delectable." Of Early Tudor Gardens he showed the still existing "Pond Garden" at Hampton Court; and then, turning to Spain, he showed pictures of the Alcazar, the Generalife, and Aranjuez, where Velasquez painted. Italy furnished the terraced gardens of the Villas d'Este and Albani, after Piranesi's engravings and Mr. George Elgood's beautiful pictures. Of Elizabethan Gardens, he showed De Caux's Plan of Wilton (with Taylor, the water poet's euphemistic description), a plate from Crispin de Pass's "Hortus Floridus" and Sir Philip Sidney reclining in the "pleached" garden at Penshurst. Of herbals, the title-page of Gerard's first edition was shown with brief allusion to the physic gardens of Europe, De Serre's "Théâtre d'Agriculture," and Mollett's "Parterres de Broderies" led the way to Le Notre's masterpiece at Versailles. John Evelyn was not forgotten, and the Dutch style was illustrated by the garden of the Count de Nassau and Kip's Hampton Court, with its semicircular parterre of 9½ acres. Stowe was given as left by Bridgeman and sung by Pope, one of the pioneers of modern gardening. The old gardens of Oxford and Cambridge, Badminton, Chatsworth, and Chevening paved the way to the

English or landscape garden, derived from the Chinese Emperor's "Garden of Gardens." Horace Walpole, Kent, "Capability" Brown, and Humphrey Repton were all passed in review, being chosen as the typical landscape garden after Whateley's "Observations on Modern Gardening." The symbolical character of Japanese gardens was pointed out in two examples. Shenstone was cited as the exponent of what Mr. Sieveking called the "Jardin Larmoyant," or emotional and sentimental garden at the "Leasowes"; and Walter Scott was praised for holding the balance between the rival schools, while Gilpin, Uvedale Price, and Payne Knight reacted against the extreme theories of the naturalists. A tribute was paid to Mr. William Robinson's natural and wild gardening and Mr. Inigo Thomas's advocacy of the formal garden, and Mr. George Elgood's beautiful pictures illustrating English old-world gardens, and Drummond Castle, Balfour, and Stobhall Gardens (by Mr. Fred Walker, A.R.A.) represented Scotland. The lecturer took no side in the controversy between the natural and formal styles, preferring a judicious eclecticism, with the formal garden near the house, and passing, by harmonious transitions, to the park or landscape garden—from perfect art to wildest nature. He declared his belief that the garden-lover could not go far wrong if he would let Nature be his religion, beauty and art his creed, and took for his oracle Pope's verse: "Consult the genius of the place in all."

#### EXAMPLES OF DECORATIVE ART.\*

**A**N important representative work, by Messrs. Longmans, Green, and Co., is being brought out under the title of "Selected Examples of Decorative Art," published with the sanction of the Department of Science and Art, South Kensington, the first part of which is before us. The work is to be published monthly, and each number will contain twelve plates of photographic reproductions of objects in the South Kensington Museum, selected by the directors of that institution, and the work is edited by Mr. F. E. Withaus, whose experience in art matters is well known, and who will be assisted by specialists in their various branches. From a glance at the plates, we have every reason to believe that the work will be of much value to all students and teachers in art and technical schools, as the examples will supply them with a few of the finest and choicest productions in sculpture, woodwork, carving, furniture, hammered and cast iron, brass, copper, and lead work, silversmiths' work, glass, textile fabrics, &c. Part I. comprises several very beautiful examples of woodwork and carving, sculpture, gesso-work, bronze, brass, silversmiths' work, glass, &c. The first plate is a carved walnut stool, French, of the latter half of the 16th century—a bold and excellent type of carved woodwork. The ornamental carved end is particularly good in outline and bold in conception. Next we have a carved walnut door, 4ft. 7½in. high by 23½in. wide, the panels carved with a flat guilloche ornament, and the stiles and rails also carved in relief. The door is from Lyons, and is of the same date. A very fine specimen of gilded gesso-work is shown in a round wooden box and cover, Italian, of the 16th century, the low relief decoration of which is excellent. The cover and border have medallions representing the Signs of the Zodiac. Another example of gesso decoration is a fine wooden cassone (circa 1480): the frieze and sides and base are delicately modelled, and of Greek character. The other plates represent a Florentine marble bracket, a beautiful and chaste design; a chair-seat of cut leather (Portuguese); several very elegant examples of wine-glasses and tazze (Venetian) of the 16th and 17th centuries; cast bronze bells of Italian 15th century design, handles and door-knockers, 16th and 17th centuries; a silver-gilt pyx with enamels, German, and a monstrance of copper-gilt, Italian, 15th century; also a water-vessel of hammered brass, Flemish, of the 16th century. These examples of metal-work are of very interesting character, especially the hammered brass vessel. The mode of reproduction enables the student to distinguish every detail and ornament, the light and reflected light and shadow of the real object being before him, and

every texture and tool-mark discernible. The smaller objects, too, are in some cases nearly full-size, and the illustrations, printed from half-tone blocks, average about 12in. by 9in. The plates are detachable, and can be taken out for study. Each plate is 19in. by 12½in., and the price of each part is only 3s. net. All students and art workers should become subscribers.

#### RISKY BUILDINGS.

**L**ARGE commercial structures in the great cities of the United States are, through bad foundations or rapid building, exposed to many dangers and vicissitudes; and it is a common occurrence to hear of ingenious methods being resorted to in strengthening or restoring such buildings. The Building departments of cities like New York, Chicago, Brooklyn, have their work looked out in providing against collapses. At Brooklyn a large commercial building has recently been condemned as unsafe. It is reported as eight stories in height with a frontage of 110ft. oblique; it has large shop windows, the upper walls are of brick, the columns are of cast iron, the floor-beams of wood; but the description given of the building shows the top-heavy nature of the construction adopted. It appears that four 14in. circular columns are carried up in the front wall to the third story, each of these supporting at the centre a double cantilever girder of three parallel I beams 20in. deep, and upon which a brick pier, 8ft. by 20in., is built. From what we can gather of the rather vague description given, the upper six stories is carried on very weak piers. In fact, the whole building appears to be carried by columns and brick outer walls. The footings of the piers are faulty; they are built of common red brick in poor mortar. The piers are capped with blue stone flags of 12in. thickness in mortar beds, and on these cast-iron pedestals are set 45in. square; but the capstones are broken and the columns take an unequal bearing, the piers have bulged outwards, and some have vertical cracks. What condition of affairs could be worse? The building in question, not before time, has been shored up; the front wall braced from the street, the piers have been surrounded by vertical timbers to relieve them of their floor loads, and precautions have been instituted to watch any movement so as to avert danger. There are probably many other faulty buildings of the kind in Brooklyn and elsewhere; but the amazing thing is that lofty structures, built practically on piers of brick no more than 5ft. square and several feet high, and supporting prodigious dead loads of iron columns and floors on foundations of gravel and sand, should be permitted in great cities. Yet it seems a very common mode of supporting upper stories. In no other country but America would such experimental buildings be allowed to be erected. Let any practical man consider brick piers of about 5ft. square and 7ft. in height carrying iron columns of several stories, the weight on each of which would be from 300,000 to 500,000lb.; imagine, also, not only a dead load, but the live load of eight floors, a not very firm foundation, inferior bedding of capstones, and poor brickwork. Such an experiment would be pronounced risky, not to say hazardous, in the extreme; and yet buildings are erected on this system. If the experiment was devised for testing brick piers, we might understand, though could hardly admit the value of, such testing. Can we be surprised that all the brick piers bulged out, and that the vertical cracks appeared in several of them through the capstone, or that, in one case, the crack is such that many bricks have broken across on the face of the pier? Investigations conducted within the building have revealed other dangerous symptoms of impending danger. The foundation walls show settlement cracks, floor-beams have deflected, and other weaknesses have been discovered. The descriptive account from which we take our facts shows that risky construction has been accompanied by inferior workmanship. The basement, walls, and piers have been found to have been built with no regard to bond or soundness of construction. The facts, as recorded, afford an object-lesson that ought to lead our smart but venturesome cousins to a more serious view of the responsibilities of building, to say nothing of architectural repute.

The Earl of Ancaster has undertaken, at his own cost, to restore the parish church of Haccoby.

#### OBITUARY.

**MR. JOHN SAMUEL RAWLE, F.S.A.**, late of Elms Villas, Ealing, and for many years an examiner to the Department of Science and Art, South Kensington, died suddenly on Thursday, the 19th inst., while on a visit to St. Leonards-on-Sea. During the most prosperous period of its career, Mr. Rawle was the headmaster of the West London School of Art in Great Titchfield-street, W., and from thence he removed to Nottingham, where he maintained the high standard of the Corporation School of Art. He wrote several useful handbooks on practical geometry, drawing, and kindred subjects. Mr. Rawle was in his 60th year.

**MR. JOHN MARTIN MCCURRICH**, engineer to the Bristol Corporation Docks, died on Wednesday week, aged 46, as the indirect result of over-work. Mr. McCurich was educated at Dunning and at the Perth and Dollar Academies, and subsequently at Edinburgh University. After being articled to Messrs. Bell and Miller, Glasgow and Westminster, he became resident engineer on the new dock works at Cardiff, and he was afterwards with the Great Eastern Railway Company at Liverpool-street Station, London. He was appointed assistant-engineer to the Bristol Corporation Docks in 1885 and engineer in 1890, and was afterwards elected president of the Bristol Association of Engineers. As engineer to the Bristol Docks, Mr. McCurich designed and executed many important works, including an extensive scheme of port and river improvements for enabling deeper and longer vessels to get up to the city docks. He also designed several new schemes for extensive new docks at Avonmouth and Portishead, for the dockisation of the River Avon itself, and for the prevention of floods in the rivers Avon and Frome. The Bristol Docks committee have voted 1,000 guineas to Mr. McCurich's widow.

#### CHIPS.

The fifth annual dinner of the London and Provincial Builders' Foremen's Association will be held at Anderton's Hotel, Fleet-street, on Saturday, Feb. 11. Mr. G. J. Elphick, of the firm of Messrs. Treasure and Son, of Shrewsbury, will occupy the chair.

Contracts for the building of a large new hotel in Guild-street, Aberdeen, adjoining the offices of the Great North of Scotland Railway, were accepted on Tuesday. The hotel will cost over £12,000.

A new institute is now being erected at Longton, Staffs, from the designs of Messrs. Wood and Hutchings, architects, Tunstall, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

At a conference held on Wednesday between representatives of the London County Council and of the local governing bodies of London, it was resolved that the maintenance and control of all open spaces under ten acres be undertaken by the sanitary authority of the district, the Council granting annually to the local authority the amount of the cost of such maintenance and control on a certificate of the Council's officials that the expense had been incurred and the work properly carried out.

In the Court of Session, Edinburgh, on Wednesday, answers were lodged to the petition presented by John Martin, builder and contractor, 53, Dundee-street, Edinburgh; P. L. Henderson, architect, 122, George-street, Edinburgh; James Kinnear, builder, Pestabrig-terrace, Leith; and Redpath, Brown, and Co., ironworkers, St. Andrew-street, Edinburgh, for the judicially winding-up of Pattisons (Limited). That firm and the liquidators, in the answers, admit that the debts mentioned by the petitioners are unpaid, and that the Company is insolvent and unable to pay its debts.

At the half-yearly meeting of the London and Brighton Railway Company on Wednesday, Lord Cottesloe, who presided, explained the scheme for the improvement of Victoria Station, stating that their Bill proposed to acquire and utilise all the property lying between the railway boundary and the east side of the Buckingham Palace-road, from a point just north of Ebury Bridge to the present front of the station, without touching the Grosvenor Hotel.

The new docks at Leith are making good progress, and at the last meeting of the dock commissioners it was reported that certificates to the extent of £243,000 had been made out by the engineers in favour of Mr. John Best, of Edinburgh, the contractor.

New board schools are about to be built at Heybrook, Rochdale, from plans supplied by Mr. Townend, architect, of Rochdale.

\* Selected Examples of Decorative Art. Published with sanction of Science and Art Department. Longmans, Green, and Co.

## Building Intelligence.

**ARDNAMURCHAN, N.B.**—About three years ago the estate of Ardnamurchan was purchased by Mr. C. D. Rudd, of the South Africa Chartered Company. Ardnamurchan is one of the largest estates in Argyleshire, and extends to nearly 200 square miles. Since the estate passed into the hands of Mr. Rudd, great improvements have been executed, or are in the course of execution, all tending to its conversion into a sporting property. The eastern section of it particularly has been largely turned into a first-class deer preserve. The hills of Glenborrodale, Laga, Camusinnis, Tarbert, and Gortan have been cleared of their sheep stock and put under deer. Saddle-paths and carriage-roads, intersecting the country in every direction, are being constructed, affording employment to hundreds of local workpeople. Shieldbridge Lodge has been pulled down, and is being replaced by a more commodious structure. Glenborrodale Castle, erected about forty years ago, has been razed to the ground, and the contracts have been placed for a mansion-house on its site at a cost of £37,000. Certain additions and alterations are also to be carried out in connection with Kilchoan shooting lodge. Last year a geological survey of the estate was made at Mr. Rudd's instance. At Ormsaigbeg a rich stratum of iron ore was struck, and arrangements are in an advanced stage for the work of excavation to be commenced, and preliminary operations are being pushed forward with expedition. The mining works will give employment to upwards of two hundred men.

**CARDIFF.**—A special meeting of the Cardiff Town-hall Committee was held on Friday. Mr. Veall called attention to the fact that in the original plans for the new town-hall Press-rooms were provided for the assizes and police-courts, but in the rearrangement these had disappeared. Mr. Lanchester, who attended on behalf of the architects, Messrs. Lanchester, Stewart, and Rickards, stated that he was informed that the Press-rooms were not necessary. One of the consultation rooms could be devoted to Press purposes. It was resolved that this be done. Some slight alterations were made, and the committee then agreed to recommend the council to pass the plans, which will be on exhibition until their next meeting.

**DERBY.**—The Duke of Devonshire opened, on Friday, the Municipal Technical College. Situated in Green-lane, and built in the Gothic style, the new structure been erected from the designs and under the superintendence of Messrs. Waller and Sons, architects, Gloucester, and covers an area of 17,000 square feet. The different floors include a sub-basement, a basement, and first and second floors. The whole of the sub-basement is utilised for the heating and ventilating, which is on the plenum system, and in the basement are the engine-rooms, plumbing shop, and rooms for topography and manual instruction. On the ground floor are an art lecture-room, a physical laboratory, and several class-rooms, together with a committee-room and the secretary's room and office. An antique-room for art purposes, a lecture theatre for physical, chemical, and other demonstrations, and a mechanical drawing-room occupy the first floor; and on the top floor are chemical laboratories, classrooms, and an apartment for light and shade drawing. The college occupies the site of the late Central School of Art, built in 1875-6, at a cost of about £15,000, including the purchase of the site, and £25,000 has been expended on the present work of extension.

**LEITH.**—The Hospital is to be extended in commemoration of the Queen's Diamond Jubilee. The extension will take the form of an addition to the King-street pavilion, whereby the wards in the south end will be incorporated into the new building, and the present ward of six beds on each flat will be made wards of twenty beds. Dayrooms, baths, lavatories, and lifts will be provided at the ends of the wards. The present north wards will be utilised for the administrative offices, doctors' and nurses' rooms, kitchen, &c., of the new wards. The extension will allow of an increase of 27 beds in the King-street pavilion, and on completion the hospital will contain in all 102 beds, besides three isolation rooms. The accepted elevation shows a frontage to King-street on the lines of the existing work, but treated in a less severe style, and terminates with a gable and oriel window, with balustrading.

Ground on the other side of King-street, opposite the hospital, will be occupied by a new kitchen, laundry, and nurses' home. Plant for steam power will be put down for the kitchen and laundry, and it is intended to provide an installation of the electric light and motive power for lifts, &c. The nurses' home will accommodate thirty nurses. The buildings will be connected with the hospital by a subway under King-street. The total cost of the new buildings, including machinery and plant, is estimated at between £17,000 and £20,000. The plans have been prepared by Mr. W. N. Thomson, architect, Leith.

**KILLEAN, N.B.**—At Killean, Kintyre, on Friday, the new public library and museum buildings in Campbeltown, built and equipped by Mr. James Macalister Hall, of Tangy and Killean, at a cost of about £10,000, were presented to the town by the donor. The buildings, the memorial-stone of which was laid by the Duke of Argyll on Aug. 25, 1897, are of handsome design, and occupy a central site, with frontages to the harbour, St. John-street, and Shore-street. The Duke of Argyll has granted the ground free of feu duty during his lifetime. There is a library or book-store giving accommodation for over 10,000 volumes (the shelves at present contain 6,000 volumes), ladies' reading-room, general reading-room, museum or picture-gallery, and general news-room. A garden at the Shore-street front forms an adjunct to the museum for the exhibition of archaeological and other exhibits not requiring cover. The buildings and garden occupy an area of 1,450 sq. yds. The architect is Mr. J. J. Burnet, Glasgow.

**THE TOWER OF LONDON.**—With a view to erecting a building more in keeping with the surroundings, the present chief guard-house at the Tower of London is being pulled down. The building is situated between the tower containing the regalia and the steps leading to the quadrangle, the White Tower being immediately in the rear. The building has now been almost entirely demolished, the wall facing the steps referred to being alone left standing. This is to be utilised in the new structure, which, in addition to forming the guard-house, will contain rooms to serve, as heretofore, for reading, educational, and recreative purposes. The alterations will take about a year to complete.

### CHIPS.

A meeting of the Trinity Church Restoration Fund Committee was held on Monday at the town-hall, Hull. The total sum collected up to date was announced to be £3,577 8s. Mr. Brodrick, the architect, reported that he had received tenders for the bells.

The Corporation of Norwich have decided that certain land at New Mills, including cottages and stoneyard, be appropriated and adapted for stables, cartsheds, stores, and workshops for the purpose of the corporation, according to the plan prepared by Mr. Arthur E. Collins, the city engineer, at a cost not exceeding £12,000. In addition, the city engineer was instructed to repair the buildings at New Mills known as the old silk mills, and make them available for stores and workshops at a further estimated outlay of £900.

The report of the directors of the Metropolitan Company states that the company's engineer (Sir J. Wolfe Barry, K.C.B.) says that arrangements for the experimental electrical working between Earl's Court and High-street, Kensington, are well advanced, and that he expects them to be completed in about nine months' time.

The new barracks at Winchester, so far as the foundations are concerned, are being rapidly advanced by the contractors for this special portion of the work. The old structure of Sir Christopher Wren and his employer, Charles II., is now fast going underground, in the form of concrete, for the foundations, which occupy the site and area of the great western ditch of the Norman and Plantagenet fortress which the railway constructors filled up with chalk, hence the deep excavations required for the foundations, in which none of the fine stone-work will be buried, but will be utilised above ground for facing the barracks.

Electric power has been successfully introduced for blowing the new organ in Lincoln Cathedral. The wires conveying the current from the corporation service enter the cathedral on the south side, and are laid mainly underground. There are three motors of 3, 1½, and ¾ H.P. respectively, situate in the triforium, each working an independent set of bellows. The organist has absolute control of the motors, which he is able to start or stop by moving a switch, and the supply of wind is regulated by an automatic device.

## Engineering Notes.

**CITY AND SOUTH LONDON RAILWAY.**—The half-yearly report of this company states that the progress with the Moorgate-street extension has been uninterrupted. The works of the extension from Stockwell to Clapham-common are progressing very satisfactorily, and it is anticipated that the line will be completed ready for traffic early in the autumn of this year. The works of the extension through the heart of the City having now been completed, it is necessary that the remainder of the authorised undertaking, carrying the line to the Angel at Islington, should at once be proceeded with, and steps have already been taken to secure the site of one of the three stations along the route. In order to further facilitate and economise the working of the City and Brixton Railway, it has been arranged that, in lieu of providing a separate depot for the Brixton Company, a short tunnel should be made connecting that company's line with this company's depot at Stockwell. A Bill has been introduced into Parliament with this object. Pending these arrangements, the construction of the City and Brixton Railway has not yet been proceeded with.

**THAMES AND SEVERN CANAL.**—The old Thames and Severn Canal was again open for traffic on Friday through its entire length, and merchandise may now be sent from London down to the mouth of the River Severn by water; and it is possible to paddle a canoe inland from one side of England to the other—from Sharpness Point to the Nore Lightship. There are forty-four locks on the western side up to the famed Sapperton Tunnel, about 300ft. above the Severn at low water at Framilade, Gloucestershire, while fourteen locks have to be passed on the other side, going down to Lechdale, where the canal joins the Thames. The canal was projected a century ago by Mr. Brindley, at whose death Mr. Whitworth was appointed to carry it on. It commences at the Stroudwater Canal, near Stroud, and taking an easterly direction, runs through Stroud, Brimscombe, and, passing Cirencester and the head of the Thames, reaches Siddington, where a branch about a mile in length runs in from the town of Cirencester. Thence it passes on to South Cerney and Latton, where it is joined by a branch of the Wilts and Berks Canal, and thence, passing Cricklade and Kemsford, reaches the Thames through Inglesham Lock. The tunnel at Sapperton is 2½ miles long, 15ft. wide, and one arch 20ft. high at the highest point of the hill, which is of solid rock, and has no supporting masonry. The minimum height is 12ft. above the water. The traffic diminished year by year, and in 1894 an application was made for closing that portion of the canal between Chalford and its junction with the Thames—practically the whole length; but the neighbouring waterways opposed, and in the following year a trust was formed to take over the canal. They at once proceeded to restore the canal, and the work has now been accomplished, at a cost of about £15,000.

The concession for the Syria-Ottoman Railway from Acre and Haifa to Damascus has been re-secured by the Thames Ironworks and Shipbuilding Company.

The Great Western Railway Company have resolved to construct a passenger line between Rhos (Ruabon) and Wrexham, a distance of about four miles. The construction of the proposed line will be proceeded with at once. The land for the purpose has all been bought, and the notices to the tenants have expired. The money has been voted by the directors, and tenders for the work will be invited forthwith.

A license was granted on Monday by the Salford magistrates for a theatre of varieties to be built in the Broadway of that town. Mr. Frank Matcham, of London, is the architect, and the outlay on building will be about £30,000.

The work of laying down a second line of metals from Skegness to Firsby, to enable the increasing summer traffic to be dealt with more expeditiously, will be commenced shortly. A new waiting-room, booking-office, and station-master's residence are now being erected.

At Southport, on Tuesday, Mr. E. A. Sandford Fawcett, A.M.I.C.E., Local Government Board inspector, held an inquiry at the Southport town-hall into an application by the corporation to borrow £3,500 for the purposes of electric lighting, and £3,300 for promenade widening.

## COMPETITIONS.

**CREWE.**—A competition for a new club-house has just been held, limited to architects invited from Crewe, Southport, Burslem, and Leek. The designs of Messrs. Wm. Sugden and Son, F.R.I.B.A. (submitted under motto "Forward the Light Brigade"), have been placed first, and will be carried out by them.

**GLASGOW NEW ART GALLERIES.**—The official record of the awards in the competition for the eight seated figures to be erected on the pavilions of the new Art Galleries at Glasgow, with the names of the authors of commended designs, is as follows:—Sculptors selected: Music, Architecture, Painting, and Sculpture, E. Derwent Wood, Bloomfield Studios, London. Science, W. Birnie Rhind, Cambridge-street, Edinburgh. Religion, Johan Keller, Sauchiehall-street, Glasgow. Literature, Edward George Bramwell, London. Commerce, A. Fabbrucci, London. Commended:—Sculpture and Religion, W. Birnie Rhind. Commerce, W. W. Woodington, London. Commerce, Johan Keller. Religion, Edith Maryon, London. Painting, Wenlock Rollins, London. Science, C. Rutland, London. Literature, E. Roscoe Mullins, London.

**HULL.**—This Library competition has this week been settled. The award of the referee, Mr. Sidney R. J. Smith, has been confirmed, with the following result:—First premium, Mr. J. S. Gibson (Gibson and Russell), Gray's Inn, W.C.; second premium, Mr. H. F. Williams, Fleet-street, E.C.; third premium, Messrs. R. J. Sidgrove and A. A. Webb, Surrey-street, Strand. Mr. Gibson treats his front in a simple yet dignified manner, with a central gable and turret at angle (in the central gable is a seated figure). The reference library takes up the whole of the first floor, and corridor on ground floor runs all through building; the building to be in brick and stone. We understand it is the cheapest and most effective design submitted. The greater part of the designs were either too costly, bad in elevations, or communication only through rooms; some did not make use of the back site at all, and in some, though excellent in plan, it would not be possible to light the indicators. Some had the workrooms, &c., on second floor, and some in basement; many did not have newsroom next to lending library. Some were rejected on account of conditions, the perspectives being larger than allowed; others had coloured their drawings, and many because they were too costly and impossible. It was considered that the selected one was the most practical one consistent with the cost named. A surveyor checked cubes and cost for the committee.

**KNUTSFORD.**—Mr. George H. Willoughby, of the firm of Messrs. Woodhouse and Willoughby, King-street, Manchester, writes protesting against the unfairness of the set of "competitive conditions" issued to the profession by the urban district council of Knutsford, inviting architects to submit designs for the erection of new cemetery chapel, caretaker's house, &c. Mr. Willoughby characterises the instructions as a flagrant attempt of a public body to obtain professional services considerably below the recognised standard fees, and through the medium of inequitable and one-sided conditions. In the printed conditions issued no mention is made of the promoters' intention to call in a professional adviser; but, on the contrary, that "the council reserve the right to exclude all or any of the designs from the competition if the council consider its probable cost will exceed the outlay stated in the instructions" (note "probable"), or "if the council consider the designs sent in are not suitable." A further condition immediately follows—viz., "In the event of the council considering that no suitable design has been submitted, they will hold a further competition." Such terms, questionable and grossly unjust as they assuredly are to every self-respecting architect, pale, however, Mr. Willoughby remarks, into insignificance by comparison with the unfairness of the paragraph that follows—viz., "The architect to take out quantities for the erection of the chapel, &c., 'at his own cost,' and no extra payment will be allowed by the council in respect thereof." Finally, although the designs are to be submitted in "competition," the essence of which is an absolute preclusion from the possibility of disclosing the author's identity, yet "all plans are to be sent in with the author's name attached." The writer adds:—"It is a grave affront on the members of our body to ask them, 'with an absence of scruple amounting almost to genius,'

to prepare and submit drawings in competition on the condition that the fortunate architect—should the work go on—be paid for his services the ordinary fee of 5 per cent. on the stipulated outlay—viz., £4,000; but, at the same time, he must be prepared to pay away again 'half' his earnings to employ a surveyor to take out the quantities, as the competitive conditions naively state, 'at his own cost'—a charge which certainly ought to be borne by the council themselves."

**NEWCASTLE.**—The following are the architects selected to send in competitive designs for the new Infirmary:—Messrs. Armstrong and Knowles, R. B. Dick, J. W. Dyson, Dunn, Hansom, and Fenwick, C. T. Marshall, W. Lister-Newcombe, Oliver, and Leeson, T. W. Taylor, and Chas. Walker, of Newcastle; Gibson and Russell, H. Percy Adams, and Simpson and Allen, of London; W. Henman, Birmingham; J. H. Morton, South Shields; Frank Caws and J. Potts and Sons, of Sunderland; Clark and Moscrop, Darlington; Worthington and Son, Manchester; and F. R. N. Haswell, North Shields. Mr. Alfred Waterhouse, R.A., is to be the referee.

**STATES OF GUERNSEY.**—The new States Hall and Courthouse competition has been settled. Mr. Aston Webb, F.S.A., was the assessor. Six competitors were invited, and each receives fifty guineas honorarium. The following were the architects:—Messrs. Gibson and Russell, Gray's Inn; Mr. J. A. Gotch, F.S.A., Kettering; Mr. H. T. Hare, Bloomsbury; Mr. J. M. Brydon, Newman-street; Mr. Atkinson, Liverpool; and Mr. Edward W. Mountford, of the Adelphi. The prize has fallen to Mr. Mountford. The cost will be about £50,000.

## CHIPS.

An inquiry was held at the Guildhall, Stafford, on Tuesday week, before Mr. G. W. Willocks, Local Government Board inspector, respecting an application by the town council for the issue of a provisional order to partially repeal, alter, or amend the Stafford Corporation Act, 1896, so as to enable the corporation to borrow additional moneys for the purposes of the sewerage scheme.

Mr. Stanhope Forbes, A.R.A., has completed the mural decoration, "The Great Fire of London, A.D. 1666," which he has been commissioned by the Sun Insurance Office to paint for the Ambulatory of the Royal Exchange.

On Thursday in last week the Right Hon. James Lowther, M.P., opened the new centre block of the Margate Cottage Hospital, erected in commemoration of the Diamond Jubilee.

Messrs. Longmans and Co., are publishing the lecture delivered at Burslem on October 13, 1881, by William Morris on "Art and the Beauty of the Earth." The price is half a crown, and the book is printed with old-faced type and on hand-made paper in the style of the well-remembered Kelmscott Press publications.

At the Church of the Oratory, South Kensington, on Monday, a marriage took place between Miss Elise Janet Charlton, only daughter of the late Edward Charlton, M.D., D.C.L., of Newcastle, and of Mrs. Edward Charlton, of Victoria-road, Kensington, and Mr. Edward Doran Webb, F.S.A., architect, eldest son of the late Mr. Thomas Doran Webb, of North Wiltshire.

A stained-glass window representing St. Michael and the Dragon has been placed in the west end of Martin Hussingtree parish church, as a memorial of the late Captain J. Oswald Trotter.

The Rivers Committee of the Manchester City Council had a long discussion on Monday on the sewage problem. In the result a resolution was passed asking the authority of the council to appoint an engineer to draw up plans and estimates for proceeding to deal with the difficulty of the lines of the evidence given by the experts at the recent Local Government Board inquiry. It was decided to recommend the council to advance the salary of Mr. Gilbert J. Fowler, chemist at the sewage works, from £200 to £250, and that of Mr. A. B. Oxden, manager of the sewage works, from £160, in addition to house, &c., to £180 per annum.

Business in house property was brisk at the Mart last week, for, notwithstanding the good supply of property of this character, practically all the lots submitted changed hands at favourable prices. The registered returns for the week were £67,420.

Four stained-glass windows, representing the Four Evangelists, have been recently erected in the chancel of Clonfert Cathedral. The windows are the work of Messrs. Watson, of Youghal, who supplied the Oliver Goldsmith window for Forney Church.

## PROFESSIONAL AND TRADE SOCIETIES.

**BRISTOL SOCIETY OF ARCHITECTS.**—At the last ordinary monthly meeting, the award was made in the students' competition for measured drawings prizes, the first prize of six guineas going to Mr. C. F. W. Denning, articulated to Mr. H. Dare Bryan; the second and third prizes being equally divided by Mr. H. F. Smith, articulated to Messrs. Crisp and Oatley, and Mr. E. G. Rodway, articulated to Mr. H. Dare Bryan. The subjects drawn were of local and historic interest, and included Kewstoke Church and Cleve Abbey, Somerset; the cupola of All Saints' Church, City; the Mede tomb in St. Mary, Redcliffe, and the interesting little Georgian church on Redland Green. After the general business of the society had been transacted, a paper of much literary and artistic interest on "Rhythm in Design," was read by Mr. F. Bligh Bond, a cordial vote of thanks to whom terminated the meeting.

**SOCIETY OF ARTS.**—The meetings of the Applied Art section commence on Tuesday evening next, when Mr. Edward F. Strange will read a paper on "The Centenary Exhibition of Lithographs." At subsequent meetings during the session papers will be read on "Vitreo Enamels," by Cyril Davenport, February 21; "Craftsmanship and Its Place in a National Scheme of Art Culture," by Sir William Blake Richmond, K.C.B., R.A., March 14; "Modern Changes in Taste relating to Domestic Furniture," by George Lock, April 18; "Maiolica," by William Burton, May 2; and "Wrought Iron Signs," by J. Starkie Gardner, F.G.S., May 30.

There has now been subscribed to the Bishop How Memorial Fund £11,497 4s. 3d. Of the total £620 3s. 11d. has been given for the recumbent figure of the late bishop which it is intended to place in the cathedral. Towards the enlargement of the cathedral £10,877 0s. 4d. has been subscribed, £3,808 0s. 9d. having been received since Dec. 12. The total sum required for the enlargement scheme is £25,000.

In the parish church of Broadhembury, Devon, on Friday, a tablet was unveiled to the memory of the Rev. Augustus Montague Toplady, author of the well-known hymn "Rock of Ages," and vicar of Broadhembury from 1768 to 1778. The memorial tablet, which has been executed in marble by Mr. L. J. Watts, of Colchester, contains a medallion portrait.

At a meeting of the Leeds and Yorkshire Architectural Society held on Monday night in the old Medical School, Park-street, Leeds, Mr. H. M. Fletcher read a paper entitled "A Summer in Umbria," illustrated by lantern views of the lesser-known architecture of Central Italy.

Mr. Hopkins, the Lambeth Police-court Magistrate, delivered his judgment on Friday on a dispute between the Lambeth Vestry and the Southwark and Vauxhall Water Company, as to the terms on which the company should supply water for the streets. He decided that the price to be paid by the vestry to the company for the supply of water for the streets should be 6d. 1,000gal., the arrangement to cease on March 23, 1904.

The measure to empower the London County Council to make a new street from Holborn to the Strand, and a widening of Southampton-row, to widen High-street, Kensington, and to make other street improvements and works has been passed by the Examiners of Bills. Another Bill of the Council proposing to alter the constitution of the Lee Conservancy Board and to enable the Council to construct railway sidings at Horton Asylum, Surrey, has also been found to have complied with Standing Orders.

Mr. John Young, general manager of Glasgow Corporation Tramways, has prepared a draft scheme for the extension of the electric overhead system of traction to the various routes in the city. He recommends that the next section to be converted should be the main east and west route, from Whiteinch to London-road, and Dalmarnock, via Bridgefoot-cross. About 800 horses could be dispensed with. Mr. Young estimates an expenditure of £25,000 in providing additional car sheds at Coplawhill, and the cost of equipping the three routes at £54,000, in addition to £61,000, which would be the cost of renewing the lines in ordinary course.

The High-street of Glasgow, from the Tron Church to the junction with Parliamentary-road, has been laid with an electric tramway, which was inspected on Saturday by Major Marindin on behalf of the Board of Trade, who was accompanied by Mr. Young, the general manager, and Mr. Clark, the engineer.

NEW INFIRMARY FOR THE PARISH OF ST. MARY, ISLINGTON.  
—CORONER'S COURT, POPLAR.—NURSES' HOME, WANDSWORTH AND CLAPHAM UNION INFIRMARY.—WALSOKEN CHURCH.—HOUSE AT FLEET.—COTTAGES AT MATLOCK.—RESIDENCES, TAMWORTH ROAD, GRAVELLY HILL, BIRMINGHAM.

## Our Illustrations.

NEW INFIRMARY FOR THE PARISH OF ST. MARY, ISLINGTON, HIGHGATE HILL.

THIS infirmary is now being erected in the grounds of the late Small Pox Hospital, Highgate-hill, and when finished will accommodate 800 inmates. The late Small Pox Hospital building is to be altered and adapted to form part of the administrative section, and will contain about 90 bedrooms for nurses, baths, lavatories, and w.c.'s, in addition to suites of rooms for the medical superintendent, assistant medical officers, and matron, &c. The declivity of the ground has rendered it necessary to make the wards on the lower part of the ground four stories high, and those on the north side only three stories high, with the roof all on one level. The whole of the wards, rooms, corridors, &c., in connection with the same will have fireproof floors, and dados, 5ft. high above the floors, of white glazed bricks, with bull-nose bricks to all angles. The external walls are executed in grey stock bricks, with red bands and arches. The wards are 100ft. apart, and are connected together by means of inclosed corridors on the two lower floors, and open corridors on the two upper floors, and also by means of open iron galleries for fire-escape purposes. The centre building forms the principal administrative block, which is two stories high, except the centre portion of same, which is three stories high, and wherein is situated dispensary, surgeon's and operation rooms, anaesthetic room, &c. The laundry, mortuary, coffin-store, and other buildings will be erected in rear of the present Small Pox Hospital; communications will be made to same from the new buildings by means of a subway. The estimate for the work is £181,583. Mr. William Smith, A.R.I.B.A., of Chancery-lane, W.C., is the architect for the work, and Messrs. Kirk and Randall, of Warren-lane Works, Woolwich, are the contractors.

## CORONER'S COURT, ETC., POPLAR.

THE illustrations of the above represent a very complete set of buildings of their kind about to be erected by the Board of Works for the Poplar district in the High-street, Poplar. The buildings consist of the following:—Coroner's-court block, shelter block, and mortuary block. The coroner's-court block is placed facing the High-street, and contains the following accommodation—viz., a coroner's court, coroner's and jury retiring-room, witnesses' waiting-room, w.c., and lavatory accommodation, and apartments for the caretaker. The shelter block provides accommodation for two families to be used temporarily during the disinfection of their homes, where cases of infection have occurred. The mortuary

block consists of two mortuaries, the smaller one for infected cases with accommodation for eight bodies, and the larger for twelve bodies, on the catacomb principle, and a post-mortem room with laboratory. The buildings are grouped around a quadrangle, with the entrance for hearses, &c., in Cottage-street. The designs, of which Messrs. Lansdell and Harrison, of Bow-lane, Cheapside, E.C., are the architects, were selected by the professional assessor appointed by the Board in an open competition held in the latter end of 1896.

## NURSES' HOME, WANDSWORTH AND CLAPHAM UNION.

THE foundation-stone of the new nurses' home in connection with the infirmary of the Wandsworth and Clapham Union, on St. John's Hill, was laid last month. The home is being erected on the northern portion of the infirmary grounds. The building will provide accommodation for 75 nurses in separate rooms, apartments for the assistant matron, and for the principal night nurse. A recreation room for the general use of the nurses is placed close to the entrance-hall, and adjoining same is a separate sitting-room for the accommodation of 30 sisters; adjacent to these two rooms is lavatory and cloakroom accommodation. Leading from the entrance-hall is a wide corridor, on either side of which the bedrooms for the nurses are arranged, and a stone staircase placed centrally in the length of the building gives access to each of the four floors, having corridors right and left of same extending the full length of the building. Sanitary and bathroom accommodation is provided in a central portion on each floor, and a lift for boxes, coal, &c., runs the full height of the building, and also nurses' box-room, store-rooms for linen, bedding, &c. Two separate external fire-escape staircases are to be built. The night nurses' bedrooms will be placed upon the top floor. Each nurse's room will have a minimum floor area of 100ft., and will have an open fireplace with register stove and fresh-air inlet and extract ventilator. A fitted wardrobe cupboard is to be fixed in each room. The building is being constructed upon a fire-resisting principle. The warming to the corridors and supplemental heating to the recreation room, &c., is by hot-water radiators. The contractors are Messrs. Thomas Gregory and Co., of Clapham Junction, and the work is being carried out from the designs and under the supervision of Messrs. Lansdell and Harrison, of Bow-lane, Cheapside, E.C.

## WALSOKEN CHURCH, NORFOLK: NATIONAL BRONZE MEDAL DRAWING.

THE very capable water-colour drawing of the interior of this distinguished East Anglian church which we illustrate to-day was awarded a National Bronze Medal in 1898, and we are indebted to Miss Mary S. Peck, of Wisbech, for the loan of the original picture now reproduced. Walsoken is chiefly noted for its beautiful font, which is rightly reckoned as one of the best of its kind, even among the rich and interesting churches round about King's Lynn. This district is exceptionally favoured by grand churches, such as Swaffham, Holbeach, Whaplode, Gedney, Long Sutton, Moulton, Walpole St. Peter's, Tilney All Saints, West Walton, and the Wiggenshalls, not to go further afield. Walsoken Church is roomy and lofty, with a Perpendicular clerestory over a fine Norman arcaded nave. The hammer-beamed roof is contemporary with the clerestory; but it is unusually low in pitch, and this makes the hammer-beams look as if they were tilting. The ends of these timbers have carved and coloured angels upon them, and there are other angels in the cornices, with ornate niches below the wall-posts. Full-length figures are seated under canopies. To the south side of the choir there is a very delicate and beautiful oak screen, florid in its varied traceries, and enriched with vigorous carvings. The outer order of the mouldings has for the most part gone; but sufficient remains to show what it once was like. Some have said that this screen formed part of the rood screen to the chancel; but the door is too small really to ever have been used as the main entrance to so large a choir. The rood-screen, whatever it was, occupied a position east of the arch, as the doorway to the left clearly indicates. The screen there now is set on a dwarf wall, and looks uncommonly well. The font, which comes out so conspicuously in the accompanying picture of the aisle, is elaborated with sculptures representing the Seven Sacraments of the Church, the Crucifixion filling the remaining compartment of

the octagon. It is 4ft. 4in. high, and 2ft. 9in. wide at the top. The return stalls in the chancel are partly made up, but are original, and have grandly-carved elbows. We published a detail sketch of this font, and another of the choir-stalls of Walsoken Church, in the BUILDING NEWS for Aug. 23, 1889. These drawings are well worth looking up to compare with the present illustration.

## HOUSE AT FLEET, HANTS.

THIS house has been designed by Messrs. Hall, Cooper, and Davis, architects, of Westminster and Scarborough. There will be several fine views from the windows, one that will overlook Fleet-road. The materials used in exterior walls are stone and half-timber; the roofs to be covered with stone slates. The interior of large dining-room to be panelled, and have timber ceiling. The ingle-nook to be in stone.

## COTTAGES, MATLOCK.

THIS group of cottages, now building at Matlock, calls for no special mention. The walls are of local grit-stone, with the upper part brick, rough-casted and coloured, and the roofs are of red tile. The builders are Messrs. J. and W. Lewis, of Matlock Bridge; and the architects Messrs. E. Guy Dawber and Whitwell, of Buckingham-street, Adelphi, W.C.

## CHIPS.

The new workhouse infirmary at Wakefield was opened on the 19th inst. It has been built at a cost of £37,000 from plans by Mr. William Watson, of that city.

The Liverpool Corporation, after a long discussion, have decided to erect dwellings for the labouring class in Dryden-street and Rachel-street, from plans prepared by the deputy city surveyor, and to seek sanction from the Local Government Board to borrow £13,000 for carrying out the work, and a further sum of £50,000 for the demolition of unsanitary property.

The half-yearly report of the South Eastern Railway Company states that during the past half-year excellent progress has been made with the Charing Cross widenings and those below London Bridge, and also with the Hither-green sidings, which will be ready for use about the end of this month, and will give six miles of available standing room.

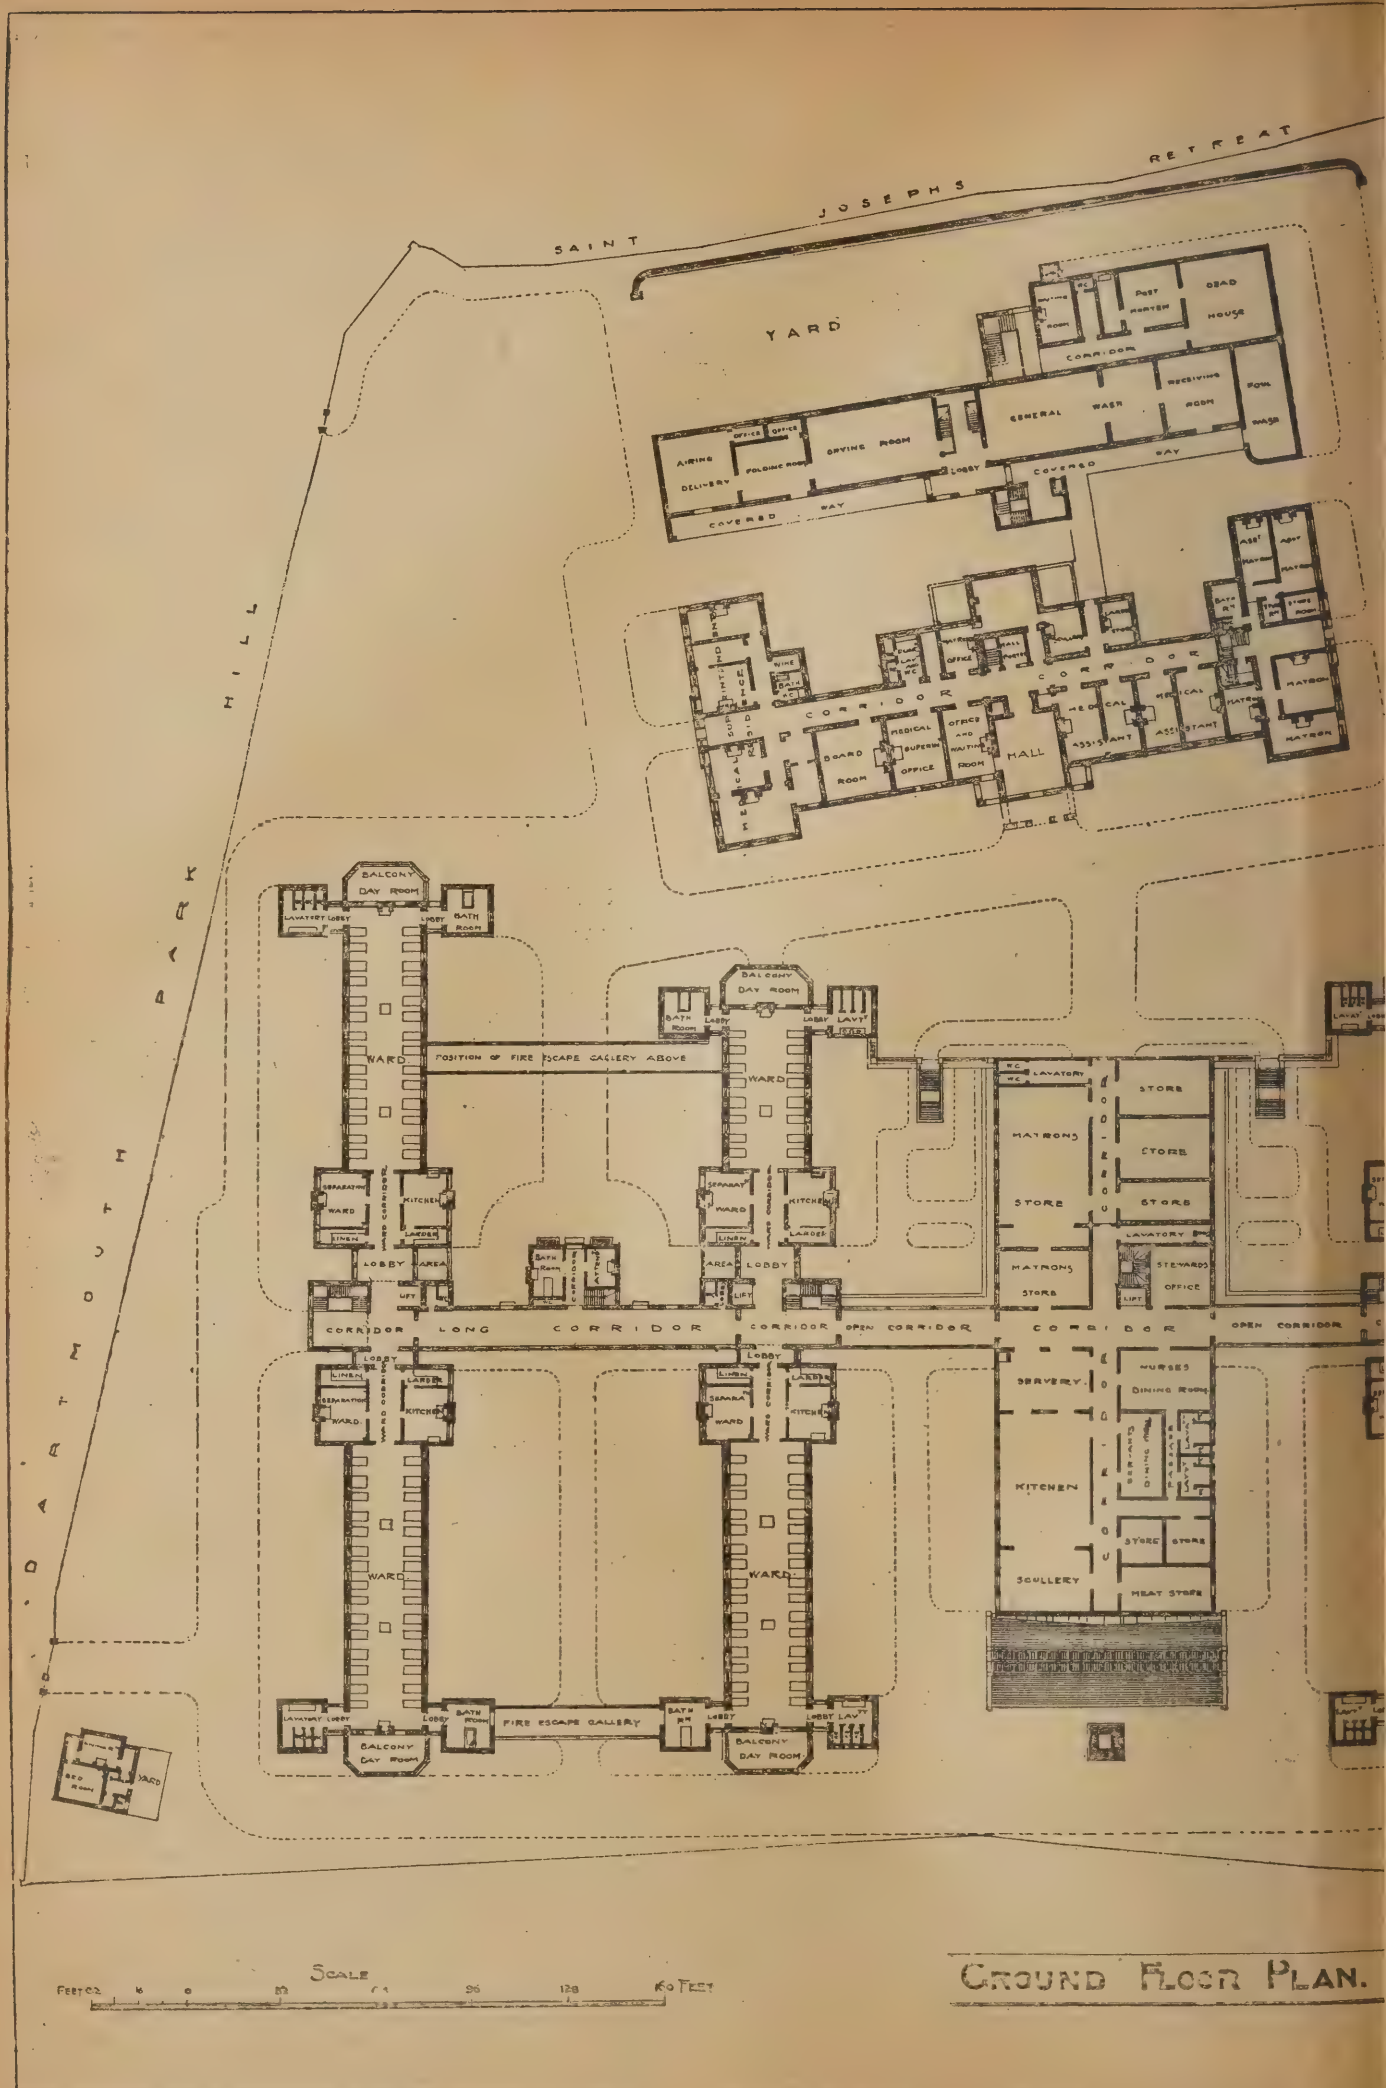

At a serious fire, which occurred on Friday evening in the basement of a six-floored warehouse, 90ft. long and 20ft. wide, in City-road, E.C., a new appliance, the invention of Commander Wells, was used for the first time. It consists of a nozzle by which the intensity of the water pressure can be instantaneously regulated to suit the particular requirements of the outbreak. This fire being a particularly smoky one, the firemen had a good chance of testing the appliance, and the results were deemed by those present to be satisfactory.

Mr. G. R. Bellamy, who has been appointed by the city council of Liverpool to the post of general manager of the tramway system, in succession to Mr. John O'Neill, entered the service of the corporation in 1882 as gas inspector, at a salary of £200 a year. He is now gas examiner, superintendent of street lighting, and official inspector of gas-meters, with a salary of £550, and in his new capacity he will receive £800, rising to £1,000 per annum.

At a consistory court held at Norwich on Saturday a faculty was granted for additions to the church of St. John the Baptist, Felixstowe. It is proposed to complete the east end of the church, with a chancel and a morning chapel; clergy and choir vestries, on the south side of the chancel, divided by a wooden partition; an organ chamber, &c. The chancel is to be divided from the nave by a brick and stone screen, 4ft. high, and the vestries and morning chapel by screens. The addition will provide 250 more seats. The plans and specifications are by Sir Arthur Blomfield, A.R.A., the estimated cost is £2,715, of which £800 has been subscribed, while the remainder will be advanced by Messrs. Barclay's Bank.

The Judges in the First Court of Appeal had before them on Saturday an appeal from a decision of Mr. Justice Stirling with regard to alleged damage to Whitmoor Common. The Guildford, Godalming, and Woking Joint Hospital Board are erecting a small-pox hospital in the neighbourhood of the common, and the plaintiffs, as the representatives of the commoners, sought an injunction to restrain them from injuring the property in the process of carting materials to the site. The defendants pleaded that they had undertaken to repair any damage, and Mr. Justice Stirling, under these circumstances, refused an injunction. The Master of the Rolls said this was a proper conclusion, and the appeal was dismissed.

1898, JAN. 27, 1899.

NEW INFIRMARY  
FOR THE GUARDIANS OF THE POOR  
OF THE  
PARISH OF ST. MARY, ISLINGTON.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and all communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FIVE WORDS, and Sixpence for every eight words after. A Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LII., LVIII., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—H. C.—S. N. Co.—D. E. S.—R. W.—O. M.—T. J. and Son.—E. H. R.

J. H. MASON. (We do not undertake to give estimates. With the information you give, moreover, it would be impossible).

## Correspondence.

## WESTMINSTER ABBEY.

To the Editor of the BUILDING NEWS.

SIR,—The suggestion put forth as to completing (sic) Westminster Abbey by the addition of a spire is not a novel one; nor was Sir Christopher Wren the first to formulate a scheme for such an addition. I believe that Abbot Islip, the architect of Henry VII.'s beautiful chapel and other important additions to the Abbey, actually designed, early in the 16th century, an addition to the tower with a lantern above; but the present tower was not found strong enough to bear the added weight. Probably, had the structure been erected, the tower of Westminster Abbey would have shared the fate of so many of our cathedral towers which fell from added weight upon imperfect foundations. I am not so sure, either, that Sir Christopher Wren's spire would have been a complete success, great artist as he was, for the two western towers which he completed (Abbot Islip carried them up as far as the roof-line), though pleasing in proportion, are a somewhat curious mixture of Renaissance and Gothic. The sketch which the *Daily Mail* published with its article showed a spire which seems out of all proportion with the Abbey—a sort of adaptation of Salisbury Cathedral spire. Further, surely the traditions of the Abbey seem to indicate a reposeful treatment for any addition to the last resting-place of our illustrious dead, and such a spire would break up the whole harmony of the beautiful picture now at last open to the eye

for an adequate view. If the Abbey is to have a spire, probably a wooden structure at a moderate angle would be best; but one almost shudders to think of the fate of the architect *unfortunate* enough to design such! He would first nearly be annihilated by Protection Societies of Ancient Buildings; and when they had finished with him, if anything was left, he would have the Press and the public to tackle, and the remaining stage is too much, even, for contemplation.—I am, &c.,  
Jan. 24, 1899. CHARLES E. SAVERY.

## Intercommunication.

## QUESTIONS.

[12161.]—Grouting Granite Cubes.—Would any reader advise me what is the best cement to grout granite cube paving with, whether slow or quick setting, and what proportion of sand should be mixed with it? The work is to be done in parts during the night, and the streets opened for traffic during the daytime.—SURVEYOR.

[12162.]—Architect's Charges.—What is the customary charge in or near Liverpool for approving plans submitted by the lessee and for inspecting the buildings during their progress so far as may be necessary to insure the conditions being fulfilled, and certifying for lease? Is the charge a percentage on the estimated cost of the building? If so, what is it?—A SUBSCRIBER.

[12163.]—Paper Floors.—These are constantly being mentioned in the paper as being used in Germany. Can anyone tell me price and durability?—INSPIRO.

[12164.]—Storage of Books in Public Library.—What is the rule for determining the space to be given up to the storage of a certain number of books? Is it customary to allow less space per (say) 1,000 in the "store" than in the lending library?—LIBER.

[12165.]—Fees.—What fees are payable by the London County Council to claimant's surveyor for making claim under the Housing of the Working Classes Act for improvement scheme?—SURVEYOR.

## REPLIES.

[12152.]—Architect's Charges.—In "H. L.'s" reply, the charges become still heavier upon employer owing to fees for superintendence. There should be some better understanding on the point, as it is clearly unsatisfactory at present. Ed. Calvert evidently speaks for the class of practitioner whose advice and views cannot be considered. Imagine the amusement of Messrs. Norman Shaw, Ernest George, and all those architects who design the decorations and fittings of their works throughout, at being spoken of as "heaven-born with genius." Artists like these know well there is no genius but that of hard and constant work and study, guided by artistic appreciation which gives happiness in their pursuit. No architect can be termed more than half-educated who has not made colour and decorations with all fittings in detail a careful study, as well as the technical and constructive branches of his calling.—M. A.

[12155.]—Block Tin and Cement.—I was under the impression that Portland cement did not have any effect on the pipes; but I know that lime will destroy them rather quickly.—L. E.

[12157.]—Baths.—In reply to "Amateur Builder," I should think that copper baths are generally used as

being the best. With reference to the query as to where the hot and cold supplies should enter and the overflow be taken from, the enclosed rough sketch shows an arrangement which has been found to work very well in practice. The only advantage of a cast-iron bath that I know of is the saving in cost.—THEOLA.

[12157.]—Baths.—Where expense is no object, the porcelain bath is best; where otherwise, copper enamelled baths are considered best. The waste should be trapped in a proper manner by use of the ordinary drawn lead S or P trap.—L. E.

[12156.]—Copper Roofs.—There is hardly any difference between laying zinc and copper roofs, except so

far as the size of the sheet makes a difference in the widths of the bays.—L. E.

[12156.]—Copper Roofs.—In reply to "Inquirer," a copper roof can be laid in exactly the same manner as one of zinc, and the sheets joined also in a similar way—that is, by soldering.—COPPERSMITH.

[12156.]—Copper Roofs.—Copper sheets are laid in much the same way as zinc; but being stronger, and its expansion under heat less, copper can be employed without the risks attending zinc. The sheets are laid between rolls or fillets of wood, and covered by a capping welded on both sides. The horizontal joints are welded as for zinc. Sometimes small sheets or embossed tiles of copper are used, which have their top edges turned down to hang on to battens; 16oz. copper may be used. Roofs should be boarded.—G.

[12158.]—Right of Light.—You can erect a board on your ground which will prevent his windows from becoming ancient lights. If your lights are not of sufficient standing to become ancient lights, I do not think you can prevent his stopping your light as he has done.—L. E.

[12158.]—Right of Light.—"Owner" can claim compensation for his neighbour's interference of light if the obstruction is serious, and he has had an unobstructed right of light of 20 years. In such a case he has a right to interfere; but he may not be able to prove his right of light. "Owner" does not say whether the projecting building adjoins his land. If so, he has a good case against his neighbour; but before making a claim a competent surveyor should be consulted.—G. H. G.

[12159.]—Lime Burning.—Rivington's "Notes," Vol. III., contains designs of kilns and method of working.—L. E.

## CHIPS.

The committee of the Carnarvon Cottage Hospital have received from Mr. J. E. Greaves, the lord lieutenant of the county, the gift of a site for the new hospital. This plot of land, which is near the station, is about an acre in extent, and the new building will be proceeded with at once. The building alone will cost from £2,000 to £2,500, and wards will be provided for males and females. There will be twelve beds, matron's room, and operating room.

The Lords of the Committee of Council on Education have arranged for a series of lectures to be delivered in the Lecture Theatre of the South Kensington Museum, on the following Saturdays, at 3.30 p.m.:—Feb. 11 and 16, Mr. J. H. Pollen, "Furniture"; Feb. 26 and March 4, Mr. William Burton, "Pottery." Admission will be free.

For the erection of the new workhouse at Nottingham the lowest offer submitted was that of Messrs. J. H. Williamson and Co., of Nottingham, for £149,500, who undertook that the works should be completed in 3½ years. Messrs. Williamson subsequently discovered that they had made an error in casting up their total, and they accordingly begged to withdraw their tender. The guardians agreed that this should be done, and they have since accepted the tender of Mr. F. Evans, of Old Basford, for £150,000, the work to be completed in 3½ years.

Mr. Aston Webb, F.S.A., the architect of the proposed Naval College, and Mr. Milner, the contractor for the work of laying out the grounds, have visited Dartmouth during the past week.

The Earl of Jersey, G.C.M.G., Colonel Boughey, C.S.I., and Mr. Gerald A. R. Fitzgerald, Light Railway Commissioners, held an inquiry at the Vestry Hall, Cranbrook, on Saturday, as to the expediency of granting an application made to the Board of Trade by the Rother Valley Light Railway Company, for an order to authorise the construction of the Cranbrook, Tenterden, and Ashford Light Railway. The proposed line will be 10½ miles in length, starting at Cranbrook by a junction with the Cranbrook and Paddock Wood Railway and terminating at Tenterden near the end of another projected line between Healdron and Tenterden. Two junctions with the Rother Valley Light Railway, now in course of construction, are contemplated. The line is estimated to cost £72,212, including the expense of tunnelling at Hartley Hill. Mr. Stevens, the engineer, described the plans, to which no opposition was offered.

New schools for the Ashley Down district are being completed for the Bristol School Board. The joint architects are Messrs. Paul and James and Mr. G. C. Laurence. Mr. E. Walters, of Montpellier, Bristol, is the contractor, and Mr. S. White the clerk of works. Accommodation is provided for 690 children, and the building materials are local bricks with Bath stone dressings and Bridgewater angular roof tiles.

The foundation-stones of the new Free Church in St. John's-road, Tunbridge Wells, were laid on Wednesday week. Mr. H. M. Caley, of Tunbridge Wells, is the architect, Mr. J. Marshall the builder, and Mr. H. Elwig Jones is the clerk of works.

Colonel T. L. Coke, M.Inst.C.E., held an inquiry in the council chamber at the town-hall of Burton-on-Trent, on Friday, relative to an application from the town council to borrow £24,940—viz., £19,790 for gas undertaking, £3,000 for public library purposes, and £2,150 for the isolation hospital.

## LEGAL INTELLIGENCE.

**AN ARCHITECT'S BANKRUPTCY.**—IN RE CHARLES MITCHELL.—In Kilmarnock Sheriff's Court last week, Charles Mitchell, architect (formerly a partner in the dissolved firm of Mitchell and Laugharne, architects and civil engineers, carrying on business in Kilmarnock, Edinburgh, and Dundee), presented a petition for his discharge as a bankrupt. Messrs. Yuille and Sons, slaters, opposed the petition, on the ground that the bankrupt's estate had only yielded a dividend of 3d. per pound to the creditors. The Sheriff-Substitute stated that the failure of the bankrupt to pay 5s. in the pound had arisen from causes for which the bankrupt could not justly be held responsible, but suspended his discharge for three months from this date. The firm of which the bankrupt was senior partner carried on business in Kilmarnock, Edinburgh, and Dundee as architects and civil engineers. His debts were mainly incurred in connection with building speculations in Kilmarnock, which were entirely a personal matter, his firm being no further concerned with them than that they were employed and paid as architects and measurers. The bankrupt embarked in these speculations with inadequate resources and disastrous results. After his sequestration in April, 1894, it turned out that all the houses which he had erected or was in course of erecting, and which he had not himself sold, were bonded to the full amount of their then estimated value. He seems not to have been guilty of personal extravagance, or to have speculated in any other way than building.

**NEWPORT BUILDERS AND OBSTRUCTED FOOTPATHS.**—Serious complaint has been made by the public of the conduct of Newport builders, who, when erecting new buildings, obstruct the footways and roadways with mortar, sand, bricks, and other building material. As a result of complaints, the corporation authorities instructed the police to take action in the matter. The police summoned two builders, who have been fined, the one 10s. and the other 10s. and costs. Another batch of seven cases of obstruction were up two days subsequent, when the Bench dismissed six cases on payment of 3s. 6d., the costs. In the seventh case the Bench imposed a fine of 5s., including costs. All the defendants promised not to offend in a similar way again.

**A BANKRUPT BUILDER COMMITTED TO PRISON.**—James E. Haswell, builder, of Fratton-grove, Fratton, again came before his Honour Judge Gye at the Portsmouth County-court on Thursday in last week to answer an application by the Official Receiver that he (Haswell), being an adjudged bankrupt, had committed contempt of Court, and should therefore be committed to prison. The alleged contempt was that bankrupt had failed to comply with an order of the Court that he should hand certain furniture over to the Official Receiver, and that by concealing certain of his assets he had not assisted his creditors to the utmost of his power in realising the estate. Further evidence having been given, the Judge delivered judgment, remarking that there was no earthly doubt in his mind, after hearing the affidavits and evidence, about the course of conduct debtor had thought fit to pursue in his bankruptcy. There could not be any shadow of doubt that the transactions in which debtor engaged were, from beginning to end, a series of frauds upon his creditors, which no doubt would have gone further had it not been stopped. Reluctant as he felt, when he found that a wholesale system of fraud had been carried on in the way in which debtor had done, supported by wholesale perjury, he would not shrink from his duty. Debtor had been guilty of contempt of Court and of gross and of wilful perjury, and he ordered him to be committed to gaol until his contempt was purged.

**A SEQUEL TO THE CRIPPLEGATE FIRE.**—WOODTHORPE V. SPENCER AND ANOTHER.—In this case, heard in the Queen's Bench on the 20th inst., by Justices Lawrence and Channell, the proceedings were initiated by the London County Council in consequence of the disastrous fire in Cripplegate, when great damage was done because the flames spread through openings connecting different buildings. The appellant Woodthorpe, who is in the employ of the Council, is the district surveyor under the London Building Act of 1894 for the northern division of the City, and he summoned before one of the City Aldermen the respondent, Mr. J. A. Spencer, for having between December 21, 1897, and January 5, 1898, contrary to the provisions of that statute, united a building known as 45A and 46A, Basinghall-street with a building known as 4, London Wall-avenue, and the other respondent, J. Husbands, for having aided and abetted the commission of the offence. The Building Act provides that buildings shall not be united except where they are wholly in one occupation or are constructed or adapted to be so, and it appeared that between the dates in question an opening or doorway was made between the two buildings on the first floor in spite of appellant's refusal to sanction such a change. This was said to be an offence against the Act, but it appeared that the original lease from the freeholder of the land required that there should be an

opening from end to end through the buildings connecting Basinghall-street with London Wall-avenue, and that the building was originally erected with an opening in the wall between the two houses on the ground floor so as to be available for occupation by one or more tenants. To meet the requirements of the tenants this opening was afterwards closed, and an opening, according to the appellant, illegally made on the second floor. Afterwards the respondents, who occupied between them the two buildings, made the opening on the first floor now complained of. The Alderman dismissed the summons, and the County Council now appealed. The Court was of opinion that the decision of the Alderman was right, and must be affirmed. The appeal was therefore dismissed with costs.

**A RAILWAY CONTRACTOR'S "EXTRAS."**—NUTTALL V. LYNTON AND BARNSTAPLE RAILWAY COMPANY.—This award of an arbitrator, stated in the form of a special case, with the object of obtaining the opinion of the Court as to the rights of the contractor, who had constructed the new line, came before Justices Bruce and Ridley in the Queen's Bench Division on Monday. The contractor, Mr. James Nuttall, entered into a contract to construct the Lynton and Barnstaple Railway—a single line about 19 miles in length—for £41,000. This sum, the company said, was for the construction of the line to the entire satisfaction of the engineer to the Board of Trade, and included earthworks, bridges, viaducts, culverts, &c. After the line had been completed, the contractor claimed a large sum in respect of "extras." In addition to the sum of £10,000 which he had been allowed and paid, the contractor claimed £30,325 8s. 6d. for blasting rock, and £6,092 in respect of excess quantities over the quantities shown in the drawings of the company's engineer. The claim was referred to arbitration, and in the result the arbitrator, Sir J. W. Szlumper, awarded the contractor £22,634 on his first claim, and £4,735 on the second. The case now came before the Court on a special case stated by the arbitrator raising two questions—first, whether he could be compelled to state a special case, and, secondly, whether his construction of the contract was correct. For the contractor, it was submitted that the terms of the contract did not deprive him from recovering the sums awarded him by the arbitrator, and that the Court ought not to grant a special case where the parties intended, as in the present instance, to have matters of fact and law decided by a lay tribunal. On behalf of the company, it was submitted that they had, throughout the inquiry before the arbitrator, maintained their right to have a special case stated, and that the contractor was not, under the terms of the contract, entitled to recover in any extras beyond those which had been allowed by the company and paid. The Court reserved judgment.

**A BRISTOL ARBITRATION AWARD.**—Mr. Frank Wills, who acted as arbitrator respecting the claim made by Messrs. Wilkins and Son, builders, of Bristol, against the Western Counties Agricultural Co-operative Association, Limited, of Plymouth, has just issued his award. The plaintiffs erected for the defendants a new warehouse at Bristol, and they claimed £1,426 for extras and damages arising out of the contract. The case was heard on November 11 and December 2, and by his award the arbitrator has found for the plaintiffs for sums amounting to £848 17s. 2d., together with all costs of the reference and award.

**RE ARTHUR BURE.**—An adjourned sitting for public examination was held on Friday, the bankrupt being described as of 37, Walbrook, land agent, and residing at Bellagio, East Grinstead. From 1880 to 1891 he carried on a land agency business, partly in his own name and partly through the medium of limited companies formed by him for the purpose; but in 1891 he was adjudged bankrupt; that since 1891, notwithstanding his bankruptcy, he had continued business as a land agent, and had also been engaged in forming and exploiting joint stock companies. The statement of affairs showed total liabilities £94,654, of which £15,407 were unsecured, and the bankrupt claimed to have a surplus of £230,557. He had previously failed on three occasions—in 1874, 1880, and 1891. He alleged that he had paid or settled all the debts in the 1874 and 1880 bankruptcies, and nearly all in the 1891 bankruptcy. Mr. E. L. Hough attended as Official Receiver, and Mr. Stopher on behalf of the bankrupt. It was stated that certain accounts filed by the bankrupt since the last sitting were not sufficient, and a further adjournment was granted.

The Bishop of Bath and Wells presided over a meeting of citizens at the Guildhall, Bath, held on Tuesday, to consider the question of restoring the west front of Bath Abbey, in connection with the 400th anniversary of the edifice to be celebrated this year. A resolution authorising the rector and churchwardens to take the necessary steps was passed. The Bishop said they aimed more at the repair of what already existed than at restoration with a free hand.

## WATER SUPPLY AND SANITARY MATTERS.

**LONDON WATER COMMISSION.**—At the meeting of this commission on Monday, Mr. C. E. Groves, chemist to the Thames Conservancy, gave evidence that there had been a great improvement in the water of the Thames since the Conservancy Act of 1894 had been put in force. So far as he knew there was no dangerous element in the organic impurity, and flood water might be safely taken by the companies at the first hour of flood. It was not within his knowledge that Dr. Klein's experiments had proved the presence of pathogenic organisms in the water supplied to Londoners. Mr. H. C. Bowles, chairman of the New River Company, said complaints in reference to their supply were comparatively few, and the water was admittedly of the highest quality. It did not appear to him that any real grounds existed for making the sweeping changes advocated by the London County Council. The undertakings of the London water companies were too big to be in any one hand unless they were administered by a Government department. At Tuesday's sitting Mr. Searle, secretary to the New River Company, put in tables showing the financial position of the company from 1879 to 1897. In the latter year the net profits were £270,036. Mr. J. Francis, engineer to the company, said it was now estimated that in 1937 the daily supply would amount to 63,000,000 gallons, with an addition of 25 per cent. for the maximum. This quantity the company would be prepared to supply whenever the occasion for it arose. The witness was of opinion that the county boundaries would form most unsuitable lines of division between water-supplying authorities. The Commission adjourned till Monday.

## CHIPS.

Mr. Walter Emden, L.C.C., J.P., P.S.A., has been placed by the Board of Trade on the list of surveyors and umpires from which selections are made by the Board of Trade for appointment in cases of disputed compensation for land.

Messrs. Jas. Hill and Co., of 100A, Queen Victoria-street, send us a copy of Section "F.O." of their catalogue, dealing with fanlight-openers, metal casements, ventilators, and which will be found most useful by all architects.

An effort is being made to raise £2,000 for the repair of the ancient and picturesque church of St. Thomas the Apostle, Navestock, near Romford. Of the Norman building, which took the place of the Saxon edifice in the 11th century, the north wall of the nave is a still remaining fragment, and 13th-century work can also be discerned in the existing building.

The Pemberton almshouses and the Catherine-lane almshouses at St. Alban's have just been put into a thorough state of repair, and have been improved structurally. Three local architects, Mr. S. Flint Clarkson, Mr. F. W. Kinneir-Tarte, and Mr. T. Foster Woodman, acted jointly as honorary architects.

A special meeting of the town council of Monmouth was held on Wednesday week to meet Mr. Lailey and Messrs. Bramwell and Harris, engineers for the sewage and electric light respectively. Mr. Lailey tendered a report explaining that the excess of the actual cost of the drainage above his original estimate was due to: the cost of iron instead of clay pipes, £2,065; diversion of mains, £584 19s.; wood and cement used in deep excavations, £350; extension of drains ordered by the corporation, and old drains (of which there is no record) giving trouble and costing extra labour. Mr. Williams, from Messrs. Bramwell and Harris, reported the electric-lighting work nearing completion, and hoped to give them light by March next.

The annual dinner of the Bristol Master Builders' Association was held at the Royal Hotel, College Green, Bristol, on Thursday night in last week, and there was a large attendance, under the presidency of Mr. A. Krauss.

An appeal is made by the vicar of Palling, on the east coast of Norfolk, for £2,000 for the restoration of his church, now a pitiable wreck, and a reproach to the diocese. The architect, Mr. H. J. Green, of Norwich, reports that a great portion of the walls will have to be rebuilt, an entirely new roof will have to be put on, all the windows in the church will have to be glazed, and new stone mullions throughout, the south porch will have to be rebuilt, and the entire church re-seated and re-floored. The tower will have to be re-roofed and new woodwork placed throughout; the only remaining bell is cracked so badly that it has been removed. The old three-decker pulpit and the square pews are of deal.

Professor Ewing has informed the Vice-Chancellor that an anonymous donor has promised £500 to be expended in providing apparatus for the Engineering Laboratory. This will allow a part of the apparatus to be ordered which the enlarged laboratory will require.

## Our Office Table.

WE are glad to learn that the members of the town council of Southampton have proved amenable to reason, and have refused to allow the picturesque Bargate which spans the High-street either to be removed or mutilated, in order to facilitate the working of the tramcars by an overhead system of electricity. At the meeting of the town council on Wednesday a lengthy petition protesting against the Vandalistic proposal was presented, signed by members of the Royal Academy, Oxford University, art and antiquarian societies in London and the provinces, and over 3,000 ratepayers and others interested. This opposition had great weight, and the members referred to a committee the consideration of whether the difficulty as to the trams shall be overcome by forming a circus round the gate, which will obviously be a very expensive measure, but would facilitate general traffic, or by the simple expedient of lowering the roadway under the central arch, and forming a dip in either direction in the approaches.

UNFORTUNATELY, protests have been of no avail in influencing the minds of a town council almost at the other extremity of the kingdom—that of Aberdeen. The corporation of the "granite city" have now consented, after much hesitation, to permit the "removal" from the quadrangle of Marischal College of Greyfriars Church, in order to facilitate the scheme for extending the University buildings. The old church is the only remaining example of pre-Reformation architecture left in Aberdeen, and the last fragment of the buildings that originally belonged to the University. Its removal is the less justifiable, as a scheme had been prepared for its retention and restoration, and promises amounting to £28,000 had been offered for incorporating the church in a new group of university buildings which would have presented a harmonious masonry frontage to Broad-street.

A COURSE of lectures on matters connected with building will be given at Carpenters' Hall, London-wall, on Monday next and the four succeeding Mondays, at eight o'clock. On January 30 the lecturer will be Mr. J. Mansergh, M.Inst.C.E., and the subject "The Bringing of Water to Birmingham from the Welsh Mountains." The Master of the Carpenters' Company will preside. On February 6, when Cardinal Vaughan will take the chair, Prof. Banister Fletcher, F.R.I.B.A., will lecture on "Ornament." On the 13th, under the presidency of Sir Arthur Arnold, Mr. Basil Mott will describe the building of an Underground Railway. On the 20th, Prof. Roger Smith, F.R.I.B.A., will discourse on "Terracotta: its Nature, History, and Use." Mr. Water Crane will preside. On the 27th, Mr. William Poel, director of the Elizabethan Stage Society, will lecture on "English Playhouses in the Sixteenth, Seventeenth, and Eighteenth Centuries." Sir Squire Bancroft will be the chairman. Each lecture will have lantern illustrations. Admission can be obtained gratuitously by ticket to be obtained at Carpenters' Hall.

DR. W. R. W. STEPHENS, the Dean of Winchester, makes an appeal for further contributions towards the repair of his cathedral. Very extensive repairs of the roofs were commenced, he remarks, in April 1896, and most of them have now been completed, including the whole of the main roof of the nave, and the stone vaulting, which was in a critical and dangerous condition, the north transept and its aisles, the choir and the south aisles of the same, together with some repairs to the timber of the central tower. The total cost of these works, with the architect's commission, amounts to £11,918 10s. 11d. There is still needed about £4,400, partly to pay for the work that has been completed, and partly to meet the cost of further repairs not yet begun, but urgently needed. These latter include the roof of the south aisle of the nave, estimated at £1,060, of the large, flat roof of the retrochoir and its aisle, estimated at £1,065, and of the eastern aisle of the south transept, estimated at £435. When these are finished the whole of the main fabric of this vast Cathedral (which the Dean asserts to be the longest church in Europe, except St. Peter's at Rome), will have been put into sound and solid repair. The whole of the work has been executed by Messrs. Thompson, of Peterborough, under the superintendence of the

surveyor to the Dean and Chapter, Mr. Colson, F.R.I.B.A., of Winchester, whose plans for strengthening the nave roof and relieving the pressure of the timber on the vaulting received the approval of Sir J. Wolfe Barry, who was consulted on the matter.

At a meeting of the vestry of St. Margaret and St. John, Westminster, held on Wednesday evening at the Westminster Town-hall, the works and general purposes committee brought up a report calling attention to the risks to which the public have been exposed during the recent high winds by reason of the excessive height of hoardings on the public highway. After discussion a resolution was passed to the effect that it be a standing order of the vestry that no hoarding upon or over the public highway be sanctioned under any circumstances of a greater height than 12ft. without the previous sanction of the works committee; that every hoarding be required to be surmounted by a sufficient "fan," of such width and at such angle as will insure the public safety, and that proceedings be forthwith taken against licensees in all cases of infringement of conditions and regulations upon which the licenses are granted.

At Mason University College, Birmingham, Mr. F. A. C. Morrison has commenced a course of lectures on the history of Greek sculpture. In his first lecture, dealing with the origins, he sketched the various phases of Greek pre-historic art, as it is known to us from the finds at Troy and Mycenae onward to the Geometric and Orientalising pottery of the 9th and 8th centuries, B.C. Numerous idols, the earliest representatives of the plastic art, were shown by means of lantern-slides, as well as many fine specimens of gold work and ceramic ware. The only monument, however, which the lecturer emphasised as worthy of the name of sculpture was the Lion Relief from the citadel gate of Mycenae, the other objects being chiefly important as exhibiting to us the seething influences at work on Greek soil before the rise of free sculpture in historical times. These influences, and the different racial movements that affected art in this period, were briefly described.

An extraordinary piece of house-moving was successfully carried out in New York a fortnight ago. In consequence of the widening of a street, it was necessary to remove a block of four five-story brick houses. The street was to be increased in width 40ft. on each side, and the most available new lot to set the houses on was at some little distance, so that it was necessary to transport them 115ft.; but the only alternative was to pull them down entirely, and, as they cost £4,000 each, to build, the owner decided to take the risk of trying to move them. A plan was devised for transferring them on greased ways, instead of the usual rollers, and the scheme was carried out with complete success. The first step was to insert 375 jack-screws successively in openings made for the purpose in the foundation walls. By means of the jack-screws the whole block was raised, and it was then removed to the new site without difficulty on the greased tracks.

A LECTURE on "Some of the Arts and Crafts" was given on Friday night, at the Manchester School of Art, by Mr. C. R. Ashbee, of London. Mr. C. Rowley presided. Mr. Ashbee was the founder of the Guild and School of Handicraft at Essex House, and his lecture was on its work and methods. He said the work at Essex House was an experiment in the application of old-world methods in handicrafts to modern artistic and utilitarian requirements. There were two departments: the productive workshop and the department which concerned itself with education in handicraft. Their aim was to turn out work that was not ear-marked with commercialism, and they were inspired very largely by the teaching of Ruskin. For the most part they produced things which might be described as subordinate to architecture—objects of decorative art in the largest acceptance of the term, such as work in gold and silver and yellow metal, smith's work, the setting of precious stones, leather work, furniture and other internal fittings, and, in general, such things as could be done without the assistance of the machine. He did not decry machinery; but when it was introduced into a workshop it was apt to get out of control and destroy the possibilities of individual work. Machinery should be the slave and maid-of-all-work; but as matter of fact it had made itself the master. The guild had been carried on on the principle of an

industrial partnership; but last year it had been made into a limited liability company, without, however, materially altering the old conditions. The three things they aimed at were—first, artistic quality in their work, then the quality of joy in production, which was dependent on the first condition; and, third, the human quality, which followed as a necessary consequence on number two.

WITHIN the last nine years 136 miles of streets in New York have had their pavements of granite blocks replaced with asphalt. The process is still going on, and, although about 250 miles of street pavement still consist of granite blocks, these will be gradually abandoned, and asphalt substituted, except in the lower parts of the city, and on the water-front, where stone-paving will probably always be necessary, to endure the heavy traffic. Only a few yards of wood-block pavement exist in the city, this being in Twentieth Street, between Broadway and Fifth Avenue, and the ancient macadam has almost nearly disappeared, only 18 miles being left in the entire island of Manhattan.

A PECULIAR case, in which the Field Columbian Museum, in Chicago, is defendant, is, says the *American Architect*, before the Illinois courts. Four years ago, Messrs. Maw and Company, of Benthill Works, Jackford, Shropshire, and London, the well-known manufacturers of tile and ceramic productions, sent to the museum for exhibition, as a donation, a quantity of mosaics and other articles, valued at fifteen thousand dollars, or say £3,000. The authorities of the museum placed on exhibition some of the articles, but put the greater portion in storage, and notified Messrs. Maw and Company that they were not wanted, and would be returned if requested. Notice was given that they were not insured. Some time later fire broke out in the warehouse where they were stored, and the goods were slightly damaged. It does not appear that Messrs. Maw and Company ever reclaimed the articles, and some time ago they were sold at auction by the director of the museum, together with some other museum property, the whole bringing five hundred dollars. Now Messrs. Maw and Company claim fifteen thousand dollars' damages, maintaining that their goods were given to the museum only for exhibition for educational purposes, and that the museum had no right to sell them.

### CHIPS.

The directors of the Royal Lunatic Asylum at Dundee are about to proceed with the erection of a new private asylum at an estimated cost of £15,000.

According to present intentions, the extension to London of the Great Central Railway will be opened for traffic of all descriptions on March 1.

The largest stone ever delivered in Exeter arrived there on Friday, via the Midland and South-Western Railway. It consisted of a huge block of yellow magnesium limestone, raised in Messrs. Lindley and Sons' quarries at Mansfield, in Nottingham, weighing 9 tons 18 cwt., and containing no less than 165 cubic feet. This immense stone is destined to form the colossal figure of the Crucified Christ which Messrs. Harry Hems and Sons, of Exeter, have been commissioned by Lord Aldenham of Aldenham to execute for the high altar screen at St. Alban's Cathedral.

On Saturday, Mr. G. W. Willcocks held an inquiry at Winsford with reference to the application from the urban district council to the Local Government Board for sanction to borrow £400 for the works of water supply, and £100 for improvements at the baths, as well as for a further sum for the extension of the water mains to Woodford Hall Gate. Mr. Hulse, the surveyor to the council, explained the plans.

The Great Western Railway Company will commence their important scheme of docks and harbour extension at Weymouth without delay. An entirely new harbour is to be constructed on the Portland side of the Nothe, and docks and quays will also be constructed with the necessary railway connections, the estimated cost of the works being nearly a quarter of a million.

Mr. P. C. Cowan, County Surveyor of Down, has been appointed Chief Engineering Inspector to the Local Government (Ireland) Board.

A memorial window of stained glass has been placed in the gable of the western transept of West St. Giles, the Meadows, Edinburgh. The window is one of three lights, with tracery openings, and the subject is "Christ Blessing Little Children." The work has been executed by Messrs. Barnett and Son, of Leith.

## MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (TO-MORROW).**—London and Provincial Builders' Foremen's Association. "Some of the Laws relating to Metropolitan Sanitation," by Isaac Young. Memorial Hall, Farringdon-street, E.C. 8.30 p.m.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

## The Society of Architects.

Founded 1884. Incorporated 1893.

THE SOCIETY OF ARCHITECTS, St. James's Hall, Piccadilly, W., will hold an EXAMINATION in Architecture and Construction on APRIL 12th, 13th, and 14th, 1899, in the following subjects:  
Section I.—ARCHITECTURE. Subject (a), Planning and Design. Subject (b), Architectural History.  
Section II.—BUILDING CONSTRUCTION and MATERIALS. Subject (a), Construction. Subject (b), Materials.  
Section III.—PRACTICE. Subject (a), Specifications. Subject (b), Measurements and Valuation. Subject (c), Contracts.  
Section IV.—SANITARY SCIENCE.  
The latest date for entering for the Examination is March 23rd, 1899. Syllabus free. Copies of the last Examination Papers, one shilling.  
To that Candidate who shall pass the Highest Examination, the GOLD MEDAL of the Society will be presented, a SILVER MEDAL to the second in merit, and BRONZE MEDALS for special excellence.  
ELLIS MARSLAND, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.

Plans of the proposed new line from Manchester to Middleton, for which Parliamentary powers will be sought next session, are now to be seen. The line will be four miles seven furlongs 74 chains in length. The stations will be placed at the junction of Henhurst-street and Queen's-road, Manchester; Parkfield-street in Barnes Green; Market-street, Blackley; and Boothroyden-road for Higher Blackley and Rhodes.

Consequent on the retirement of Mr. R. H. Boyce, C.B., at the end of next month, Mr. H. N. Hawks, the senior assistant surveyor in Her Majesty's Office of Works, Edinburgh, has been promoted to the post of surveyor at the head office, Whitehall, London, to take charge of Customs and Inland Revenue Buildings, County Courts, and Probate Registries throughout England and Wales.

Mr. Henry Thomas Gordon, F.R.I.B.A., of Blomfield-street, E.C., has been elected chairman of the Coal, Corn, and Finance Committee of the City Corporation; and Mr. A. E. Pridmore, M.S.A., 2, Broad-street, has been elected chairman of the Music Committee of the same body, in succession to Mr. Gordon. Mr. Alexander Ritchie, J.P., of the firm of Archibald Stevens, McDowell, and Co., has been elected chairman of the General Purposes Committee.

The new bridge erected over the River Cart at Millbrae, between Glasgow and the district of Newlands, at a cost of £4,353, by the corporation of Glasgow and the county council of Renfrewshire jointly, was opened for traffic on Friday. The bridge is of one span, of Lochaberbriggs sandstone, with the facing of the arch and the parapets in grey granite, and a width between the parapets of 50ft. Messrs. Morrison and Mason, Ltd., of Glasgow, were the contractors.

A judgment summons from the High Court, entitling G. F. Giles, builder, St. Austell, to £36 from Rev. F. S. Ross, vicar of Trevellyn, came before Judge Granger at St. Austell last week. The sum represented the balance of an account for work done at the vicarage. A solicitor said terms had been arranged, defendant agreeing to judgment for £13 and costs, to be paid at once, and £22 in two instalments at three and six months. Defendant having assented, judgment was entered accordingly.

Mr. J. M. Richards, contractor and builder, died at his residence, St. Michael's-terrace, Helston, at ten o'clock on Monday week, after a long illness. Mr. Richards, who was in his 60th year, leaves a widow and three daughters.

## Trade News.

## WAGES MOVEMENTS.

**LONDON PLASTERERS' DISPUTE.**—A private meeting of the members of the National Association of Operative Plasterers was held on Monday night at the Memorial Hall, Farringdon-street. There was a crowded attendance, notices having been sent out to all the London members, close upon 4,000 men. The question of the dispute which has arisen between the Union and the Master Builders' Association, in consequence of nearly 140 men having struck work a fortnight ago at three London firms, for the reason that those firms had refused to allow their foremen to join the Union, was discussed at length. No decision was arrived at; but another meeting will be called next week to further consider the matter. A meeting of master builders and other employers of plasterers in London was held in St. Martin's Town Hall on Tuesday afternoon. The meeting discussed the advisability and the necessity of taking immediate action, and, while the desirability of avoiding a general strike or lock-out was admitted, there was a strong feeling that the action of the members of the Plasterers' Union had now made it imperative that the employers should take some steps for the protection of their interests and the safety of the trade. It was urged that the Central Association of Master Builders should support the three firms concerned in the action they had taken. Mr. Costigan, the secretary, stated that a resolution was passed to the effect that the meeting should "adopt and carry into effect, at the earliest possible moment, the policy proposed by the National Association of Master Builders, with which Association the Central Association in London is affiliated." This decision is equivalent to an intimation that a general lock-out of plasterers may be instituted at any moment.

**KIRKCALDY.**—The secretary of the Master Joiners' Association, Kirkcaldy, on Saturday received notification from the secretary of the Operative Joiners' Union demanding an increase of wages to the extent of ½d. per hour.

## CHIPS.

Mr. W. Goscombe John has been selected as the sculptor of the Daniel Owen monument to be erected at Mold.

Park Terrace Chapel and Mission Hall, in Earl's Court-road, London, was destroyed by fire late on Thursday night.

Mr. Henry H. Bander, of Albany, has been appointed superintendent of buildings of the State of New York.

The demolition of what has come to be styled the old town-hall at Colchester—a dull, pseudo-Classic building completed in 1852—is now in full swing. The estimated cost of the new town-hall, which is being erected by Messrs. Kerridge and Shaw, of Cambridge, from plans by Mr. John Belcher, of London, is £36,000.

Mr. G. W. Willcocks, M.Inst.C.E., held an inquiry at Lancaster on the 19th inst. into the application of the town council to borrow £20,250 for street works and the extension of the electricity works. The town clerk stated that £7,000 was wanted for the Rumparts and Derby-road, £2,000 for Horse-shoe Corner, £1,250 for Church-street improvement, and the remainder for electricity works.

The Lord Mayor of Liverpool unveiled, on Friday, a memorial tablet, which has been placed on the front of the house 118, Duke-street, in that city, in which Felicia Dorothea Hemans, the distinguished poetess, was born. The tablet is a result of the action of the members of the Lancashire and Cheshire Historic Society, whose badge occupies a prominent position on the memorial. An effective dark-blue background throws out the inscription in bold relief, and the record is inclosed in a teak frame. Mr. W. F. Price, of Liverpool, prepared the design of the tablet, which has been carried out by the Della Robbia Co., of Birkenhead.

A painting by Mr. Wyndham Hughes, of "The Feeding of the Five Thousand," has been placed on the north wall of the chapel of St. James's Church, Birmingham. The painting, which is 18ft. in length, and completes the chancel decoration, depicts Our Lord in the act of blessing the five loaves and two fishes. He is attended by His apostles, those immediately behind him being St. Peter, St. James, and St. John. The hills in the distance represent those rising above the Sea of Galilee.

The town council of Cambridge have decided to call in Mr. Dibdin to advise them upon a method of sewage treatment at a fee of fifty guineas and travelling expenses. The council have received the sanction of the Local Government Board for the borrowing of £17,260 for laying wood-pavement in the main thoroughfare from the railway station to Christ's College.

AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2300.

FRIDAY, FEBRUARY 3, 1899.

## COMPLIANCE WITH CONDITIONS.

FAILURE in competitions for buildings as often occur from a too loyal obedience to the terms of the instructions as from non-compliance or recklessness. The author of a design, not compassing clearly what is intended, falls back on a literal rendering of the conditions. For this reason the chief qualification of a competent assessor or judge seems to be a keen discernment of how much of a plan ought to agree with the instructions and how much may be left to the author's discretion and judgment; in other words, a judge of designs ought to be able, adopting a common phrase, to "read between the lines." If he is not able to do this his judgment often goes astray: he sees compliance in one plan and not in another, just as his own knowledge of the particular class of building he is adjudicating upon is full, or not. An incompetent assessor is likely to betray his ignorance of essentials by deciding on some non-essential of the plan, or falling back on the letter of the instructions. We can, for instance, imagine such an umpire adopting the perfunctory way of making a selection used by surveyors called in to check the cubed estimates of designs, by measuring the cubical capacity of each, and pricing out at a certain price per foot. On this system, taking the designs as a whole, he would examine each as to the several items of the instructions, say, for instance, the size and area of public hall, clerk's and surveyor's, accountant's, medical officer's, and other departments, as given in the conditions, discarding those plans which fell short in area, or made them larger, and by such a process select a few out of the whole number which complied with the instructions. Indeed, he could simplify his labours by setting his clerk on to an examination of this kind, asking him to make a tabular return of all the designs under certain heads; his task would then be simply to compare the return made, and finally adopt the plan which complied nearest to the instructions. Such a statement of facts would embrace the area covered by building, that of each official department or room, lines of frontage, compliance with ancient lights, and other details. The plan which fulfilled the most accurately these points would be the successful one. It would be rather the solution of an arithmetical puzzle than of any real merit. What else could we expect? This is certainly not the way to comply with a set of ill-drawn instructions, and few committees or their architectural advisers would like to be tied by their own tentative suggestions. On this principle of adjudication very few successful competitions have been awarded, and there would have been no architecture worthy of the name if our Barrys, Streets, and Scotts had been so tied down to literal interpretation. Whether a public hall or a suite of offices is so many feet more or less in length and width than a prescribed limit does not matter, if a sufficient accommodation is provided for and the means of entrance and access are good. Nor can the position of a suite of rooms or offices on one floor make all the difference between a good or a bad plan. On the other hand, an able plan is at once recognised by a general alignment of main walls, a principle or motive in the arrangement, good entrances and access to the offices, efficient lighting, and other details. The qualified judge is able to draw a definite line between a mere

literal compliance with instructions and an intelligent grasp of main principles. As omission does not always mean prohibition, neither do distinct instructions preclude better modes of dealing with the subject. Of course, there are some instructions that are imperative. There are those, for example, which refer to matters like frontage lines, areas for air and light, rules and regulations of by-laws—like those of the London County Council which relate to sanitary matters—sufficient entrances and exits, width of staircases, construction of same, width of doorway, &c. A competitor who violates any of these does so at his own peril, and disqualifies himself even where his plans are otherwise excellent. These technical points are, no doubt, troublesome and irritating to men who are impatient of technicalities, and we know a few strongly artistic men who resent these details, and so entirely ignore them as to disqualify their designs in competition.

In this connection we may refer to the Soane Medallion Award at the Institute, on which we printed last week the text of a memorial presented by students and others to the Council, asking them to reconsider their decision as to the recent award in the Concert Hall Competition. The memorialists add in parallel columns the points of the design which violate the regulations of the London Building Act. These refer to several things. Dressing-rooms are required to be arranged in separate blocks, or divided by party-walls from the place of public resort. The author of selected design omitted to show thicker walls than 4½ in. This is perhaps one of the trivial objections. In drawing competition-plans thin walls may sometimes be inadvertently put in for thick party-walls. The want of sufficient and separate closets and conveniences properly ventilated is a more fatal objection. The inadequacy of exits communicating directly with the street, the use of winders in staircases, insufficiency of width of staircase landings as prescribed, the want of inclosure and support by brick walls to flights of steps, no gangways at side or rear of seating, non-compliance with rules as to internal doors not to obstruct when open, are serious objections to the acceptance of a design for a concert-hall. They are, in fact, the exact points which a referee would look to in making his decision as to the merits of a public hall or concert-room, because these details are extremely important in buildings of this class. A concert-hall is comparatively a simple subject of design. After its shape and proportions are decided, the questions of entrance and exit, means of communication with the street, and the levels of the different "circles" or galleries are urgent. These points would have lesser importance in buildings like public offices, blocks of residences or offices, schools, &c. In such buildings the arrangement of the departments, offices, or tenements would be the first consideration.

So, in short, the competent adjudicator on plans ought to be able to mentally decide on the leading points of each kind of building, and to make these the basis of his selection. For residential and office blocks, the location of rooms, their aspect and access from main entrances, light areas, and conveniences are of more importance than they are in buildings comprising one large unit like a concert hall or a public bath; in like manner the main points in the planning of a public school are the arrangement of its central hall and classrooms, lavatories, and cloak-rooms; a public library ought to be planned with special reference to a convenient location of the reading-room, lending library, and reference room; the entrance lobby and borrowers' space, means of supervision, &c., and so on with other buildings having a special use. In such a design as a concert-hall, so much depends on properties of easy hearing and resonance,

that it may be opportune to inquire whether acoustical planning should not be allowed to outweigh technical faults such as those we have enumerated? No doubt, in the eyes of a competent judge, it would go a long way towards atoning for defects of construction, and it may be difficult not to weigh a well-studied acoustical hall against technical points of entrance and exit if these would admit of amendment. He might also reasonably take into account any inventiveness of plan, so long as it could be embodied in the facts of the building. Such a thought leads us to the question of "style" or external treatment. Though, in the case of many buildings of a utilitarian character, subordinate, it cannot be abjured altogether. The "modelling" of masses must have a decided influence on a design—we mean the abstract massing of parts of the plan. A competent judge will allow this to weigh in his mind over other minor points. He will tacitly award merit for good proportion, outline, and details. These things, immaterial as they seem to the ordinary examiner of design, will exercise a certain weight in his decisions. With the men of hard-and-fast rule, the mere stickler for technical observance, these considerations have no place. On the other hand, he will look only at the merest commonplaces; the minor instructions will have more weight with him than those affecting design, and upon some little detail—as the position of a room or its dimensions—he will decide.

We are naturally led to these remarks by the results of recent decisions. The designs for the Soane Medallion represent much that is vague as well as thoughtful. We see several very ordinary and traditional examples of architecture as taught in the schools—one or two based on the principles of what is called the "new school," crude but clever, giving evidence of power, though in a direction by no means popular just yet. But how few are able to appreciate these newer elements of thought in competition, even when accompanied with fairly good plans. Their authors must wait for recognition.

## MODEL SPECIFICATIONS.—L.

GLAZIER.

IN specifying this trade, describe the quality of glass, the thickness of plate-glass, usually ½ in., or about, thick. The cheaper kinds of glass are usually taken first. Describe crown or sheet glass, weight per foot as 21oz. sheet, &c.; then describe rolled plate and thickness; rough plate for back doors, gratings, skylights, British polished plate, and describe the clear glass, the parts embossed or obscured. Lead-lights should be particularly specified, the borders, size, distance of saddle bars; but it is better to give drawing of any special kind, showing arrangement of borders, the shape and size of the panes, bars, &c.

Notes.—Sheet-glass is described according to its weight in ounces per foot, and these weights give the thicknesses. Thus, sheet-glass of 21oz. per superficial foot is one-tenth of an inch in thickness, 15oz. glass is one-fifteenth of an inch, 26oz. glass is one-ninth of an inch, and 32oz. glass one-seventh of an inch thick, and so on.

For first-class houses, the quality known as "best" is used, the next quality is "seconds," the ordinary glazing is done with "thirds." Fluted sheet-glass is corrugated, and is largely used for panels of back doors, closet windows, skylights, &c., the sizes in squares cut to order not exceeding 15sq.ft., the weights are 15oz., 21oz., 26oz., and 32oz. According to trade lists, the extreme lengths and widths made are given in the following table:—

	Extreme Length.	Extreme Width.	Area.
15oz.	60in.	40in.	15ft.
21oz.	90in.	50in.	26ft.
26oz.	90in.	50in.	25ft.
32in.	85in.	50in.	21ft.

The extreme limits of length and width cannot be combined in the same sheet, but the extreme area taken in connection with the length or width required in any case will indicate approximately the corresponding limit of width or length. (See tables given in price-books.)

Plate-glass, described generally of the following kinds, as—(1) Best British polished plate, distinguished by the spherical shape of the minute air-bubbles, made in three qualities, "ordinary glazing," "best glazing" and "silvering quality." (2) "Patent" plate with oval or irregular bubbles. It is thinner than British, and is adapted for air-tight show-cases, &c. The "second" quality, "C," is suitable for good glazing, and "C O" for ordinary glazing. It is obtained up to 50in. long, or 39in. wide and 13ft. in area. (3) Patent rough plate is of various thicknesses, the  $\frac{1}{4}$ in. patent rough plate is generally used where the width does not exceed 13in. and the length 60in. to 70in. It is useful for greenhouse roofs. The 3-16in. thickness is found to be sufficient for ordinary purposes. (4) Fluted rough-rolled plate, with corrugations or ribs, is a superior glass for skylights, doors, and windows. (5) Plain rolled plate, cut without reference to the flutes. (6) Rough-cast plate used for railway sheds and factories, the commonest quality of glass cast in sheets; the sides are wavy. It is the cheapest plate-glass, and made in  $\frac{1}{4}$ in.,  $\frac{3}{8}$ in.,  $\frac{1}{2}$ in.,  $\frac{3}{4}$ in., and 1in. thicknesses.

Rolled plate-glass,  $\frac{1}{4}$ in. to  $\frac{3}{4}$ in. thick, with fine lines on the surface, or fluted with larger ribs, can be had up to 10ft. square, or rough-cast plate,  $\frac{1}{4}$ in. and 1in. thick, cut to sizes and glazing in iron frames, with red-lead cement, may be specified. There are also rolled rough figured and pattern plate-glass, as Hartley's ribbed, very strong; the fluted are made in thicknesses of  $\frac{1}{4}$ in., 3-16in.,  $\frac{1}{2}$ in., and  $\frac{3}{4}$ in., and from 120in. to 42in. The "Luxfer" prism lens for electro-glazing into window plates, made in a large variety, is ribbed on one side (see sketch 5), and is a most valuable means of introducing light to darkened interiors.

Other kinds of glass are "ground," made in 16oz., 21oz., 26oz.; enamelled glass with parts obscured and with patterns; embossed glass made in patterns,—the sandblast is the cheapest, the acid process is the best—used for door panels, as in restaurants, &c., on plate and sheet glass; coloured glass, in sheet, muffled, or antique,  $\frac{1}{4}$ in. thick. The former has a wavy surface. In selecting coloured glass, care must be taken to describe particular kind. Some is only coloured on the face (flash glass), not throughout the thickness of glass, as in "cathedral" glass or "pot" metal. The "cathedral" glass is in several hues of no positive colour.

Leaded lights are now largely introduced for public buildings, commercial and domestic work, and are made of various patterns, or to design. Specify the size and distance apart of saddle-bars, the size of the lead "comes," usually about  $\frac{1}{4}$ in. wide, with grooves for the glass from 3-32in. to  $\frac{1}{4}$ in., and whether flat or rounded comes; also that the comes are to be secured by lead bands or copper wire to the saddle-bars. Comes are usually I-shaped in section, and  $\frac{1}{4}$ in. to  $\frac{1}{2}$ in. wide.

Pavement lights are made by Messrs. Hayward Brothers and Eckstein in various patterns (see prospectus), and should be selected from pattern book and specified.

In the best class of work, as to hall and vestibule doors, the glass is secured with wood mouldings screwed to bar or stiles (see sketch 1). The fillets or mouldings are placed inside. In specifying plate-glass in doors or shop-fronts it is necessary to state that the glass is to be bedded in wash-leather or vulcanised indiarubber; in large panes copper brads or sprigs are used to secure the glass before it is front puttied.

In glazing skylights the panes overlap, and when the glass is heavy, the tail of each should be hung to the head of that below by zinc or copper clips. To prevent leakage, the tails of the glass panes are generally rounded to throw off the water better.

**Glazing without Putty.**—Several ingenious methods of glazing for horticultural and other purposes are on the market. We illustrate Rendle's "Invincible" system, for squares up to 8ft. in length. The copper or zinc capping is screwed on to the water channel below, with side condensation gutters (section 3), the best method, also Rendle's "Acme" system (sketch 2) for squares up to 4ft. in length, showing the metal bar and metallic horizontal bar and mode of fixing. Sketch 3 shows another section of bar.

1. **Generally.**—All the glass to be of the best description, of their several kinds, clear, free from bubbles, scratches, and other defects, and to be well puttied and back-puttied and sprigged where required with stout copper sprigs; the glazing of door panels to be bedded in wash-leather and fixed with mouldings, and provide at the bottom of each square of glass in skylights two copper clips screwed with brass screws for fixing; the edges of plate glass to be blacked; the best oil putty to be used, and the glazing to be left clean and perfect.

2. **Sheet Glass.**—The glass, unless otherwise described, to be 21oz. "best" (or "seconds") sheet glass; or the sashes and casements on ground floors to be glazed with the best 21oz. sheet glass, and 16oz. sheet to the other windows.

3. **Rough Plate.**—Glaze the basement doors and windows with Hartley's rough plate glass  $\frac{1}{4}$ in. thick; glaze with 32oz. sheet glass the upper panels of hall or swing doors; glaze with Hartley's  $\frac{1}{4}$ in. small pattern fluted rolled plate the basement windows, &c. Or—

The basement windows to be glazed with 21oz. clear-fluted sheet, three flutes to the inch, vertical, with oil putty.

4. **Office Windows.**—The windows of offices to be glazed with second glazing quality 21oz. sheet-glass in oil putty.

5. **Rolled Plate.**—The bathroom, lavatory windows to be glazed with figured rolled glass in putty.

6. **Principal Windows.**—The windows of ground and first floors to be glazed with  $\frac{1}{4}$ in. British polished plate glass of "best" quality, fixed with mouldings.

Glaze the principal room windows with  $\frac{1}{4}$ in. full, British polished plate of the "best" quality, bedded in putty and wash-leather, or with beads screwed to frames.

(In specifying British polished plate, state quality—"ordinary," "best," or "silvering," and if  $\frac{1}{4}$ in., whether "full" or "bare." It is the most transparent glass.)

7. **Bevelled Plate.**—The vestibule doors to be glazed with  $\frac{1}{4}$ in. best British plate, bevelled and polished, bedded in putty and wash-leather.

8. **Iron Casements.**—Glaze the iron casements with 16oz. muffled sheet or other glass (if tinted, state the number of tints), well bedded in putty, and secured by screws.

Glaze the lantern over hall or staircase with the best 16oz. muffled sheet glass, curved to section, well bedded in putty.

9. **Leaded Lights in Casements.**—The casements to be glazed with leaded lights according to design, and to architect's satisfaction, with all necessary saddle-bars, clips, &c. Or—

The casement windows to be lead glazed to design, with stout lead lights, and muffled glass, in tints selected, with border of clear glass, fixed with stout copper wire bands to wrought-iron saddle-bars,  $\frac{1}{4}$ in. diameter, not exceeding 12in. (or 16in.) apart, bedded in white lead.

Provide the sum of — for leaded lights to design to casement windows and doors, including all necessary saddle-bars and fixing, to be supplied by Nicholls and Clarke, or Williams Bros. and Co., Wych-street.

10. **Leaded Lights to Shop Fronts, &c.**—The upper panels of shop front (or fanlight of door) to be glazed with 16oz. muffled sheet (or other glass) of approved tints, according to design, in  $\frac{1}{4}$ in. (or  $\frac{1}{2}$ in.) lead comes, sprigged, bedded in putty (or wash-leather), and fixed to woodwork by  $\frac{1}{4}$ in. saddle-bars, 18in. apart, with copper bands, to the satisfaction of architect. Or—

The small squares above shop-front (or in vestibule door panels) to be glazed according to design (or pattern of manufacturer), with 16oz. muffled tinted glass, in  $\frac{1}{4}$ in. (or  $\frac{1}{2}$ in.) lead comes, bedded in putty, sprigged, and secured by saddle-bars, 15in. apart, or the leaded lights to be supplied by Henry Hope, Birmingham.

(If fixed to stone mullion jambs, the leaded glazing ought to be run in with mastic cement.)

11. **Rough Plate Glass.**—The cellar or area grating to be glazed with rough cast plate-glass,  $\frac{1}{4}$ in. or  $\frac{1}{2}$ in. thick, in plates not above 9ft. super., properly bedded.

12. **Pavement Lights.**—Allow p.c. sum of — for pavement lights to cellar, to be supplied by Messrs. Hayward Bros. and Eckstein. Or—

The area of basement to be fitted with Messrs. Hayward Bros. and Eckstein's patent semi-prism and convex-lens pavement lights (No. 1), fixed in iron frame in cement. Or—

13. **"Luxfer" Prism Lights.**—Provide and fix on pavement level Hayward Bros. and Eckstein's "Luxfer" pavement prisms, fixed in iron frames, 6in. by 3in. centres; and to stall-board vertical prisms in plates 4in. square, in iron frame. The frames above transom of shop front to be glazed with "Luxfer" prisms, 4in. square, made with the proper angle of ribs to light the interior.

Glaze with electro-glazed "Luxfer" prism plates, of suitable angle, the front windows, according to directions of the manufacturers. Or, provide p.c. sum for same.

14. **Skylights.**—Glaze the skylights with  $\frac{1}{4}$ in. fluted rolled plate, small pattern; or the glazing to be fixed in patent lead glazing slips, securely fixed to bars with copper nails, and bedded on slips with thick white paint. Or—

15. **Lantern.**—Glaze the lantern lights (or skylights) with  $\frac{1}{4}$ in. or  $\frac{3}{8}$ in. rolled close ribbed plate, back puttied and sprigged with copper sprigs, the tails of sheets to have segmental cut laps  $\frac{1}{4}$ in., secured by copper clips.

16. **Conservatory Roof.**—Glaze the roof of conservatory with rough-cast plate  $\frac{1}{4}$ in. (or  $\frac{1}{2}$ in.) thick, or rough rolled fluted plate (or Hartley's rolled plate), with four or eleven flutes to the inch,

FURNITURE FROM HEAVITREE HOUSE, EXETER.

securely bedded, back puttied, and sprigged with copper sprigs. The sheets to be cut to point or curved at tail, and to lap  $\frac{1}{2}$  in. and secured by  $\frac{1}{2}$  in. copper or zinc clips. The vertical sides of conservatory to be glazed with the same or 21oz. Hartley sheet-glass, bedded in putty and sprigged with copper sprigs. Or—

17. *Patent Glazing to Roofs.*—The roof of conservatory to be glazed on an approved system, with metal or wood bars, zinc caps, water channels, and condensation grooves formed in the bars to the satisfaction of architect (or specify Braby's patent system of glazed roofing, with moulded wooden bars covered with zinc or copper, and the glass secured by weather-tight packing.) Or—

The roof of conservatory to be covered with Rendle's (Westminster) patent system, the "Invincible" glass roofing, with metal channel-bars of copper (or zinc) mounted on moulded wood core, with copper (or zinc) astragals, secured by screw-bolts, and condensation channels; or provide a p.c. sum for same.

#### FURNITURE FROM HEAVITREE HOUSE, EXETER.

THESE two interesting pieces of furniture come from the fine collection of the late Sir Clare Ford, G.C.B., for many years Ambassador at Rome. The Hall Table is 3ft. 9in. long, of oak. It is handsomely and boldly enriched, and inlaid at back; has one shelf, which is supported by two carved pillars. The Washstand is also of oak, having carved massive pillar supports and grotesque figures and pearl inlays at back. Both are in some ways uncommon pieces of furniture, and truly fine specimens of old English oak. They were recently disposed of by Mr. A. Bromley Sanders, of The Close, Exeter.

#### REPARATION OF NORWICH CATHEDRAL.

THE nave of Norwich Cathedral has now, says the *Norfolk News*, been closed for several months, during which time, thanks to the generosity of Mr. Samuel Hoare, M.P., and of Mrs. Hoare, a staff of skilful workmen has been busily engaged in unflaking the walls. Roughly speaking, about two-thirds of the operation have been completed, and some conception can be now formed of the great transformation that will be made when the whole of the work has been carried out. Several discoveries, which will be stated in detail, have been made, and they throw great light upon the ancient history of the building. Many of the colossal columns now stand cleared of the accumulated dirt and whitewash of

centuries, and the Norman setting of the early part of the 12th century is revealed for the first time for ages. In the south transept aisle, near the prior's door, some fragments of ancient colouring have been found. There are also traces of geometrical drawings on the arch near to the prior's door. On the columns opposite there are cuttings into the stone which correspond with similar cuttings in the same column at the lower bay. These are to be left as they are, for they point to the pre-existence of a series of small chapels long before the highly-decorated work in the glass screens was erected. There are a number of dowelled holes just here, and in the arcading on the south side of the same aisle the pillars are cut, evidently to make shelves in the recesses. Dowelled holes abound, some of them being filled with wood. These are to remain. It is hollow behind, and there is a larger recess in the vestry, and it would be extremely difficult to say what practical purpose either cavity served. The columns have suffered lower down from the erection of what was evidently a screen. Stones have been taken away, and their places supplied with bricks.

In the third bay westward from the prior's door the figure of a skeleton has been revealed. The hands are clasped upon the bare chest bones, and there are the following lines in ancient lettering:—

All you that do this place pass by,  
Remember death, for you must die.  
As you are now e'en so was I,  
And as I am so shall you be.

Where the feet of the skeleton would be are these two other lines:—

Thomas Gooding here do stave,  
Waiting for God's Ivdgment daye.

Several of the columns on the right of this were burst by fire long ago. These have all been repaired, for the principle upon which the Dean and Chapter have acted is that wherever destruction represented dilapidation that destruction should be made good; but wherever cavities in stones represent ancient history there the cavities will be allowed to remain. Over the arch between the third and fourth bays there are remains of circular paintings. The first appears to be that of a building, but it is not clear what the other two are. To the right of it there are two female figures, but the significance of the whole is not apparent. The colouring is still brilliant. In the next bay are the memorials of the Wodehouse family. The great fluted column presents some

extraordinary cavities. These are to be filled up within a couple of inches of their surface, so as to indicate to the observer that they once served some purpose. In this fluted column there is a perpendicular cutting about 4ft. in height. This also is to remain. Opposite to it, on the south side of the bay, there is great dilapidation, which has to be repaired. In the next column of the next bay dowelled holes abound, there being no less than thirteen, and these will also be left. In the arcading opposite these dowelled holes there are remains of geometrical colouring.

Perhaps the most interesting feature in connection with this great work is represented by Bishop Nix's chantry. At the side of the roof of the bay there are the well-known remains of the sacring bell. The chantry roof shows the arms of the see surmounted by a figure, probably of Bishop Nix himself. The centre of the roof contains a figure of the same bishop, with his pastoral staff, and there are highly coloured shields of the see, Bishop Nix's arms, and other ornaments of an heraldic character. Some of the cusps have suffered very much from the general maltreatment which is deplored by Bishop Hall in his "Hard Measure." The site of the altar in Bishop Nix's chapel has rendered the theory of the existence of a reredos over the altar almost indisputable, the side shafts of stone having evidently been cut away to admit of its insertion. The columns, when unflaked, revealed wedges of mortar driven into the holes once filled up by the supports of either wood or iron representing the ends of the grille. These will either be left as they are, or a different sort of stone will be inserted to mark the history. The second bay, occupied by Chancellor Spencer's tomb, contains some fine and delicate carving, which is all to be preserved.

Crossing the nave to the north aisle, there is nothing which calls for remark in the first two bays west of the south transept; but in the third bay and in the western column of the ante-choir on the north there are evidences that in days gone by there was a fluted column similar to the two that are known to everyone in the nave. This third fluted column seems to have suffered great destruction, and to have been covered round by a veneer of stone, under which lies what remains of the original fluting. It is proposed to cover this all round with glass, so as to preserve the discovery, rather than to destroy the history of the column by replacing the veneer of stone which has hitherto covered it. The rest of the bays in the north side seem not to have suffered anything like the dilapidation or the violence to which other parts of the cathedral

were exposed. But the Hobart monument, with its arms, &c., is very highly coloured, and the utmost care has been taken so that in cleaning it the colour should not be lessened, and still less removed.

The famous Green Yard door through which, in pre-Reformation times, the preaching monk went out to address the civic celebrities of this ancient borough has perplexed the Dean and Chapter not a little. Here, again, first principles were fallen back upon—not a vestige of the old work has been allowed to be touched: but all that could be done has been done so to clean it that no single instrument should be allowed to pass over it. In the second bay below the Green Yard door a fragment of mural painting beside the window in the same bay was discovered as recently as Monday, January 23rd. The discovery was at once reported to the foreman, and by him to the Dean, who ascended the scaffold, and ordered that the greatest care be taken to preserve all that remains of it.

Coming to the Lyhart screen, the panels of Dean Fellow's erection are to be pierced so as to give the organist a view of the choir in the nave when the large organ has been erected. This is the only point at which this erection will be interfered with, and not the slightest interference will be tolerated with respect to the Lyhart screen. The great point of interest in the nave centres around the two fluted columns. In the abacus of the fluted column on the north side there are indisputable evidences of the existence centuries since of a screen. There are openings in the abacus to receive its joints, and these correspond with great holes in the fluted column on the south side. There is hardly a doubt that long before the Lyhart period an earlier screen of this great Norman fabric stood between these two columns. Indications of fire in the reddened colour of the stones which were exposed to it abound. These, of course, remain, and nothing more can be done than to point the holes that have been made by dilapidations and the aridness of the mortar. In these deep holes, which are a foot square, one sees the solidity of Eborard's nave. It justifies the criticism of the late Mr. Ewan Christian, who when comparing Peterborough with Norwich Cathedral to the great disadvantage of the former, observed: "Nothing less than artillery will move Norwich." The core of these great columns is composed of flint grouted in cement, and is as hard as iron. Over the pulpit which the late Dean Goulburn presented to the nave, and which is carefully covered up during the work of reparation, there are several doweled holes. These suggest the position of a standing figure, or it may be of a painting in the panel behind the preacher, and for which the columns abutting upon it have been shortened. The panelled work in front of Bishop Nix's chantry, as well as in front of the bay in which Chancellor Spencer lies, is amongst the most beautiful revelations which Mr. Hoare's work has brought to light. The original painting is preserved, and each panel has its own distinct device.

It is an open secret that the Dean is considerably exercised as to the mode by which the great building should be lit. Up to the time that the reparation of the nave was taken in hand the fabric was covered by a whitewash coating, which in time, from age and smoke, became darkened and even filthy; but this coating served as a frock over the stone. This covering gone, the injury which the gas inflicted upon the covering will henceforth be inflicted on the stone, since there will be nothing to save it from the heat and smoke to which it will be exposed. A way out of the difficulty has not yet been found.

The Dean is full of confidence that the £1,000 required to complete the organ will be forthcoming.

The organ-blowing chamber will be on the north side of the cathedral. It is being built by Mr. T. Gill of Rupert-street, Norwich. Excavations have already been made to a depth of about 12ft.—the excavations are to go down to a total depth of 14ft., and there will be a 2ft. bedding of concrete—and the contractor has come upon a bed of very useful gravel, which is now being carted away for use in the Close. In two months the chamber will be ready for the reception of the Tangye's gas engine and cylindrical pumps which are to work the bellows of the new organ. The room and the engine will cost over £600. The organ case will be even more costly. The old case will be worked into the enlarged new one. The dimensions of the case are those of the organ,

and these may be gauged by the fact that the organ will occupy the whole of the gallery from the Lyhart screen on the west to the carved pinnacles over the stalls of the dean and vice-dean on the east. The cost of the case will certainly be over £700. It would be a graceful recognition of all the work the cathedral is now doing if some citizen presented the case. This would solve many difficulties. The name of the contractor for the organ case has not transpired, but rumour associates it with Messrs. Cornish and Gayner. They erected the Bishop Pelham Memorial Throne and the new stalls, and the Dean and Chapter have hitherto given all their work to local firms.

In all that has been done the Dean and Chapter have sought and received most valuable aid from Mr. W. H. St. John Hope and Dr. Bensly.

#### THE SUPERVISION AND REGULATION OF BUILDING OPERATIONS IN EDINBURGH.\*

BEFORE dealing with the jurisdiction and functions of the Dean of Guild Court of Edinburgh, as they exist at the present time, some short account of the origin and nature of the court may be of interest to you, as no similar tribunal exists in England. The Dean of Guild Court derives its name from the title of its President, the Dean, or Lord Dean, of Guild. The Dean is the head of the Guildry of the city, a corporation, or municipal body of great antiquity. The history of guilds is a very interesting study. From the earliest times merchants and skilled craftsmen have banded themselves together in these associations or unions for the preservation and promotion of manufacturing and trading interests. In Edinburgh the Guildry consisted of the merchants of the burgh, and as this corporation contained within it all the men of substance and standing in the burgh, they appear to have assumed or been vested with the power of regulating the public affairs of the community. For convenience their business was conducted and disputes were settled by the dean and a small council or committee, and in this way was originated the Court of the Dean of Guild. There existed at the same time other magistrates in the Lord Provost and bailies or bailiffs, corresponding to the Lord Mayor and aldermen of the English borough, who were appointed by the King to collect all rents and customs payable to the Crown, and who also exercised jurisdiction in criminal matters, and were responsible for the defence of the city—our friend, the enemy, in those days being usually the English; but the Court of the Dean of Guild had always an extensive jurisdiction in mercantile and maritime cases, and an exclusive jurisdiction in what are called cases of neighbourhood. Lord Erskine, one of the earliest and most famous of the Scots institutional writers, refers to an Act of the Scots Parliament of 1593, as

THE FIRST STATUTORY AUTHORITY FOR THE COURT;

but in 1584 the Dean of Guild Court of Edinburgh had already framed certain constitutions of by-laws for its guidance, section 3 of which enacts that the Dean of Guild and his council shall "bear the hail burden of deciding all questions of neighbourhood." These constitutions were ratified by an Act passed by the Scots Parliament in 1598, and from that date onwards the Dean of Guild of Edinburgh and his council or court seem to have exercised such jurisdiction. I have in my custody the minute book of the court, in a practically unbroken series from 1529 to the present day, in spite of the proclivities of the English, who had a most provoking habit of ransacking our archives and destroying our records in the course of their incursions. Dean of Guild Miller, who retired from office in November last, has in his book on the Edinburgh Dean of Guild Court, made a most interesting collection of decisions by the court in those early times, showing the varied nature of its judicial functions. With the advance of the times, which brought with it the institution of popularly elected town councils, and the establishment of properly constituted legal tribunals for the disposal of all civil cases, the Dean of Guild was gradually stripped of his powers, and his jurisdiction was narrowed down to "regulating building within burgh,

whether in repairing, or taking down and rebuilding old buildings, or erecting new ones," and these practically are the functions of the court to-day. The Guildry still survives, and the members annually elect the Dean of Guild; but here, I think, its public duties cease. The qualification for a guild brother, as a member of the Guildry is called, is that he has been in business in the city for one year, or has been a householder and paid rates and taxes for three years, and his election costs him one guinea. The Dean of Guild is *ex officio* a member of the town council. This short account of the origin of the court will show that when the powers and duties of the court came to be defined by statute, which occurred in 1879, the court had already by usage and precedent acquired a jurisdiction at common law which was reaffirmed in such charter granted by the court to the Borough of Edinburgh, and was explicitly recognised by the judges in the Supreme Courts. This brings us now to 1879, when the court was constituted in its present form.

#### THE EDINBURGH MUNICIPAL AND POLICE ACT

of that year enacts thus: From and after the first Friday following the election of councillors in the month of November, 1879, the Dean of Guild Court, as at present constituted, shall cease and determine, and shall on and after that date consist of the Dean of Guild, appointed by the Guildry of the city, as use is, and of ten members then and at the corresponding date in each succeeding year to be appointed by the magistrates and council, five of the said members being councillors and the other five registered electors of the city not being councillors, and of whom three shall be persons carrying on, or who have carried on, business as architects, civil engineers, ordained surveyors, or master builders, and three members of the court, with or without the Dean of Guild, who, when present shall preside, shall form a quorum; and the said court shall have power from time to time to appoint one of their number to preside and act in the court in (as interim Dean of Guild) the absence of the Dean of Guild and such Court, as so constituted shall possess and exercise within the burgh, all the rights, powers, privileges, functions and jurisdictions which are possessed and exercised by the existing Dean of Guild Court, by law or usage, within the limits of its present jurisdiction, which are not inconsistent with and which are by this Act conferred," so that you see when the court was reconstituted care was taken to preserve to it all its inherited and common-law powers. You will also observe that the Act prescribes that three at least of the members of the court must be architects, civil engineers, ordained surveyors, or master builders; but, as a matter of fact, the importance of securing that this court shall be one composed of practical men is so well recognised in the town council that the proportion of these is always much higher than the law requires. For instance, the present Dean of Guild is an ordained surveyor, and of the ten members of his court there is one architect, one civil engineer, four master builders, one plumber and sanitary engineer, two house and property agents, and a marble merchant. Some of these gentlemen are retired, but the majority are in business, and all are men of standing in their various professions and callings, and of repute as citizens. So much has the practical nature of the court impressed itself on the judges in our Supreme Courts, that in a recent appeal against a judgment of the Dean of Guild Court dealing with a practical point, the judges, in dismissing the appeal, put it upon record that "they will be slow to interfere in a matter of this sort with the decision of the Dean of Guild and his council, who are practical men, skilled and experienced in the building trade and other trades connected therewith." Of course, if, as sometimes happens, a member of the court is in any way interested in a petition before the court, he must withdraw during the consideration of the case. While the court, however, is more particularly fitted to deal with the practical aspect of the cases which come before it, it may competently, and does constantly, decide the legal questions which may arise in these cases. Obviously, in cases of neighbourhood, intricate questions arise, involving the construction of titles and the application of the law of servitudes; but in dealing with the legal aspect of a case, the court is advised by its legal assessor, who is always a member of the Bar—an advocate, as he is called in Scotland, the equivalent of your

\* Abstract of a paper read before the Society of Architects on Thursday, Jan. 28, 1899, by DAVID LYON, Clerk to the Edinburgh Dean of Guild Court.

barrister. Only on one point has the court no jurisdiction, and that is when a conflict of title arises—when two parties produce titles apparently applying to the same property. In such an event the Dean of Guild Court must delay the disposal of the petition until the right of property has been decided in a competent court. Although the members of the Dean of Guild Court, with the exception of the dean himself, are now elected by the town council, and five of the ten are members of the council, the court is wholly independent of the council, while the council is made a party in all proceedings before the courts. Its position is the same as that of any other party, neither more nor less.

#### THE OFFICIALS OF THE COURT

consist of the master of works, the procurator fiscal, and the clerk. The functions of the master of works are to report to the court upon all plans lodged with petitions, and to see that the orders made by the court are duly executed, and from time to time to inspect the works in progress in execution of plans for which warrant has been given by the court; also to report to the procurator fiscal any deviation therefrom. He is prohibited from engaging, directly or indirectly, in any service or employment connected with the professions of architect, civil engineer, or surveyor, or from being connected directly or indirectly with or interested in any contract or works belonging to any branch of the building trades. He, of course, has a staff of inspectors to assist him in his work. I may state that the master of works in Edinburgh is also the burgh engineer, and the combination of the two offices has been found of immense advantage in the supervision and inspection of work authorised by the court, and in the detection of unauthorised building operations. This combination has the further recommendation of preventing the friction and overlapping occasioned by two officials with distinct staffs of assistants engaged in work very similar in character. Both systems have been tried in Edinburgh, for in 1879 an independent master of works was appointed; but in a few years the friction and overlapping to which I have referred became so apparent that the offices were conjoined with the most satisfactory results. The next official is the procurator fiscal or public prosecutor. His duty is to take proceedings against any person contravening the law by building without a warrant, or deviating from the plans in conformity with which any warranty of court has been granted, also against the proprietors of a ruinous or dangerous building or structure to have the same taken down or secured, and generally it is at his instance that all offenders against the Dean of Guild Court Law are brought before the court. He is called the procurator fiscal for the public interest, and he represents, as his designation suggests, the interests of the public in the enforcement of the law. This, I may tell you, is the practice in all Scots courts, and you will permit me to say that it is one which might with advantage be adopted in England. In Scotland all prosecutions proceed at the instance of a public prosecutor. Lastly, there is the Clerk of Court, who is expected to guide the court in matters of procedure. He has always to keep a record and minutes of all proceedings before the court, including an index open to the public of all warrants granted by the court. He is charged with the safe custody of all plans passed by the court, which remain permanently in the possession of the court for reference. While this is, of course, necessary for the purposes of the court, it is, at the same time, of great public convenience. I need hardly say that petitioners do not lodge their principal plans, but only tracings. Having explained the constitution of the court and enumerated the officials, I purpose now to deal with

#### THE CLASS OF CASES SUBMITTED TO THE COURT

with the method of their disposal. The section of the Act prescribing the operations in respect of which a warrant of court is necessary, is as follows:—"Every person who proposes to erect any house or building, or to alter the structure of any existing house or building, or to use for human habitation any existing house or building which had not been previously used for that purpose, or to alter the mode of occupancy of any existing house in such a manner as to increase the number of separate houses or occupiers, shall lodge with the clerk or Dean of Guild Court a petition for warrant so to do, and such petition shall set forth a description of the intended house, or building,

or alteration, and shall be accompanied by a plan of the site showing the immediately contiguous properties, and also the position and width and name of any street, court, foot pavement, or footpath from which the property has access, or upon which it abuts; and also plans, sections, elevations, and such detailed drawings as are necessary to show the height and mode of structure and arrangement of the intended house, or building, or alteration, and the lines of the intended drainage thereof, and the levels thereof relatively to the street, court, foot pavement, or footpath, and to the sewer or drain, and where the soil-pipes and drains of the property to be built or altered are intended to be connected; and in regard to any building intended as a place of public resort, such plans shall show the arrangements for ventilation and heating, and the provision intended to be made for ingress and egress; and all plans to be lodged as aforesaid shall be drawn to a scale of not less than one and one-quarter inch to every 10 ft., except plans of the site, which may be to a scale of not less than one-fourth of that of the other plans; and such petition, plans, and sections, with such alterations thereon as may be made as after provided, shall be registered and indexed by the clerk of the Dean of Guild Court; and the said petition, plans, and sections and register and index shall be open to inspection by any owner or ratepayer upon payment of a fee of 1s. Provided always that the Dean of Guild Court, on a written application may, in the case of any alterations of any house or building which do not affect the property or the rights of other owners, and which, in the opinion of the Dean of Guild Court, are of minor importance and extent, remit such application forthwith with such instructions as they think fit, to the master of works, who may thereupon grant warrant for the execution of such alterations, and which warrant shall have the effect in all respects of a warrant of the Dean of Guild Court, and be subject to the provisions of this Act in the same way as if such warrant had been granted by the Dean of Guild Court, and all such alterations shall be executed to the satisfaction of the master of works, who shall make a report to the Dean of Guild Court." To this section an addition was made requiring that all plans shall set forth thereon the material proposed to be used in the construction of the elevations of any house or building, and prohibiting any person from building, altering, or rebuilding any house or building until the approval of such material has been given by the court. A warrant of court is also now necessary for excavations intended to be made for and in connection with houses or buildings intended to be erected. I wish more particularly to direct your attention to the clause dealing with the material to be used in the elevations of buildings, because it makes an advance on the primary function of the court, which is to secure sufficiency of structure.

#### THE POWER TO CONTROL THE MATERIAL USED

in the elevations may be said to go beyond mere considerations of stability and security, and to confer on the court a discretion which will, to a certain extent, entitle it to be reckoned with as a court of taste, because, as far as stability is concerned, a building may be equally well constructed of stone, brick, and cement, iron, or wood, or of a combination of any of those materials. In Edinburgh we are proud of our picturesque city, and there is a strong bias in favour of the use of stone—at least, in the elevations of our buildings—along with a desire to secure some measure of architectural feature in their appearance, so that when some more than usually plain or ugly building is erected, the desire is often publicly expressed that the Dean of Guild Court should have the power to consider the architectural character of the plans submitted to it. Now, while we are generally agreed that this would be desirable, and while the court does as far as possible use its influence in the direction of persuading the speculative builder and utilitarian to spend a little money on architectural feature and decoration, we have to recognise that a prosaic legislature will not give to any court or local authority the power to dictate to the individual in such matters. I suppose this is inevitable, because it does seem inequitable to compel any private individual to erect beautiful but probably unremunerative structures for the public delectation, and also because we must admit the force of the maxim that there is no disputing a matter of taste, and on a question so exclusive and so personal we can never hope to have unanimity

of opinion. We may be assured, then, that the Dean of Guild Court will never be a court of taste in this sense, and this power, even of controlling the material of elevations, is one which, I am satisfied, it will not be permitted to exercise arbitrarily; but, so far as reasonable men may endeavour to preserve amenity and congruity without entailing undue expense on the owners of property, to that length, I believe, the action of the court will be sustained. There is also a proviso in the section of the Act just read which deals with warrants for

#### ALTERATIONS OF MINOR IMPORTANCE

and extent, and which was inserted for the following reason: It was urged that in a large number of cases the alterations proposed, although they were structural, were of such a trivial character that it seemed a hardship to insist on the proprietor of the property being put to the trouble and expense of presenting a petition in the ordinary way to the court. Accordingly this proviso was inserted, allowing a person in such a case to lodge a simple sketch, accompanied by an explanatory letter, and so obtain the sanction of the court without incurring much expense or loss of time. This advantage has been readily taken advantage of, with the result that a class of case which occasioned much trouble to the court and its officials through the difficulty of deciding whether or not it came within the scope of the Act of Parliament, has been provided for in such a simple way that people have freely availed themselves of the facilities thus afforded them for obtaining the sanction of the court, and very few even of the most unimportant alterations are carried out without this sanction.

(To be continued.)

#### THE SOCIETY OF ARCHITECTS.

THE third ordinary meeting of the Society of Architects was held at St. James's Hall, Piccadilly, W., on Thursday in last week, the President, Mr. Walter Emden, J.P., L.C.C., in the chair. Two nominations for membership were read and approved.

#### THE SUPERVISION AND REGULATION OF BUILDING OPERATIONS IN EDINBURGH.

A paper on this subject was read by Mr. DAVID LYON, the clerk of the Dean of Guild Court in Edinburgh, and is reported on preceding page.

In proposing a vote of thanks to Mr. Lyon, Mr. J. R. MANNING remarked that in Edinburgh the officials seemed to have the confidence of the citizens; whereas in London they were looked upon by the public as their natural enemies. In Edinburgh the service of notices on adjoining owners was done by the officials rather than by the architect, and he thought that would be a decided improvement if the same could be done in London, as it would relieve both architects and builders of much trouble.

Mr. HENRY LOVEGROVE observed that Edinburgh was, of course, a very small place, not much larger than the district of Shoreditch, which he managed all by himself, and he considered that the arrangements of the Dean of Guild Court of that city were extraordinarily elaborate. The Guild Court seemed in some respects to resemble the Building Act Committee of the London County Council. He wished to second the vote of thanks.

Mr. WILLIAMS, solicitor, remarked that the supervision of building operations in Edinburgh was much better than in London—it was cheaper because expert evidence was avoided, and quicker because the Guildry Court ascertained for themselves the facts of each case. In London a great amount of money was unnecessarily expended in settling cases of dispute. The Dean of Guild Court also enforced its own decisions—another point in which Edinburgh was in advance of London. The system which prevailed in Edinburgh might well be copied in the Metropolis, where we had the germ of something of the kind in the new Tribunal of Appeal.

Mr. ELLIS MARSLAND, hon. secretary, said the paper had been brought forward at an opportune moment when the question of the supervision of buildings was before the minds of the public and of the London County Council. Personally, he was far from agreeing with the whole of the proceedings of the Dean of Guild Court, the great charm of which was that it was composed of practical men. If they had in London a court similar to the Guildry, it could deal with questions

of light and air, which, if brought before practical men, could be settled cheaply and quickly.

Mr. PERCY HUNTER, District Surveyor of Lower Norwood, pointed out that the difference between the methods of supervision employed in England and Scotland hinged on the system of land tenure, for in Scotland there was no such thing as leasehold property as the term was understood here. If it were possible in England to confine building to freehold land, they could soon do away with the necessity for district surveyors.

The President had been much struck with the simplicity of the Scottish system of supervising building operations, one which spoke volumes for the practical sense of our Scottish neighbours. He believed we might with advantage incorporate some of the Scotch building laws, especially those dealing with light and air, into our existing code. The Society of Architects had recently presented a petition to the Lord Chancellor on the subject, and a motion he had brought before the London County Council had only been lost by an equality of votes.

Mr. LYON, in responding to the vote of thanks, which was carried by acclamation, thought it was quite hopeless that they could think of altering the institutions of England, the laws of the two countries were so different. The Dean of Guild regulations applied all over Scotland. Edinburgh was better off than Glasgow, because in the latter place the Dean of Guild court was not so closely in contact with the town council. They had in Scotland no real building laws, but only building rules, which did not deal with plans, but only with materials and the manner of building. The President of the Dean of Guild Court was elected annually, and received no salary. The question of appeal was the great weakness in the London system. In Edinburgh the cases were settled direct by the court in the first instance, and very few cases ever went beyond the court.

#### INSTITUTION OF SURVEYORS.

##### STUDENTS' PRELIMINARY EXAMINATION.

OF the candidates who presented themselves at the Preliminary Examination of the Institution, held concurrently in London, Manchester, and Dublin on the 18th and 19th inst., the following satisfied the examiners:—

Lawrence Haynes Adams, 1, Southdown Villas, Burgess Hill, Sussex; Paul Adams, Woodville, Beckenham-grove, Shortlands, Kent; Leslie Herbert Allen, 4, Hawkwood Mount, Springfield, Upper Clapton, N.E.; Henry Anderson, Uplands, St. Julian's-road, Streatham, S.W.; Arnold Edwin Bare, 64, Lebanon-gardens, West Hill, Wandsworth, S.W.; Charles Russell Barker, 4, Park-crescent, Portland-place, W.; Herbert Graham Barker, 2, St. Paul's-square, Bedford; Norman Boniface Batterbury, Berkhamstead, Herts; Albert Henry Bell, Woburn Lodge, Addlestone, Surrey; John Ingham Benson, The College of Agriculture, Downton, Wilts; Alfred Norman Blake, Maisonnnette, Willis-road, Gosport, Hants; Harold King Blyth, Reinvile, 30, Cotham Vale, Cotham, Bristol; Berttram Alfred Boyton, The Retreat, Church-row, Fulham, S.W.; Reginald Woodhouse Brealey, Rose Bank, Leek, Staffordshire; Sydney Browning, 12, Beaufort-road, Clifton, Bristol; William John Carter, Glaslyn, Chatsworth-road, Brighton; Cuthbert Harvey Clark, 18, Palace Garden Mansions, W.; Cyril John Clements, Stratford House, Mildenhall, Suffolk; Harry Reginald Ellis Coker, 2, Hillsboro'-road, East Dulwich-grove, Dulwich, S.E.; Frederick Stanley Daniell, 13, Lexted-road, Colchester, Essex; William Robert Davidge, "Hopetown," Teddington Park-road, Teddington; James George Morris Davies, Troy House, Rugby, Warwickshire; Richard Harold Demuth, Leek Wootton, Warwick; John Boon Densham, Olden Lodge, Purley, Surrey; Conrad Hugh Dinwiddy, 12, Croom's-hill, Greenwich, S.E.; Harold James Dodd, The Glebe, Goring-on-Thames; John Robert Farrant Driver, 74, Burleigh-street, Cambridge; Douglas Howard Eldridge, "The Rhespas," Mount View-road, Crouch Hill, N.; Stewart Frank Haywood Farmer, 98, New-street, Birmingham; Charles Fishwick, Waterloo House, Wellington-road, Hastings; Harold Vernon Fletcher, Penshurst Park, Tonbridge, Kent; Ronald Garnham Francis, Stour-street, Sudbury, Suffolk; Thomas Goodgames, The Limes, Eaton Socon, St. Neot's, Hunts; Harold Hanson, Holmwood, Edgerton, Huddersfield; Harold Croft Hardy, 8, Morella-road, Wandsworth Common, S.W.; Ronald Hartley, the College of Agriculture, Aspatria, Carlisle; Herbert George Heal, "Arnewood," 9, Nelson-road, Southsea, Hants; Richard Hewett, Whitelane Farm, Seale, near Farnham, Surrey; Fred. Hill, Bridge Inn, Free Town, Bury, Lancashire; William Harold Hillyer, "Knockholt," Ravensbourne Park, Catford, S.E.; Richard Valentine Hitchings, Downham, Rectory-place, Guildford; Robert Cecil Holbeche, 21, Bennett's Hill, Birmingham; Philip Lewis Hopkin, James-street, Pontardawe, near Swansea, South Wales; Richard Brown Hopkinson, Laurence Dene, Edgerton, Huddersfield; Frank Vivian How, West Cottage, Asylum-road, Lincoln; Arthur Burnaby Howes, 193, High-road, Balham, S.W.; Lloyd Unsworth Hubble, The Elms, Hunton, Maidstone, Kent; George Pitron Inley, Old Studley House, Wimbome-road, Bournemouth; Richard Stephens Jackson, 117, High-street, Sittingbourne, Kent; Reginald Charles James, "Treeriffe," Ringwood-road, Poole, Dorset; William Howard Rigden Jarvis, West Tarring, Worthing,

Sussex; Francis Wilson Jeffery, 77, St. Helen's-road, Hastings, Sussex; Arthur William Johnson, Woodland House, Manor-road, Barnet; Ronald Henry Kaines, Milton, Gillingham, Dorset; Leonard Needham Knox, 19, Bryanston Mansions, York-street, W.; Ralph Julian Lake, Heage House, Crouch Hill, N.; Harold Minton Leach, 32, Upper Richmond-road, East Putney, S.W.; Randle Bursall Lees, 99, Antrobus-street, Congleton, Cheshire; Edward Llewellyn Lewis, 21, Ranelagh-road, Westbourne-square, W.; Sydney Evan Lowsley, 3, Rectory-terrace, New Hampton-road, Wolverhampton; Trice Martin, 109, West-street, Farnham, Surrey; \*Arthur Whistler Neate, Speenhamland, Newbury, Berks; Leslie Richard Notley, Larkfield, Englefield Green, Staines; William Henry Overton, 6, Compton-avenue, Brighton; Sydney Arthur Parnwell, 68 Colveston-crescent, Dalston, N.; Maurice Harry Donne Parsons, Rosemount, Exeter, Devon; John Patten, jun., Park Farm, Alnwick, Northumberland; Dan Ward Perkin, Gulworthy, Tavistock, Devon; Charles Fearnall Perkins, Englehome, Sea-road, Boscombe, Hants; Philip Septimus Pitt, 53, Bateman-street, Cambridge; Albert Edward Priest, Hornedale, Old Hill, Staffordshire; Harold de Lisle Reaney, 11, Upham Park-road, Chiswick, W.; Charles Cecil Reed, Beeford-grange, Beeford, near Hull, Yorks; Edward Reed, Downlands, Rottingdean, Sussex; Ernest Charles Richardson, Stamford, Lincolnshire; Arthur Henry Rippengal, 19, Cameron-road, Croydon; Josslyn Alleyne Robinson, Market-square, Kirkby Lonsdale, Westmoreland; George Armstrong Rowlandson, 1, Richardson-street, Carlisle; Humphrey Gladstone Russell, Boyle Cottage, Thames Ditton, Surrey; Sidney Rupert Sackett, Wingfield House, Orsett, Essex; Ernest Arthur Scollick, 3, Church-road Villas, Burgess Hill, Sussex; Herbert Douglas Short, Saham Toney Rectory, Watton, Norfolk; James Harcourt Slade, West Lodge, Upminster, Essex; Henry Richard George Strong Smallman, Stanstead, Sutton, Surrey; Douglas Henry Smith, 7, Marine-avenue, Westcliff, Southend-on-Sea; Stanley Addison Smith, "Sunnyside," Monkseaton, Newcastle-on-Tyne; Warwick Hughesdon Smith, 150, Eastgate, Rochester, Kent; Thomas William Smyth, 82, High-street, Barnstaple, Devon; Arthur Perry Stockings, Rowan House, Cheshunt, Herts; Frederic Stone, The Horwells, St. Stephens, Launceston, Cornwall; Samuel Davis Taylor, Packington House, Ashby-de-la-Zouch; Edgar Guy Temple, Fraser House, Margery Park-road, Forest Gate, E.; William Thompson, 8, Cavendish-place, Carlisle, Cumberland; Francis Ferrier Tomlin, 49, Lordship-lane, Wood Green, N.; Frank Ward, 47, Cowley-road, Leytonstone, E.; Alexander Lindsay Watt, The Agricultural College, Aspatria, Carlisle; Arthur Daniel Moutray Webber, University College, Bangor, N. Wales; William John Walter Westlake, 33, Cobourg-street, Plymouth, Devon; Percy Hamilton Wharton, 35, Kent House-road, Beckenham, Kent; John William Edden White, 4, Calverley-terrace, Tunbridge Wells, Kent; Ernest Mortimer Whitehead, 28A, Old Bond-street, W.; John Layard Whythead, The Vicarage, Warminster, Wilts; Clement Wilks, 15, St. Mary's-road, Highbury, N.; Harry Russell Willmott, Spital House, Chesterfield, Derbyshire; Hugh Miller Wilson, One Ash, Kettering, Northamptonshire; John Guy Wood, Elmwood, Upper Warrington, Surrey; Rowland Harry Wood, 4, Worthing-road, Horsham, Sussex; Francis Wright, Danbury, Chelmsford, Essex; Charles Alexander Young, 167, Brixton-road, S.W. \* Passed at head of list.

IRISH CANDIDATES.—Reginald Hume Townsend Gahan, 6, Kenilworth-square, Rathgar, Co. Dublin; Robert Beresford Gahan, Beverston, Dundrum, Co. Dublin; John Talbot Goff, Clonara, Killybeg, Co. Dublin.

#### TIMBER SEASONING BY ELECTRICITY.

FROM the earliest times, one of the chief problems for users of wood has been to obtain an adequate supply of thoroughly seasoned timber, the process of natural seasoning taking from three to five years. This difficulty is now claimed to have been solved by the application of the Nodon-Bretonneau process, a company whose operations have been carried on in France for some months with much success, and who are just introducing the system into England, having, at present, a model plant in full working order at the works of Messrs. Johnson and Phillips, at Charlton. The process involves the total expulsion of the sap, and its replacement by a solid resinous matter, which is accomplished by placing the wood flat in a vat containing a solution of borax 10 per cent., rosin 5 per cent., and carbonate of soda  $\frac{1}{2}$  per cent., which is kept by a heated coil to a temperature of about 80°. The lower part alone sinks into the solution. An electric current, under the necessary difference of potential, crosses the thickness of the wood, enters a lower positive pole and a higher negative pole placed in a porous vase full of water. By the action of the current, the solution is sucked from the bottom to the top and permeates the whole mass of wood by *electro-capillary attraction*. The displaced sap rises to the surface of the bath, and such treatment lasts from six to eight hours. The wood is then dried in the ordinary way, in summer a fortnight in the open being sufficient, in winter by the aid of a stove heated by steam coal, about five days being only necessary.

It is claimed that by this process many woods hitherto unworkable can now be used, and specimens of many varieties are shown, including mahogany, teak, pine, *grisard* (a French wood almost unusable in the ordinary way), and a piece of maritime pine, cut and seasoned in eighteen days, including transport.

The process causes the seasoning to be thoroughly accomplished—whether the wood be hard or soft—renders it impervious to moisture, and preserves it from decay. It further enables the staining of timber (to any desired colour) to be carried right through its thickness, and experiments are being instituted whereby it is hoped to also render it non-igniferous.

#### THE BOOK OF FIREPLACES.

THIS is a well-illustrated catalogue of fireplaces issued by Messrs. Alex. Boyd and Sons, of the Boyd Works and Showrooms, 105, New Bond-street, W. The designs shown vary in price, ranging from 10s. to £500, and illustrate the decorative section of this firm. Some useful information will be found in the introductory pages. Messrs. Boyd and Son adopt the best English and American systems of warming. For warming private houses a list of points are given to be answered which will enable the firm to advise as to the kind of fireplace or other means of warming required. The designs represent various styles. The first is a Gothic fireplace, "Cardiff Castle," with the lining of bas-relief iron and with polished iron and brass dogs, the basket being available for coal or wood. The width is 4ft. 6in., size of fire 1ft. 11in., and price £24. Another, a Renaissance fireplace, is with upper part of rich carved wood, and figures of statuary marble. The fireplace has brass dogs copied from a Florentine example. "A Tudor Fireplace," "Hatfield House," is also of bas-relief iron lining of ornamental panel-work, with fuel basket. The design is simply treated, and the chimney-piece is of carved wood, with marble. Other examples represent grates in polished iron and brass enrichments in the Louis XV., Louis XVI., Italian, and other designs; these are chiefly register grates with tiled jambs and friezes, fire-lump bodies, some with canopies, and of moderate price. A hob-grate in black iron, designed after an 18th-century type, and with brass mouldings and firebrick back, and other Old English and Louis XV. patterns, dog-grates, and basket-grates, independent of the opening, are illustrated. We recommend these designs to all who desire to introduce artistic grates and fireplaces.

#### A HILLSIDE HOUSE.

THIS drawing shows the garden front of a house to be erected on a site situate on the slope of a hill. The materials are stone and stucco, with timber-framed gables and tiled roofs. The ground plan includes entrance-hall, dining-room, drawing-room, morning-room, servants' hall, pantry, servery, &c. The kitchen and offices are in the basement. On the first floor are studio, four bedrooms, dressing-room, bath-room, w.c., &c. Mr. Percy Robinson, of Leeds, is the architect.

#### BUILDERS' TENDERS.

UNDER the auspices of the Huddersfield Master Builders' Association, a lecture was delivered at the Builders' Exchange, Huddersfield, on Tuesday week, by Mr. James Townsley, of Hull, general secretary of the National Association of Slate Merchants and Slaters, on "The lowest or any tenders not necessarily accepted." Mr. Alderman B. Stocks presided, and was supported by Mr. John Dawson.

Mr. Townsley said he thought he could fairly claim to have selected a familiar text from which to speak, for what contractor throughout the country, be he large or small, had not read over and over again the mystical words, "The lowest or any tender not necessarily accepted?" Probably the older or more experienced of the fraternity had long since placed upon them their true worth, and it would not be a matter of great surprise if they had entirely overlooked them. The experienced contractor notices only the essentials of the contract, namely:—The work to be done, the date on which tenders are to be sent in, and the architect's name, and certainly to those who were well versed in the rudiments of contracting, nothing further need be noticed. But to the young and inexperienced builder, actuated by a righteous ambition, the words have a charm, they become an allurements to which he sooner or later yields, and, in yielding, he often becomes a thorn in the side of the more matured contractor,

## A HILLSIDE HOUSE.

PERCY ROBINSON ARCHT

Sketch Plan

who, having won his spurs by years of struggling and costly experiment, feels a sense of injustice in making up a tender against those whom he feels are not fully qualified to do so. The architect often defended the position by stating that the clause itself very largely tended to retard small men from tendering, inasmuch as it was an intimation that such as had little experience, or lacked the necessary essentials, had a very remote chance of success; but it did not require a wiseacre to tell them how often other than the lowest estimate was accepted. It was this knowledge that induced the young builder to attempt contracting; he was influenced very largely by this clause, which is invariably found in advertisements. The lecturer himself had often been approached by young bricklayers and joiners about contracting and their probable chance of

success, and they had almost invariably drawn his attention to the clause with which they were dealing. The results unfortunately too often revealed the folly of such early efforts, for it required years of probation before one could hope to become a successful contractor. To secure work either by reckless tendering or from ignorance engendered by a lack of experience, not only injured the unfortunate contractor, but prevented another man from securing work at a fair profit. He failed to see the necessity for the clause at all. It was misleading, very often ludicrous, and served no useful purpose. It had no legal value, as Hudson on the law of building, states that "whilst it is usual to announce that the building owner does not bind himself to accept the lowest or any tender, such reservation is only an excess of caution, for advertising for

or inviting tenders is a mere attempt to ascertain whether an offer can be obtained within such a margin as the building owner is willing to adopt, a mere offer to negotiate with the persons who reply to the advertisement." Undoubtedly an architect's first duty was to his client, and in considering estimates he must also consider the class of work required to be done, and whether the contractors are able, in his opinion, to fully carry out the work. He was therefore of opinion that in regard to publicly advertised work the lowest estimate sent in ought not necessarily to be accepted, but on turning to estimates which were privately invited, a much different aspect presented itself. The architect then selected men in whom he had fullest confidence, and thus every competitor was on an equality, and gross injustice was done if the lowest tender was not

then accepted, unless such tender was obviously the result of some error. A misuse had been made of these contracts in some cases, but since the inauguration of master builders' associations, builders' federations, exchanges, and the like, there had been less opportunity of transgressing the laws of honour in this way. Corporate and public bodies had not been guiltless in the matter; but they had often sheltered themselves by saying they were not spending their own but the public money. Contractors must not, however, set themselves up as an immaculate body, and they must remember that by honest criticism reforms would be brought about. Commenting upon the fact of borough engineers or architects estimating the cost of a proposed building or improvement, he thought it was too often the case that the figures set forth by that official were held to be the extent to which the contractor must go. It should be borne in mind that that was only an approximate and not an actual estimate; these gentlemen were not contractors, and were not able to follow the fluctuations of the market or grasp the difficulties of the labour element as those who were in constant touch with them. He asked why should contractors be called upon to give an estimate at all? Could not they, as contractors, be trusted to execute an order and charge honestly for time and material? Why could not the work be done as cheaply by the day as by contract? He went on to speak of the importance of builders' associations and federations, and said that organisations were springing up like mushrooms, and amongst the members a more brotherly spirit was being engendered—a spirit of protection and justice for all who were associated with their work. In conclusion, he urged them to strive to turn out, if possible, better work, and to gain the fullest confidence of everybody interested in their trade, so as to render obsolete the term, "The lowest or any tender not necessarily accepted."

In the course of a discussion which followed, Mr. Lewis Radcliffe characterised the suggestion of the lecturer of submitting monthly or weekly statements of work done whilst a job was being proceeded with as an admirable one. There was often much difficulty in an 18 months' or two years' bill to get the architect to remember the several points in the bill. Mr. F. Milan agreed that when contractors were selected it should be the invariable rule that the lowest tender should be accepted, for to put contractors to the trouble of getting out estimates when a selection had already been made was altogether unfair to them. Mr. Graham, alluding to the question of day-work, said that many contractors preferred that system instead of having the work by contract, and it was better in some cases to have the work done in that way. Mr. John Dawson remarked that contracting was legitimate in itself, but it was sometimes overdone, for people, when they had only a 5s. job to be done, wanted to know what the cost would be. He emphasised the fact that a more kindly feeling towards each other existed among contractors than there used to be, and that would not tend to any unfair treatment of the public or anyone, for he was sure they did not want to take advantage of either architects or the persons concerned in the outlay for any building operations. What builders in general felt was that they wanted to do a fair day's work for a fair day's pay. He added that some contractors undertook to do work at a price which in the end proved insufficient for even the cost of material, and he wished all builders to bear in mind that, especially where public bodies were concerned, they were expected to do good work whether their contract terms were low or not. Mr. A. Crowther said there was a great change in conditions now a days compared with, say, 27 years ago, when he entered upon a business career. At that time it was not so much a question, as it is now, on the part of persons intending building of "how much?" but of "how soon could the work be done?" He argued that the cause of this manifest distrust of contractors was the increased price of labour, it being now something like 10s. per week more per man, on an average, than at one time. Mr. Studdard deplored the feeling which, at the present time, existed between architects and contractors. If there was more of honesty and morality among them than was to be seen sometimes, there would be less jealousy of each other. Mr. Varley, of Slaitwaite, suggested that architects should send out to contractors in whom they had confidence that they would do the work well. The Chairman remarked that he could not see any

reason why the clause in the shape of the title of the lecture should not be inserted in advertisements. Often in reply to advertisements were received tenders from men not really able to do the work concerned, and he saw no injustice whatever to honest tradesmen by the insertion of the clause. The great secret of successful contracting was having good workmen who could be relied upon to do the work satisfactorily and thoroughly. The proceedings concluded with a cordial vote of thanks to the lecturer and chairman, on the proposition of Mr. J. Dawson, seconded by Mr. Barraclough, of Holmfirth.

#### OBITUARY.

By the death at the comparatively early age of nine-and-forty of Mr. HARRY BATES, A.R.A., English art has unexpectedly lost one of the foremost sculptors in the prime of his powers. Born at Stevenage in 1850, Harry Bates passed through a long apprenticeship in architectural decoration before beginning regular studies in plastic art. In 1879 he entered the Lambeth School of Art, though without relinquishing the actual practice of his craft, and there studied for a time under Jules Dalon, then the teacher of modelling. Bates won a silver medal in the national competition at Kensington, and upon Dalon's departure he was received into the schools of the Royal Academy. There he won in 1883 the gold medal and the travelling studentship of £200 with his relief of "Socrates Teaching." He went to Paris, where he studied under Rodin. He executed in that atelier a head of Mr. Bussell, an American painter, and three small bronze panels representing scenes from the "Odyssey." These, when exhibited at the Royal Academy, attracted much attention;—their purchase by the trustees of the Chantrey bequest was actually voted, but had to be cancelled because they were not modelled in England. In 1885 Mr. Bates's "Eneas" was exhibited at the Academy, and in the following year his "Homer." In 1887 he showed three panels from the story of Psyche, and the "Rhodope," and in 1892 the group called "Hounds in Leash." This group obtained for Mr. Bates his election as A.R.A. At the same time he showed the figure called "Pandora," which was purchased out of the Chantrey Fund, and is now in the Tate Gallery. Among subsequent commissions was an equestrian statue of Lord Roberts, which was found too large for admission into the Royal Academy, and was set up in the courtyard of Burlington House. This statue was cast in bronze and removed to Calcutta. Mr. Bates was instructed to make a companion equestrian statue of Lord Lansdowne to celebrate his Viceroyalty; this, of which the full-size model is finished, will be placed opposite to that of Lord Roberts. Other important works of Mr. Bates's are a colossal statue of the Queen for Dundee, and another, of heroic size, of one of the Indian Maharajahs.

#### CHIPS.

Mr. Thomas Drew, of Dublin, President of the Royal Institute of Architects of Ireland, desires to announce that central rooms have been established for that institute at 20, Lincoln-place, Dublin.

Owing to the Government requiring their old premises at No. 5, Whitehall, for the site of the new War Office, Messrs. Dennett and Ingle have removed to No. 24, Queen Anne's-gate, London, S.W., where all communications should be addressed.

Mr. A. J. Hepper, D.S.O., R.E., an inspector of the Local Government Board, held an inquiry at the town-hall, Weston-super-Mare, on Tuesday, relative to an application by the urban district council for sanction to borrow £1,055 for works of water supply.

The 16th annual dinner of the Clerks of Works' Association will be held at the King's Hall, Holborn Restaurant, on Monday week, February 13. Mr. E. W. Mountford, F.R.I.B.A., will occupy the chair.

The demolition of All Saints' Almshouses, Bristol, which have been purchased by the Bristol United Breweries, Ltd., for the extension of their business premises, has been commenced concurrently with the laying of the foundations of the new almshouses to be erected in St. James's Barton by Mr. A. J. Beaven, from designs by Mr. T. Scammell, both of Bristol. Pending the completion of the new buildings the inmates are being accommodated in temporary premises in King-square.

#### COMPETITIONS.

EDINBURGH.—MIDLOTHIAN COUNTY COUNCIL BUILDINGS.—A special meeting of the Midlothian County Council was held on Friday in the County Buildings, Edinburgh (Sir James Gibson Craig, convener, in the chair) for the purpose of receiving the report of a sub-committee on the question of the reconstruction or re-erection of the county buildings. The sub-committee reported that, after having fully considered the question of the reconstruction of the county buildings, they were of opinion that the work should be proceeded with as soon as possible, and by a majority of five votes to four they recommended that there should be an open competition in the matter of the designs to be submitted for the proposed new buildings. The committee also recommended that powers should be given to them to advertise inviting architects to send in plans and also to draw up conditions for the guidance of competitors. Mr. Welsh, in moving the approval of this report, stated that they had had a standing committee on this matter for nine years. Dr. Rowand Anderson advised the former committee, and prepared a set of plans for rearranging the interior of the buildings and for putting an elevation towards George IV. Bridge. To his (Mr. Welsh's) mind, that elevation was not in keeping with the requirements of the site. They had one of the best sites for the county buildings that could be found in Edinburgh, with a frontage of about 160ft. to George IV. Bridge, and a frontage of about 80ft. to High-street. Dr. Anderson had submitted his plan, and had been paid for it. They should, however, have all the light and service they could get, and to his mind that could be best and most fairly obtained by throwing the whole matter open to public competition. Mr. Wilkie, of Ormiston, moved an amendment to the effect that they should invite a few selected architects to prepare plans. A long discussion followed, but in the end the sub-committee's report was adopted by 16 votes to 11.

PETERBOROUGH.—The city council on Friday received the report of the sub-committee upon the plans submitted for the proposed additions to the Guildhall. Acting on the report of the assessor (Mr. J. C. Traylen, of Stamford), it was decided that No. 6 was entitled to the first prize, No. 1 to the second, and No. 2 to the third. Ald. Nichols dissented, claiming that No. 8, although possibly weaker in interior design, was best from an exterior point of view. After much discussion the report was passed, and will come up for confirmation at the next meeting of the council, when the names of the successful competitors will be divulged. The architect whose plans were selected has made the new building harmonise with the present Guildhall, and there is practically no alteration in the ancient and picturesque structure except in the joining of the roofs. The front elevation in Church-street corresponds with the Guildhall. The plans show a basement. On the ground floor are the town clerk's public office (18ft. by 15ft. 3in.), with his private office (16ft. by 15ft. 3in.) adjoining. The existing staircase to the Guildhall, with slight adaptations, continues to serve as the public entrance, and thus any alteration in the seating of the council will be avoided. On the first floor are the mayor's parlour (18ft. by 15ft. 3in.) and a committee room (16ft. by 15ft. 3in.), cloak-room and lavatory accommodation, and a smaller cloak-room, &c., approachable from the public staircase. The second floor is entirely utilised for storerooms. The cost is estimated to come just within the £2,000 limit prescribed by the corporation.

At a meeting of the Middlesex County Council, the joint committee of Surrey and Middlesex recommended that the new Kew Bridge should be widened to the extent of 10ft. beyond the 45ft. originally designed, if this could be done at an additional cost approximating to £24,000. The report was adopted.

On Saturday the Bishop of Bristol dedicated a new pulpit which has been erected at the expense of an anonymous donor in St. Andrew's Church, Avonmouth, as a memorial to the Rev. David Wright, the first vicar of Stoke Bishop. The pulpit, which is of Bath stone with a carved border, and having in three of the panels the figures of St. Andrew, St. Paul, and Christ after the Resurrection, the latter occupying the central position. In the fourth panel is an inscription. The pulpit is from the design of Mr. Wood Bethell, of London, and it has been executed by Messrs. H. Hems and Sons, of Exeter.

## PROFESSIONAL AND TRADE SOCIETIES.

**GLASGOW INSTITUTE OF ARCHITECTS.**—A general meeting of this institute was held yesterday in the rooms, Pitt-street, Glasgow—the President, Mr. David Barclay, I.A., in the chair. Mr. Gavin Paterson, Cadzow-street, Hamilton, was unanimously elected a member. The president referred to the lamented death of Mr. James B. Stewart, architect, Greenock, who had held a high position in his profession, and was long a member of the institute. The secretary, Mr. C. J. McLean, reported a correspondence he had had with the corporation regarding the Glasgow Buildings Regulations Amendment Bill, and stated that a conference had been arranged between the corporation's committee and the representatives of the institute, but that before the conference was held an intimation had been received that the corporation did not intend to proceed with the Bill in the ensuing session of Parliament. A letter was read from Mr. George A. Paterson, the present holder of the Alexander Thomson Memorial Studentship, giving descriptive notes of his tour, and submitting for the inspection of the institute the drawings and sketches made by him during his stay abroad. The meeting directed that the second instalment of the studentship of £60 should be paid to Mr. Paterson. It was resolved that the subject of the next competition for the Alexander Thomson Memorial Travelling Studentship should be "A Gentleman's Country House." It was recommended that the library committee should suggest works on architectural subjects suitable for purchase to the value of £20.

## NATIONAL ASSOCIATION OF MASTER BUILDERS.

—The 21st annual conference of the National Association of Master Builders was held at the assembly-rooms at the town-hall at Bradford yesterday. The retiring president, Mr. J. S. Jones, of Liverpool, moved the adoption of the report, which stated that the scarcity of labour in several branches of the trade was causing great inconvenience, and the attention of members was drawn to the advisability of strenuously resisting the demand made by the operatives, which appeared to be a general one, to limit all apprentices by a legal form of indenture. The retiring president, in moving the adoption of the report, said the aggressive attitude adopted by some of the trade unions, particularly in reference to freedom of management on the part of employers, had become no longer bearable. No doubt the council would be called upon to enjoin the federations to adopt some policy which would effectually check these aggressive measures. The motion was seconded by Mr. Green, of Liverpool, and was carried. Alderman W. Holdsworth, of Bradford, was then unanimously elected president for the ensuing year. After the election of the council, it was resolved, on the motion of Mr. Church, of Bristol, seconded by Mr. Shepherd, of Bermondsey, "That all cases of emergency arising between full meetings of the council shall be dealt with by the standing committee." Mr. W. Cunliffe moved, "That the executive should do all they can to secure the formation of a foremen's union, and insist upon the foremen joining it and being liberated from the operatives' union." After discussion, the resolution was carried. An official statement was afterwards made that a resolution confirmatory of the points of a circular sent out by the London builders some days ago had been carried unanimously. The resolution was as follows:—"That the second council inform the National Association of Operative Plasterers that, in consequence of the hindrance of business and continued friction caused to employers by the conduct of their members, the National Association of Master Builders have determined to call on them for an assurance that they in future abstain from the objectionable practices set out in the printed circular of January 11, and to request a reply by February 14." The next annual meeting will be held at Plymouth.

**NEWCASTLE AND GATESHEAD TRADES EXCHANGE.**—The annual dinner was held in the Exchange premises, 62, Grainger-street, Newcastle-on-Tyne, on Thursday in last week, Mr. John George Walker presiding. Mr. G. G. Laidler proposed "The Architectural Profession and the Building Trade." He said he thought there were good grounds to believe that they were entering upon a time of great prosperity. An important improvement, which he should like to see carried out, was the extension from Grainger-street to New Bridge-street, and he hoped that

the architects who might have anything to do with the elevations would carry out that street on similar lines to Market-street at the present time.

—Lieut.-Col. F. R. N. Haswell, in responding, said architects' designs were absolutely worthless unless they were given adequate expression to by those who had to carry them out. How often did they find that designs, good in themselves, were infinitely marred, to the great disgust of the masters, by incompetent workmen? He only wished they could in some way or another re-establish their old guilds.—Mr. W. H. Allen also responded, as did Mr. R. H. Millican.—Mr. J. S. Robson proposed "The Exchange," to which the Chairman and Mr. W. Sutton, secretary, responded. The latter said the membership was now some 170, and they wanted 200 before the thing would pay.

**ROYAL CAMBRIAN ACADEMY OF ART.**—The annual meeting was held at Plas Mawr, Conway, on Saturday, Mr. Clarence Whaithe, R.W.S. (president), in the chair, and Mr. Grundy (vice-president) in the vice-chair. The officers were all re-elected, with votes of thanks for their services. The following were elected the council for the ensuing year:—Messrs. Ayling, Cockram, Pain Davies, B. Fowler, B. Fisher, Anderson Hague, G. Harrison, Clinton Jones, J. Knight, P. Knight, F. Longshawe, A. F. Perrin, C. Potter, J. C. Salmon, and G. Sibley. The following were elected Associates:—Mr. Lester Sutcliffe, Leeds; Mr. J. W. Booth, Middleton, Manchester; and Mr. Alyn Williams, London. It was resolved to have an open exhibition again this year, to be opened on May 27.

**SCOTTISH BUILDING TRADES' FEDERATION.**—A quarterly meeting of the executive was held on Jan. 27 in the Station Hotel, Stirling. Mr. James Leslie, builder, Aberdeen, president, occupied the chair. Members were present from Inverness, Aberdeen, Arbroath, Dundee, Perth, Edinburgh, Glasgow, Hamilton, Coatbridge, and Ayr. The secretary, Mr. James L. Selkirk, C.A., Glasgow, submitted a report dealing with the formation of new branches, as to which encouraging progress was being made; the operation of the Workmen's Compensation Act, 1897, the rate of premium to insure against which was generally regarded as much too high, a committee being appointed to consider the whole question; the proposed "General Conditions of Contract," which were still under the consideration of the various parties concerned; and the formation of a special fund for the purpose of meeting exceptional requirements. The half-yearly meeting of the federation was appointed to be held in Dundee in April next.

**SCOTTISH MASTER PAINTERS' ASSOCIATION.**—In connection with the annual meeting of the Scottish Master Painters' Association, the members of the body visited the Dundee Technical Institute on Saturday for the purpose of witnessing the competitive work forwarded by the apprentices in the various districts, and ascertaining the awards of the adjudicators. In the first class the prize-winners were:—Plain Painting (for a set of two panels, one finished flat and the other varnished)—1, W. Nimmo, Ayr; 2, Joseph S. Robertson, Dundee. Marbling (for a set of three marbled panels)—1, Joseph S. Robertson; 2, A. K. McLeod, Coatbridge. Graining (for a set of three panels)—1, A. K. McLeod; 2, Joseph S. Robertson. Sign Writing (for an example of lettering the following:—"The Association of Master Painters in Scotland. Annual meeting at Dundee, 1899")—1, W. Morrison, Glasgow; 2, W. Nimmo; extra prize, W. W. Findlay, Dundee. Stencils—1, A. Gardner, Glasgow; 2, G. Martin, Glasgow. Design (for a coloured design for the decoration of a dining-room, including door)—1, A. J. Orr, Glasgow; 2, J. Ramsay, Ayr. In class two the winners were:—Plain Painting—1, P. Parker, Ayr; 2, G. Grant, Dundee. Marbling—1, J. S. Law, Dundee; 2, W. McLaren, jun., Forfar; extra prize, J. Ross, Glasgow. Graining—1, M. Quin, Dundee; 2, A. McKay, Glasgow. Sign Writing—1, R. Douglas, Glasgow; 2, C. Arkison, Dundee; extra prize, W. Cumming, Aberdeen. Colour Decoration—1, J. Shaw; 2, A. G. Lindsay, Galashiels. President's Gold Medal for General Excellence—Joseph S. Robertson, Dundee. Mr. Sutherland's Prize for Graining—A. K. McLeod, Coatbridge.

**THE ARCHITECTURE OF GALLOWAY.**—A meeting of the Architectural Section of the Philosophical Society of Glasgow was held on Monday night in the rooms, 207, Bath-street, Glasgow.

Mr. P. Macgregor Chalmers presided. Mr. Edwin Forbes, Edinburgh, read a paper on "Architecture in Galloway," which he said was a record of his own work as a student of the Edinburgh School of Applied Art. In the course of the lecture he dealt with Sweetheart, Dundrennan, and Glenluce Abbeys, and Caerlaverock Castle, in addition to a number of minor domestic keeps and castles. One could not, he said, get finer and simpler specimens of Gothic architecture anywhere than in the South of Scotland, where a great revival took place in the beginning or early in the 12th century.

**WAKEFIELD AND DISTRICT MASTER BUILDERS' ASSOCIATION.**—The first annual meeting was held at the Brunswick Hotel, Borough Market, on Thursday evening in last week, Mr. John Bagnall in the chair. The election of officers resulted in the unanimous re-election of Mr. Bagnall as president, Councillor Judge and Mr. F. W. Denhole as vice-presidents, and a committee consisting of Messrs. R. L. Leake, C. S. Denison, Tom Lee, Henry Fallas, J. Hesling, Geo. Crooke, Geo. Blakey, F. E. Mosley, Charles Driver, M. R. Rycroft, and John Goodall.

## Engineering Notes.

**KNOTT END RAILWAY.**—Sir M. W. Ridley, Bart., M.P., Home Secretary, cut, on Friday, the first sod of the Knot End Railway. A line has long existed between Garstang and Pilling, a distance of five miles, and this will now be extended to Knott End, another six miles. By the construction of the line the distance from Lancaster and the north to Fleetwood will be shortened by eighteen miles. Sir Douglas Fox is the consulting engineer, Messrs. Garlish and Sykes are the local engineers, and Mr. R. Worthington, of Dublin, is the contractor for the railway.

## CHIPS.

Steps are being taken with the object of adding a tower to the otherwise now-completed church of St. Paul, Truro.

Shortly after Bismarck's death the students' unions in the twenty-seven universities of Germany held meetings, and agreed that columns, as memorials of the great Chancellor, should be erected over the face of the country. The students have collected a considerable fund for the purpose, and a committee has been formed to carry out the details. In addition to the twenty-seven universities, each of which is pledged to erect its own column, forty-seven towns have already declared their intention to join the movement. The columns are to be of granite, with an urn or brazier on top, from which fire will flame on every 1st of April till the end of time. The students have offered a wreath of iron laurel leaves as a prize for the best design for a column.

The negotiations on the part of the London County Council to acquire the site of Lady Holles's School, in Redcross-street, for the purpose of a new fire-station, have practically been concluded, and in the course of a short while a report on the subject will be presented to the council by the Fire Brigades Committee. The price to be paid to the trustees of the charity will range between £30,000 and £34,000.

The vast number of typewriters in use in the business world is sufficient testimony to the advantages of the modern writing-machine. By the leisured classes, however, this instrument, so far-reaching in its virtues, has been received with scant favour, though signs are not wanting that this prejudice is being gradually demolished. Some years ago the Emperor of Germany purchased a Yost machine, with which from time to time he has expressed considerable satisfaction. As the outcome of his close personal acquaintance with this instrument, his Imperial Majesty has recently consented to receive official reports written on the typewriter, a noteworthy departure from the traditions of Court etiquette, and an example worthy of emulation in other quarters. This may be looked upon as a great victory for the Yost machine.

The annual dinner of the Shrewsbury and District Master Builders' Association was held at the Lion Hotel, Shrewsbury, on Wednesday week. The president, Mr. W. T. Williams, was in the chair, and the vice-president, Mr. H. Price, in the vice-chair.

New schools are now being erected at Normanton, from the designs of Mr. A. Hartley, architect, Castleford, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

## Building Intelligence.

**FELIXSTOWE.**—On Thursday in last week the corner-stone of the chancel that is being added to the modern church of St. John the Baptist on the cliff at Felixstowe was laid with Freemasons' rites. The new work will consist of a chancel 40ft. by 25ft.; a morning chapel for daily services on the north side, 30ft. by 20ft.; clergy and choir vestries on the south side, divided by a wooden partition which can be removed so as to form one large room, 35ft. by 30ft., for meetings, &c., and an organ-chamber over the choir vestry. The chancel will be divided from the nave by a low brick and stone screen, 4ft. high, and the vestries and morning chapel will also be divided by screens. 250 additional seats will be provided, and the cost will be £2,715. The architects are Sir Arthur Blomfield and Sons, and the contract is in the hands of Mr. Fred C. Thurman, of the Walton Building Works.

**HANDFORTH, CHESTER.**—The new parish church of St. Chad has now been completed, and the Bishop of Chester has arranged to conduct the opening ceremony early in March. The church has been erected on land near the old structure. The building is Perpendicular in style, with half-timber gables and other details characteristic of the buildings of Cheshire. The walls are of brick, with Alderley stone dressings to the windows, doorways, and buttresses, and the roof is covered with Broseley tiles. Mr. John Brooke, F.R.I.B.A., of Exchange-street, Manchester, is the architect, and Mr. Thomas Browne, of Chester, is the contractor. It is proposed to add a tower, transepts, and vestries later on, and when the entire scheme has been carried out there will be about 300 sittings. The scheme will involve an outlay of about £3,000. The old church is now to be taken down, and the land is to be added to the burial-grounds.

**LONDON COUNTY COUNCIL.**—At Tuesday's meeting of this authority it was agreed, on the recommendation of the general purposes committee, that applications for the appointment of superintending architect should be again invited by public advertisement, and that the salary to be attached to the appointment should be increased from £1,500 to £2,000 a year. The asylums committee recommended the Council to approve an estimate of £3,000 for the preliminary expenditure in connection with the provision of a working colony for male epileptics. It is proposed to establish the colony on a portion of the Council's estate at Horton Manor, Epsom, where a large general asylum is now in course of erection. It is to embrace eight detached structures. Provision is to be made for 300 patients, to be specially selected by transfer from the London asylums. The committee reported in favour of the temporary style of building, which they estimated to cost £43,189, or £144 per bed. They also mentioned that if a permanent building was provided it would cost £66,012, or £220 per bed. After a brief discussion the Council agreed to provide the colony, but desired that plans for a permanent instead of a temporary structure should be submitted.

**TRURO CATHEDRAL.**—Lord Mount Edgcumbe presided on Friday at a meeting of the Cathedral Building Committee, held at Phillpotts' Library, Truro. The report of the executive committee showed that Mr. Frank L. Pearson's estimate of the expense of the alternative plans of building the nave as a memorial to the late Archbishop Benson was (a) with the towers up to the level of the aisle roof, £36,000; (b) with towers up to the level of the nave roof, £41,000. Towards this sum about £30,000 may be reckoned upon as available. The committee were of opinion that they would be justified in proceeding with the work provided the contractor's tender does not materially exceed that of Mr. Pearson's estimate. The amounts mentioned included not only the architect's estimates for the building, but also architect's commission, clerk of works' salary, and heating and lighting. The adoption of the executive committee's proposal was unanimously carried. Some discussion arose over the method of tendering. The architect suggested that the following six firms should be invited to tender:—Messrs. Shillito, Bury St. Edmunds and London; Messrs. Thompson, Peterborough; Messrs. Cornish and Gaymer, North Walsham and London; Messrs. Cowlin, Bristol; Messrs. Willcocks, Wolverhampton; and Messrs. Luscombe, Exeter. The committee, however, were divided, and an amend-

ment was proposed to the effect that tenders should be thrown open generally. This was lost; but a subsequent proposition that the executive committee, in consultation with the architect, be empowered to add other names, not exceeding six in number, was carried. It was also decided that the architect be asked to attend the meeting of the committee at which they were opened. It was decided to give six weeks' notice to quit to the tenants of the house adjoining the rectory, which will be required at once for demolition to make space for the workshops.

### LEGAL INTELLIGENCE.

**THE LAYING OF ELECTRIC MAINS.**—**BATTERSEA VESTRY V. COUNTY OF LONDON AND BRUSH ELECTRIC LIGHTING CO.**—In the Court of Appeal, on Monday, before the Master of the Rolls and Lords Justices Rigby and Vaughan Williams, an appeal was heard of the London and Brush Electric Lighting Company against a judgment of Sir F. Jeune, sitting in the Chancery Division, granting a mandatory injunction against the appellants on the application of the vestry of St. Mary, Battersea. The appellants, having been unable to come to terms with the vestry in reference to the laying of a cable in Trinity-road, Battersea, broke up the footpath and laid the cable without their sanction. This was admittedly illegal; but the question as to the granting of a mandatory injunction depended on whether the vestry had any property in the subsoil of the street. Sir F. Jeune had held that the vestry were entitled to a mandatory injunction; but their Lordships, while stigmatising the conduct of the appellant company as high-handed and lawless, found that the plaintiffs had not established that any right of theirs would be interfered with by the continuance of the appellants' pipes and wires where they were, and therefore allowed the appeal and dissolved the mandatory injunction, but without costs.

**COMPENSATION UNDER M. A. TAYLOR'S ACT.**—**HOPE V. THE FULHAM VESTRY.**—This case for compensation was tried before Mr. Loveland Loveland, deputy chairman of the Middlesex Sessions, at the Sessions House, Clerkenwell, on Saturday. The case was one under the Michael Angelo Taylor's Act, whereby they are enabled to acquire a portion only of a person's premises without taking the whole, and in this case it was for taking a slip of land 5ft. in width from the entire frontage of the claimant's premises in Bayley-lane, adjoining the Queen Elizabeth Tavern, which is a newly-erected public-house, and is owned by Mr. Adams, himself a vestryman of the Fulham Vestry. After the jury had viewed the premises, the hearing of the case was resumed, when Mr. J. M. Klenck, of the firm of Messrs. J. M. Klenck and Co., Bishopsgate-street, City, auctioneers and surveyors, gave evidence for the claimant, and made the valuation for the present injury to the premises £217. This was confirmed by Mr. J. H. Wheeler, of the firm of Messrs. Wheeler and Sons, of Fulham-road. After this evidence, the vestry gave an undertaking to exonerate Mrs. Hope from the cost of paving Bayley-lane in front of her premises, and agreed to reinstate the dwarf wall and fencing and the front wall of the stables, estimated at £80. The vestry called to support their contention Mr. Charles Botterill, their surveyor, Mr. Boyden, of Fulham, and Mr. T. W. Biggs, of Clifford's Inn, who said there was no inquiry to the property, but that it would be a positive benefit to the same; but in cross-examination one of the witnesses admitted it could not exceed £30. After a very careful summing-up of Mr. Loveland-Loveland, the jury retired and came into court and gave a verdict of £120, in addition to the vestry's undertaking in reference to the paving and reinstatement of the walls and fencing, which would make the verdict equal to £200. The sealed offer of the vestry was for £20 only.

**THE WIDENING OF FLEET-STREET.**—At the quarter sessions held at the City Guildhall on Tuesday, the case of the "Governors of St. Bartholomew's Hospital v. City of London Corporation" was mentioned before the recorder (Sir Charles Hall, M.P.) and a special jury. This was a claim for about £20,000 compensation in respect of the acquisition of an area of freehold land, containing 1,078ft. super., at present forming the site of Nos. 1 and 2, St. Bride's passage, required for street-widening purposes. It was announced that a settlement had been arrived at, the parties agreeing to accept a verdict for £16,000, the costs to be taxed.

**LIGHT AND AIR CASE AT EXETER.**—In the Chancery Division, last week, Mr. Justice Byrne heard, on several days, the case of the trustees of the Providence Chapel, Exeter v. Devon and Exeter Turkish Bath Company (Limited). In giving judgment, his Lordship said opposite the chapel there formerly stood almshouses, which were pulled down. Defendants having acquired the

greater portion of this site near the chapel, proceeded to erect thereon baths, and over them bedrooms, intended as an adjunct to the hotel. Looking at the evidence, he could not resist the evidence that there had been a material diminution of the light. One argument had been founded on the suggestion that a portion of the site of the old almshouses, not yet built upon, afforded a certain amount of diffused light, which was sufficient compensation for any light of which they might have been deprived, and that, therefore, he was not to say there was obstruction. But he came to the conclusion that, as the building stood, the light coming to these classrooms had been materially interfered with. It was clear there should be an order to pull down some portion of the defendants' building. He could not do better than adopt the angle of 45° obstruction rule, and in doing so, and having regard to the narrowness of the thoroughfare, and to the other circumstances in the case, he was disposed to think he was giving defendants the benefit of the rule rather than imposing something stronger than he might impose. Accordingly, his lordship held that the plaintiffs were entitled to a mandatory injunction directing the defendants to pull down in accordance with a line which should allow obstruction to the angle of 45°. Defendants having failed in the action, they must pay the costs of it. His Lordship said the operation of the injunction would be suspended for six weeks, so as to allow the parties to come to some agreement.

**BUILDING NOTICES FOR SUBWAYS.**—At Southwark, on Tuesday, William Coat, surveyor of roads to the Newington Vestry, was summoned by Mr. Bernard Dicksee, district surveyor, for failing to give a building notice in respect to two structures under the footway in Newington-causeway. The vestry have obtained a provisional order to supply electric light in the neighbourhood. Trenches have been dug along the main thoroughfares, including Newington-causeway, for the electric light cables and the wires of the National Telephone Company. An inspection chamber has been constructed under the footway every 150yds., and Mr. Dicksee contended that under section 105 of the Building Act, he was entitled to the usual notice. The vestry, on the other hand, submitted that if this contention was right the district surveyor would be entitled to a fee in respect of every sewer inspection chamber. Mr. Dicksee pointed out that the chambers in question were much larger than sewer inspection chambers, and, further, that part of the roof was under the footway. Mr. Paul Taylor said he considered these chambers were covered by the words "building, structure, or work," contained in section 145, and he therefore gave a decision in favour of the district surveyor. Defendant would have to pay a nominal penalty of 1s. and 2s. costs on each of the two summonses. The magistrate declined to state a case, on the ground that it was purely a question of fact.

**THE EALING AND SOUTH HARROW RAILWAY.**—On Saturday, at the Surveyors' Institution, Savoy-street, Mr. F. T. Galsworthy heard the claim of Colonel Douglas Williams against the Ealing and South Harrow Railway Company for land proposed to be acquired for the construction of that railway. The land proposed to be acquired was part of the Twyford Abbey Estate. When the abbey and a part of the land had been purchased by Mr. Allhausen access to the avenue was reserved for all the tenants of land on each side which might be laid out as building land. This land had a frontage of 626 yards to the avenue, and of the same extent to Hanger-hill-lane. The compensation was for the value of the land taken, damage to the estate by severance, and disturbance. On the part of the claimant, Mr. E. H. Towson, Sir John Whittaker Ellis, and Mr. W. R. Peck (Hampton and Son) estimated the four acres of land taken at £2,056, with 10 per cent. for compulsory sale; the damage to the estate at £12,617, from which they deducted £1,000 for the bridge agreed to be constructed by the railway company; and the frontage to the avenue taken £720. On the part of the railway company, Mr. A. R. Stenning, Mr. Wreathall, and Mr. Howard Martin estimated the damage at £1,709, £1,747, and £2,158 respectively. They estimated the land at £200 and £250 an acre, and the only damage to the estate would be amply compensated by £800 or £1,000. The arbitrator reserved his award.

An inquiry was held at Plymouth on Friday respecting an application by the Light Railway Development Company for an order empowering them to construct a railway from Saltash to Callington, both in Cornwall. Mr. C. S. Meik, the engineer of the line, said that the probable cost of the railway would be about £100,000, and the length 11½ miles. Besides several embankments, two viaducts would have to be constructed. The estimated cost was £9,000 a mile, and the ruling gradient was 1 in 40. The Commissioners intimated that they would issue the order, and recommend it for confirmation to the Board of Trade.

## Our Illustrations.

MAIN ENTRANCE, CRIPPLEGATE INSTITUTE, GOLDEN LANE, E.C.

The central doorway of this building leads, on the ground floor, to the lending library and reading-rooms, and to the grand stairs (leading to the hall on first floor). It is carried out in Portland stone, and the figure bearing electric light in bronze, all from special models. The spandrels illustrate Science and Art, and the central keystone bears the arms of the ward. The general facing of the building is Fareham brick, with Portland stone dressings, the total cost being about £30,000. Messrs. Bywaters were the builders, and the building has been opened now some time, and is a great success. It contains reading-rooms, lending library, boys' room, concert-hall, ward offices, committee-room, refreshment rooms, technical instruction and classrooms, and residence for caretaker. Mr. Sidney R. J. Smith, with whom Mr. F. Hammond, F.R.I.B.A. (the surveyor to the governors) was associated, carried out the whole of the work, including all fittings, and it is still further under consideration as to some decorative additions to the building.

MAIN ENTRANCE, WEST HAM INSTITUTE.

When Mr. J. Passmore Edwards opened these buildings on October 6th last, we published a drawing of the entrance to the library. To-day we publish a detail photograph taken by Mr. Bedford Le Mere of the main entrance to the institute. One of the distinguishing features of these buildings is the capable use of architectural sculpture, excellently rendered by Mr. Birnie Rhind, A.R.S.A. The view now given shows how the symbolical figures are arranged on either hand of the portal, with the coffered hood above. Cranleigh red bricks and Portland stone are used for the façades. Plans and elevations of these buildings, which were designed by Messrs. Gibson and Russell, will be found in the BUILDING NEWS for October 4th and 11th, 1895, when the competition was settled. We gave a general view at the same time.

CANADA HOUSE, BRISTOL.

CANADA HOUSE, of which we give an illustration is being erected at the corner of Baldwin-street, Bristol, by Messrs. Ford and Canning. The upper floors will be used as offices and strong-rooms. In the basement is a bonded cellar. The front, in a Flemish rendering of the Renaissance, is executed in Cattybrook facing bricks, with orange rubber brick and freestone dressings; the roofs to be covered with slate. The architects are Messrs. W. B. Gingell and F. Bligh-Bond, of the same city. No contractor is employed, as the proprietors' own men, under the superintend-

ence of a building manager, are executing the work. Messrs. Elder, Dempster, and Co., will occupy the ground floor as their central offices. The cost of the block will be about £10,000.

THE STOREY HOME, ROYAL ALBERT ASYLUM, LANCASTER.

THE Storey Home for feeble-minded girls, Royal Albert Asylum, built and equipped by the late Sir Thomas Storey, of Lancaster, from designs originally prepared by the late E. Howard Dawson, A.R.I.B.A., has been carried out by that architect's successor, Mr. Chas. J. Ashworth, Market-street, Lancaster. The buildings, which occupy a commanding site opposite the Royal Albert Asylum, are externally grouped together in a somewhat effective way. The walls are built of local stone and faced with broken coursed shoddies, the windows being relieved with plain dressings and hood-moulds. The roofs are covered with Westmoreland green slates and red terracotta ridges and finials, so as to be in keeping with the asylum buildings. The gables are of half-timber work, with panels of tinted cement stucco, and are finished with moulded bargeboards. The principal entrance, which is placed on the right side of the main front, is balanced by a corresponding bay window on the left. Internally, the arrangements have been carefully thought out. The walls and ceilings of the vestibule and hall have been panelled and moulded in plaster, the floors paved with ceramic marble mosaic, and the windows glazed with stained glass and ornamental lead quarries. On one side of the hall is a small day-room, 22ft. by 18ft.; on the opposite side is the matron's sitting-room with windows commanding a view of the drive. From the hall there is a flight of stairs to the first floor, and a passage to the kitchen, 18ft. by 18ft., with window to the north. The scullery adjoins the kitchen, and pantries, larder, and stores are provided. The service-room is placed on the other side, conveniently near to the day and dining-room. This is 35ft. by 21ft. by 12ft. high, and occupies the southern wing of the block. A lavatory, 20ft. by 16ft., furnished with cloak and shoe cupboards, is placed to the rear of the day-room, and a side entrance for the use of the girls is arranged, and another door gives access to their latrines in the yard, which is inclosed. The laundry and washhouses have been fitted up in a complete manner with Bradford's appliances. On the first floor accommodation is provided for 29 beds in two dormitories—one 35ft. 6in. by 20ft., the other 41ft. by 18ft. 6in. These are lofty rooms, each with two fireplace. Next to the dormitories are the matron's and servants' bedrooms, having glazed inspection windows. There is a bathroom for five baths, and small staff bathroom adjacent thereto; also a lavatory, the floor of which is in polished teak, and the dado is tiled. There is also a linen-room and store-cupboards. The w.c.'s and housemaid's sink are separated from the main building by a ventilated lobby. On the second floor, over the centre portion of the building, there is another dormitory, 36ft. by 16ft., for eleven beds, and two additional rooms for servants. An isolation room for two beds, and a night nurse's bedroom, also w.c.'s and sink over that on lower floor. A special emergency staircase is provided, of fire-resisting material. The walls of the passages, staircase, latrines, &c., are lined to a height of 4ft. with salt-glazed bricks. The floors of day-room, dormitories, &c., are of pitch-pine, stained and polished. The heating and ventilating is to be effected by open fires, supplemented by hot water, on the low-pressure system. The sanitary arrangements include self-flushing combination closets in all w.c.'s. The Home is surrounded by its own grounds. The following Lancaster contractors have carried out the work:—The late Mr. Wm. Warbrick, and Messrs. Hatch and Sons, builder's work; Mr. Wm. Huntington, carpenters' and joiners' work; Messrs. Thos. Cross and Sons, slating and plastering; Messrs. Wm. Abbott and Co., plumbing and glazing; Ed. Payne, painting and decorating; A. Kershaw and Co., ventilating.

"HIGH FIELD," BELPER, DERBYSHIRE.

THIS residence, with stables adjoining has been built for Mr. Maurice Hunter, Belper. It is constructed with red pressed bricks and Matlock stone, with half-timbered gables in oak, and red Staffordshire tile roof. The house is pleasantly situated, and commands extensive views to the west and south, and was built by Mr. Hingley, builder, Duffield, from designs and under the

superintendence of the owner, the senior partner of the firm of Messrs. Hunter and Woodhouse, architects, Belper, at a cost of £2,400, including heating apparatus.

NEW COUNTY HOSPITAL, BEDFORD.

PREVIOUS illustrations of this series of hospital buildings will be found in the BUILDING NEWS for Aug. 23, 1897, when a view and general plan appeared, and on Dec. 30 last, on which occasion a double-page detail was given of the elevations of the principal wards. To-day we print, from the architect's working drawings, a similar sheet of details showing the verandahs treated as a sort of alcove over the main corridor, and leading off the ward staircase. It faces the Kempston-road. The builders are Messrs. Ketteridge and Shaw, of Cambridge, and the architect is Mr. H. Percy Adams, F.R.I.B.A. The cost is about £32,000.

## CHIPS.

The partnership hitherto subsisting between J. W. Howard and F. Bradshaw, of Norwich, architects and surveyors, under the firm of Howard and Bradshaw, has been dissolved.

At the monthly meeting of the Mytholmroyd Urban District Council it was resolved to apply to the Local Government Board for powers to borrow £12,423 for carrying-out the proposed sewerage scheme. This does not include the cost of the outfall works.

The new bridge (erected on the site of an older structure) which spans the Don at the bottom of Marchgate, and connects Doncaster with the country, was opened last week in the presence of the members of the West Riding County Council. The new bridge is 12ft. wider than the old one, and the watercourse has been increased by one-third.

Colonel W. R. Slack, R.E., attended a meeting of the urban district council of East Dereham last week to inquire into and arbitrate on the dispute between the local authority and the Norfolk County Council with respect to the use of Bardon Hill (Leicester) granite being used by the urban authority instead of Belgian granite recommended by the county surveyor, Mr. T. H. B. Heslop. Bardon Hill granite cost 12s. 6d., whereas Belgian granite can be bought for 11s. 1d. per ton. The amount in dispute was £58.

The public hall which Lord Pirbright is erecting at Pirbright will stand in the centre of the village adjoining the Jubilee fountain which he gave. The hall will be of red bricks, and will measure 60ft. by 30ft., and 22ft. in height. It will be panelled and floored in oak. There will be a sliding partition in the centre, making two square rooms when the entire hall is not required. There will also be two smaller rooms measuring 15ft. by 10ft. each. The work of building and decorating has been intrusted to Mr. Ball, builder to Lord Pirbright's estate whilst Mr. Briant, of Pirbright, will supply all the furniture.

Colonel Slack, C.E., a newly-appointed Local Government Board inspector, conducted an arbitration inquiry at Lynn Town Hall, on Wednesday week, into the matter in dispute between the corporation of King's Lynn and the Norfolk County Council as to the cost of the maintenance of main roads. Mr. T. H. B. Heslop (county surveyor of Norfolk), Mr. H. J. Weaver (borough surveyor of Lynn), and Mr. E. J. Silcock (ex-borough surveyor) represented the respective parties. The corporation claim was £1,411 2s. for the year ending March 1898, and from this the county council deducted £94 16s. 1d.

In the York Consistory Court faculties have been decreed to respective incumbents and churchwardens of Wath-upon-Deane to extend the reredos; to the rector and churchwardens of Bridlington to sink the "Robinson Tomb" in the Priory Church level with the ground; of St. Olave's, York, to build a new vestry on the south side of the chancel, to break doorway through the east door of the south aisle, to remove the stained glass from and build up the south window of the chancel, and to form a new window on the south side of the chancel above the level of the new vestry roof, and replace the stained glass therein; and of All Saints, Pavement, York to build a new organ chamber on the south side of the chancel.

The chancel of Addington Church, which has been restored and decorated as a memorial to the late Archbishop Benson, was reopened on Friday. The principal feature of the decorative work is low reredos of perforated white alabaster scroll work, with statues under canopies, between the north and south windows, of Archbishops Theodor, Cranmer, Laud, and Benson. On the north side are the armorial bearings of Trinity College, Cambridge, Wellington College, Lincoln, and Truro, all closely associated with the late Primate's work. Mr. A. J. Reeve was the architect for the restoration.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 80c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation Advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—H. C. L.—W. G. H. (Stafford)—F. B. A. Co. K. S. A. and Son.—S. M.—G. J. P.—N. C. and Co.—W. W. (Bristol).—R. K. A. of M.

## "BUILDING NEWS" DESIGNING CLUB.

## FIFTH LIST OF SUBJECTS.

E.—A School of Arts and Crafts, to be situated in a country town high-street on a right-angled corner site, with a lane on the return frontage. The façade will face south, and there will be a fourcourt 18ft. deep, with villa residences on the adjoining land east of the new school, the next house blank wall abutting on to the site, so that no windows can be obtained on that side boundary. The width of the school building to extend the whole limit of the frontage, which is 60ft. The depth is 200ft.; but, ultimately, a picture gallery is contemplated at the rear, and the entrance must be so contrived to the front buildings as to be available as a corridor-way, 8ft. wide in the clear, to this gallery, which will be 70ft. long by 45ft. wide. A block plan to small scale to show how the completed scheme will be contrived. The land is practically level. The accommodation for the school to provide two large studios 18ft. high, the lower to have a mezzanine gallery along one side, 9ft. wide. Each of the big studios to be 36ft. long by 25ft. wide from back to front, and each having big windows towards the north. There must be two smaller studios with north lights, and one may be contrived as a mezzanine room suitable for a small life class. There is to be a master's room or office on the ground floor. In the basement a modeller's room and a smith's shop with two forges will be needed, 10ft. high, with a wide area back and front for light. The lane frontage may have lights above the pavement level, as the ground floor will be 3ft. above the ground line. Cloak-rooms and lavatory with two basins, and two w.c.'s, one for each sex, will be needed. A model's room to be contrived in the upper studio, with w.c. and lavatory basin. A lavatory and w.c. to be provided for the master. A heating-chamber and coal-place below stairs. A kitchen living-room, with scullery, larder, &c., also in the basement, for the caretaker, whose two bedrooms will be in the upper part of the building. An open-timbered roof to be put over the top-floor studios. The staircase to be in concrete, 4ft. wide. Style, a treatment based on the Renaissance, picturesquely handled in red brick, with Portland stone dressings; roof covered with tiles. Scale, 8ft. to the inch for elevations and section. Plans may be smaller. View sketch wanted.

DRAWINGS RECEIVED.—"La Poupée," "Sparrow," "Jonnie," "Blue Funk," "Vignoria," "Hoopoe," "Nothe," "Gargoyle," "Indian Ink," "P."

## WALSOKEN CHURCH.

To the Editor of the BUILDING NEWS.

SIR,—Referring to the drawing of the above church appearing in your issue of January 27, it would be very interesting to know whether the font has been actually moved to the position shown in the north aisle, or whether the talented artist has been playing a sort of pictorial game of chess with the fittings. When I visited the church some four or five years ago, the font certainly stood in the centre of the nave at the west end, and formed a marked feature in an unusually fine vista. If it has been moved, it will be a source of lasting regret to all who know this grand church. If it has not been moved, such a misleading view should not pass without protest.

That it is ill-drawn, and shown without the imposing steps on which it used to stand, may be trifles.

It may be of interest to add that this exquisite piece of work is dated 1544, "anno dac mitto quig inte" qua dige qrtto," and that possibly a special interest may attach to it now, in view of the disputed interpretation of the "Ornaments Rubric." The western panel represents "The Crucifixion," meeting the eye immediately the worshippers entered the church by the western doors. The eastern panel shows a priest in full Eucharistic vestments, apparently in the act of elevating the Host before the kneeling people. The altar and reredos are clearly shown, and one candle is plainly visible, the other being mutilated.—I am, &c.

A. NEEDHAM WILSON, A.R.I.B.A.  
Marlborough, Jan. 31.

## HULL CENTRAL LIBRARY COMPETITION.

SIR,—The present mode of forwarding designs, without motto or distinguishing mark, has some disadvantages, as I have experienced in this instance. With my plans another competitor's report has been returned. They all bear the same number, put on by the same hand. I have complained to the town clerk, but he repudiates all responsibility, and declares the alteration "was certainly not made by anyone in my office."

It is too bad that competitors should be the victims of such carelessness. May I ask, with your kind indulgence, the competitor (who has mine) to exchange reports with me?—I am, &c.,  
A. H. GOODALL.

14, Market-street, Nottingham, Jan. 30.

## CHIPS.

In connection with their recent deputation to Glasgow, the tramway committee of the town council of Aberdeen met on Monday to frame a report on the question. A unanimous opinion was expressed in favour of the overhead trolley system. It was also agreed to recommend the adoption of double-decked cars, and the new experiment will be carried out on the Woodside route.

At a general assembly of Royal Academicians and Associates held on Tuesday evening, M. Jules Breton (painter) was elected an Honorary Foreign Academician, and Messrs. Arthur S. Cope (painter), Alfred East (painter), and W. Goscombe John (sculptor) were elected Associates.

The Light Railway Commissioners sat at Penzance on Tuesday to decide between two schemes designed to connect that town with the Land's End district, and eventually approved the one promoted by the Penzance, Newlyn, and West Cornwall Light Railway Company, to cost £150,000.

Mr. H. Cummings, chief architect in the engineers' department of the South Eastern Railway, presided over a representative gathering of the chiefs of the department at the Angel Hotel, Tunbridge, on Friday evening, the dinner being held for the purpose of entertaining and making a presentation of a gold watch and address to Mr. P. C. Barnes, chief engineer's accountant, who is retiring from the company's service.

In a case, Davis v. Day, at Wandsworth County-court, on Monday, in which an architect sued a builder for slander, Judge Lushington said the case was a most sordid one. Perhaps his view of matters might be regarded as a hard one, but he did not think builders should be considered by ordinary standards. He did not think he ever sat at that court without having malpractices of builders brought before him.

## Intercommunication.

## QUESTIONS.

[12166].—**Tenants' Fixtures.**—What are tenants' fixtures in an electric lighting installation, and how much is removable by a tenant as such?—FOREGATE.

[12167].—**Monkey-Puzzle Tree.**—I have a monkey-puzzle tree about 20ft. in length, 18in. diameter at base, and about 10in. at the top. Is this of any value for any purpose? I have been told that it is useful for cabinet purposes. What would be its worth, if any?—M. E.

[12168].—**Vestry Authority.**—Can the vestry order me to produce plans of my building, and have they any authority over new buildings? What are their powers?—ENQUIRER.

[12169].—**Boundary Fences.**—There is a post-and-rail fence between my garden and the ground and a large field at the back. The owners of the field have lately raised the fence, and turned what was an open post and rail into a close-paled fence. Have they any right to do this? The lower rail fence has been in existence many years, and the only reason I can imagine for taking the step they have, is that some of the tenants have been in the habit of trespassing on the field, or their sons have occasionally played in it. I should like to know what authority, even in such a case, the owners or lessees of the field have to raise the fence?—INDIGNANT.

[12170].—**Girders.—Crop Ends.**—Kindly tell me a good book on taking out the weight of cast-iron girders and columns? Also, would one of your readers kindly tell me what are "crop ends," and in what books I am likely to find information on such things?—R. L. B.

[12171].—**Shoring Buildings.**—Are there any books treating of the way to shore and support walls and floors, and, if so, their titles, &c.?—NO SIG.

[12172].—**Wood Block Floor.**—Which can be recommended as the best method of fixing the blocks, and retaining them in their position? Is there any mode of preventing the wood block springing, warping, and twisting out of a true surface? Some of the wood floors I have seen do not present a very even surface.—S. S.

[12173].—**Kitchen Boiler.**—Will an experienced hand inform me whether it is essential to overhaul a kitchen boiler every seven years or so for cleaning or scraping? Also, whether there is any risk of explosion, if hot water can be drawn from either of the taps? Is it necessary to renew such boilers, and how often? I do not think such trouble and expense is generally contemplated by landlord or tenants.—IN DOUBT.

[12174].—**Casement Fixing.**—Which is the best way to fix iron casements to stone windows. I thought of screwing the frame to wood plugs let into the stone-work. If there are lugs on the frame, how are these fixed—with molten lead, or how?—QUERY.

[12175].—**Right of Light to Rebuilt Premises.**—In rebuilding old premises, is it necessary to retain the position of old windows and their heights to enable the right of light to be maintained? An answer will oblige.—G. E. D.

## REPLIES.

[12152].—**Architect's Charges.**—I presume "Art," alias "M. A.," has quite as much knowledge of me as I have of him, and that is nil; so his remarks about "Class" are gratuitous. I concur with him that it requires "hard and constant work and study," as well as a feeling for your subject, before one can acquire excellence in any department of our profession, and he compels me to add in reply, for the architects whose names he brings forward, that unless these men were imbued with the "genius heaven-born," they could not have erected so many buildings and finished them, even to the minutest detail, unless they were giants in their profession. No common architectural mortal could accomplish so much excellent and varied work.—ED. CALVERT.

[12157].—**Baths.**—Thanks to "Trebla" for his reply to my query. Can he recommend copper for cleanliness over porcelain? Does not the enamel soon scale off the metal?—AMATEUR BUILDER.

[12152].—**Architect's Charges.**—The usual charge in London for inspecting buildings to see if the conditions are fulfilled is from 1 to 2 per cent.; the latter percentage is upon buildings up to £5,000. For approving plans, another 1 per cent. might be charged; but, of course, the charge should depend on the kind of building. An ordinary villa would not entail so much trouble as a commercial building. The time, skill, and trouble involved ought to be the basis of the charge.—G. H.

The leases of several premises in Fleet-street fell in last week, and have been acquired by the City Corporation. The present proposal is to widen the street between Ludgate Circus and Salisbury Court, and some twenty-four buildings will be destroyed on the southern side. The Corporation is already in possession of about a dozen of the buildings required, and the first two small sections of widening have been completed.

Mr. Charles E. Savery, M.S.A., has completed his book on "Memorials," and the work is now in the publisher's hands. Mr. Savery is preparing a special drawing, by desire of H.R.H. Princess Beatrice, of the memorial to the late Prince Henry of Battenberg at Whippingham, Isle of Wight, and which will be reproduced in the book, the Princess having kindly furnished the necessary photographs and information to enable the author to make such. We regret to learn that Mr. Savery is suffering from a return of heart trouble which previously prostrated him, and he has been forbidden by his medical adviser to undertake any active work for a few weeks.

## WATER SUPPLY AND SANITARY MATTERS.

**THE LONDON WATER COMMISSION.**—At Monday's sitting of the Royal Commission on the Metropolitan Water Supply, Sir A. R. Binnie, chief engineer to the London County Council, recalled, gave evidence with regard to the future supply of water from the river Lea. He drew the conclusion that the Lea valley was, for all practical purposes, exhausted; that to construct in it further reservoirs of larger capacity would only be a wasteful expenditure of money, and that it would be better to go to some other and more bountiful source. He also contended that to enable the Thames to meet the demands that would be made on it if no supply were sought elsewhere, the storage reservoirs would need an additional capacity of 28,500,000,000 gallons. Mr. C. J. More, engineer to the Thames Conservancy, said that body still adhered to the view that in no case should the quantity of water taken from the river be allowed to reduce the discharge at Teddington Weir below 200,000,000 gallons per day unless compensation were made by a tidal reservoir. Colonel Lockwood, M.P., chairman of the East London Water Company, gave evidence to the effect that the failure of the company to supply their customers last year was in great measure owing to the removal of the cisterns, and was aggravated by deliberate waste of water by consumers. The company were unwilling to sell their undertaking, especially to the London County Council, whom they regarded as the Jack Cades of the 19th century; but if purchase was decided upon, it ought to be under the Lands Clauses Act. On Tuesday, the same witness was cross-examined by Mr. Balfour Browne, Q.C., on behalf of the London County Council. He objected to any further control being exercised over the companies; but if they were to be placed under any other body, he would prefer a Government department. Mr. Bryan, engineer to the East London Water Company, maintained that the company could obtain 20,000,000 gallons a day from their wells in the chalk. The reason why the London water companies did not propose to go to Wales for fresh supplies was one of expense. What they proposed could be done for £15,000,000, as against £57,000,000 for the Welsh scheme. At the conclusion of Mr. Bryan's evidence the Commission adjourned till Monday.

**BURRATOR RESERVOIR.**—The last act of the great Plymouth water undertaking took place on Friday, when for the first time, the enormous reservoir became full to the overflowing point, and the waves began to leap up to the five arches under the roadway at the Burrator dam. The sight was witnessed by the Mayor (Alderman J. Pethick), the chairman of the Water Committee (Alderman J. T. Bond), and the Water Engineer (Mr. E. Sandeman), who throughout has carried out the work during the past seven and a half years. The lake, which covers 117 acres, is broad at the lower end and narrows away till it takes the appearance of a river towards the Lowery. At the Burrator dam the depth is greatest, being 77ft., while at the Sheepstor dam it is only 17ft. At present the amount of water in the reservoir, which is as much as it will hold, is 651 million gallons, and Plymouth could be kept upon full supply for 130 days without replenishment, the consumption daily being about 4½ million gallons. A few minor matters remain to be finished, such as the erection of a screen chamber and gauge-house. The reservoir itself, however, might have been filled at the beginning of December. The overflow which is now taking place through the arches under the roadway is 125ft. long, the five arches having each a span of 25ft., while they are 7ft. 6in. in height. The water thus released flows to the River Meavy. The Burrator dam itself is 62½ft. thick, and at the base 77ft. The sale of plant at the Burrator Works last week realised £2,300, and this, with the proceeds of a previous sale, makes a total of £5,700 received from the disposal of plant.

**GAINSBOROUGH.**—Nearly two years ago Messrs. Timmins and Sons, of Runcorn, were carrying out the second bore-hole of the Gainsborough artesian well scheme. Through the accidental breaking of the rope used in boring, the contractors lost the boring tool, weighing 35cwt., and being 30ft. in length, at a depth of 724ft. On Saturday morning the tool was successfully brought to the surface, together with several tons of soil. A sum of £3,000 has just been laid out in a new pumping plant for the No. 1 bore-hole, and a similar sum is to be expended in connection with the second boring.

Mr. Bicknell, C.E., held an inquiry on Friday at New Mill, Holmfirth, respecting the New Mill Council's proposal to borrow £9,000 for the purposes of sewage works. The council propose to join Holmfirth at the sewage outfall works, where Dibdin's system of purification will be adopted. Manufacturers present formally protested against the scheme, on the ground that it does not deal with trade effluents.

## Our Office Table.

At Tuesday's sitting of the London County Council an address calling attention to the practice of advertising in main thoroughfares by illuminated signs, and signed by about 300 architects practising in London, was submitted by Dr. G. B. Longstaff, on behalf of the National Society for Checking the Abuses of Advertising. The memorialists urged that this rapidly extending form of illuminated advertisement was leading to the progressive degradation of the Metropolis, and submitted that reasonable regard for individual liberty required that those who wished to use public thoroughfares should not be subjected to annoyance at the discretion of the owners of adjacent buildings. It should be for the duly-constituted local authorities to decide to what extent the appeal to the eye should be permitted. The fundamental issue was whether the people of the Metropolis were to be molested in the use of public thoroughfares; whether the interest of the inhabitants of a great city in maintaining the dignity and beauty of its aspect was to be sacrificed to the rivalry of tradesmen; whether architecture and scenery were to be converted at the caprice of individuals into an insignificant background for the brawls of competing makers and vendors. The memorialists contemplated no interference with such methods of advertising as were either in themselves artistic or were consistent with dignity and propriety in the aspect of our city. Even on mere grounds of safety to life and limb some of the illuminations were most objectionable. They desired to see enforced a principle of regulation which, while covering the case of illuminated signs, would necessarily apply to all advertising devices of a similar character, and suggested that the council should absolutely forbid the use of any letters exceeding a certain size or at more than a specified height above the ground level. The signatories to this appeal included Mr. G. Aitchison, R.A., P.R.I.B.A., Mr. T. G. Jackson, R.A., Mr. R. Norman Shaw, R.A., Mr. A. Waterhouse, R.A., Sir A. W. Blomfield, A.R.A., Mr. G. F. Bodley, A.R.A., Mr. J. Belcher, Mr. J. M. Brydon, Mr. W. D. Caröe, Mr. Arthur Cates, Mr. Basil Champneys, Mr. Ernest George, Mr. G. Goldie, Mr. E. W. Mountford, Mr. Rowland Plunbe, Mr. J. Oldrid Scott, Mr. J. Slater, Mr. C. F. A. Voysey, and Mr. W. White, F.S.A.

The purchase by the Trustees of the National Gallery of the two pictures by Rembrandt known as the "Burgomaster and his Wife" from Lord de Saumarez, which was announced in July last, and which it was afterwards found could only be effected by permission of the Court of Chancery, is now completed by a decision of the Court, and the pictures are placed in the large Dutch Room, No. X. Mr. Alexander Lang Elder, late of 38, Hyde Park-gardens, has presented to the National Gallery a picture of the Spanish school, "Christ disputing with the Doctors," by Francisco de Herrera the elder. This picture will shortly be hung in Room XIV.

A loan collection of 135 pictures, lent by Mr. Merton Russell Cotes, of Bournemouth, is on view at the Glasgow People's Palace. Prominent in the chief gallery is Marcus Stone's "Letter Bag," and Sir J. Gibbert, R.A., is represented by "The Timber Waggon," and other prominent works are "The Daughter of Jairus," by Edwin Long, R.A., and J. Macwhirter's "In the Cold," with a donkey as the central figure, and also Briton Riviere's "Tick Tack," showing a pug dog listening to the ticking of a watch. A specimen of the brush work of B. W. Leader, R.A., "The Lledr Valley," is also included in the collection, which likewise embraces paintings by Sidney Cooper, R.A., Fred Morgan, J. F. Herring, sen. ("Pigs"), J. Aumonier, R.I., E. Hume, Mrs. L. Alma Tadema, D. F. Langee, W. L. Wyllie, A.R.A., Yeend King, A.R.A., Erskine Nicol, and T. Creswick, R.A.

So rich in historic interest is Hever Castle, built in the 15th century by Sir Geoffrey Boleyn, great-grandfather of Anne Boleyn, that its treatment is a matter of national rather than private concern. Captain Sebright, the present owner, who is having some alterations carried out at the castle, was recently approached by the Society for the Protection of Ancient Buildings and entreated to reconsider some rumoured intentions, such as the removal of the guard-house,

and to allow a survey and a report upon the condition of the building on the lines followed by the society in the case of Haddon Hall. Captain Sebright has, however, for reasons which have not transpired, declined the society's offer.

The work of laying the underground cable from London to Birmingham to supplement the existing overhead telegraph and telephone lines is progressing steadily, and the authorities of the General Post Office anticipate its completion in the latter part of the current year. The pipes through which the cables will pass have been laid between London and Warwick, and contracts in relation to the remaining portion of the distance have been entered into, and the work is being proceeded with in three sections. The length of the new cable between the Metropolis and Fenny Stratford is already in use, and the results are completely satisfactory, the new cable having been of great assistance as a reserve during the recent gales, which tried the overhead lines severely. The cable is formed of seventy-six copper wires, and each of these conductors is insulated with a longitudinal wrapping of paper. A lead sheathing is placed over the whole, which has then a diameter of rather more than 2½in., and can be drawn through the 3in. cast-iron pipes placed at a depth of about 2½ft. below the surface of the ground in readiness to receive it.

The second volume of the annual publication of Mr. Alex. Koch's "Academy Architecture" has this week been issued to subscribers. It well maintains the excellence of the little reproductions which enrich its pages from the architectural drawings shown at Burlington House and some other exhibitions, together with a selection of foreign works and a capital series of sculptures, which give an individuality to this well-produced small folio, which is nicely printed and neatly bound. Among the contributors are Messrs. Aston Webb, G. F. Bodley, A.R.A., W. Goscombe John, A.R.A., Geo. Frampton, A.R.A., J. M. Brydon, J. Belcher, Maurice B. Adams, E. Onslow Ford, R.A., Sir Arthur Blomfield, A.R.A., W. D. Caröe, Ernest Newton, and G. H. Fellowes Pryne, P.A.A. Several of the drawings have appeared in our own pages; but that does not detract from this excellent record.

In connection with the Building Trades' Exhibition to be held at the Royal Agricultural Hall from April 26th to May 6th next, an exhibition of road-making methods and appliances, similar to one that took place two years ago, will be organised under the direction of the Surveyor. The executive committee are Mr. J. Patten Barber, chief surveyor to the Islington Vestry, and Mr. C. H. Cooper, Mr. E. J. Lovegrove, and Mr. O. Claude Robson, the surveyors respectively to the urban district councils of Wimbledon, Hornsey, and Willesden. The exhibits will illustrate road and street construction, maintenance, and cleansing, road-making machinery, tools used in road-making materials for town carriageways, covers for access to sewers, pipes or conduits, and types of lamp columns, kiosques, hydrants, and fire-alarm posts.

The curator of the Maidstone Museum has received a letter from Mr. A. Santer Kennard, of Beckenham, relating to the acquisition, by the Museum, of the Harrison collection of prehistoric flint implements, in which he states that, seeing there is now a possibility of a large part of Mr. Harrison's collection finding a home in the County Museum, provided the negotiations are brought to a successful issue, he will be pleased to present to the museum the pick of his own collection of Paleolithic implements from the neighbourhood of West Wickham, numbering upwards of 1,000 specimens. "So soon as I have described them," adds Mr. Kennard, "they will be at the disposal of the curator of the institution upon the conditions referred to above."

At the meeting of the City Council of Manchester on Wednesday, a number of recommendations were submitted bearing upon the proposed rearrangement of the city surveyor's department. The Town Hall Committee have resolved that it is desirable to divide the work of the city surveyor's office into two departments. It is proposed that there should be a head of the architectural department who would be responsible for all ordinary architectural work, and the plans and estimates in connection therewith. It is not thought desirable that this new department should be entirely severed from that of the city surveyor. The Town Hall Committee recommend that Mr.

George Meek be appointed chief architectural assistant at a salary of £270 per annum. The Rivers Committee have resolved that as the present managerial requirements of the Rivers Committee are largely chemical, they contemplate relieving the city surveyor and placing the general administration of sewage works at Davy-hulme under the control of their chemist, Mr. Fowler. The city surveyor to supervise the work of the office from time to time as may be desired by the Rivers Committee, and also to be appealed to in all cases of accident or emergency on the works. The Tramways Committee have obtained the sanction of the city council to appoint a competent engineering assistant to carry out the engineering work required in connection with the permanent way, and that he be under the control of the city surveyor.

### CHIPS.

Colonel C. H. Luard, R.E., one of the Local Government Board inspectors, held a public inquiry at the Municipal Offices, Southampton, on Thursday in last week, with respect to an application by the town council for sanction to borrow £488 for wood and tar paving, and other works of street improvement. The borough engineer (Mr. W. B. G. Bennett), explained the proposals.

John Charles, a well-known Grimsby builder, summoned James Walter Brown, at Barton Petty Sessions, on Friday, for stealing two wooden planks. The case was dismissed, but prosecutor was promptly arrested himself, however, for not having paid a fine of £5 imposed recently for an infringement of the urban district council's by-laws. A warrant had been issued for a month's committal to Hull gaol in default. Just as the train for Hull was about to depart the necessary money was paid and Mr. Charles released.

An inquiry was held on Jan. 26th, at the National Schools, Tiddington, near Stratford-on-Avon, by Major-General H. Darley Crozier, R.E., an inspector of the Local Government Board, relative to an application by the Stratford Rural District Council for permission to borrow a further sum of £1,230 (making altogether £3,500), for works in connection with the Alveston water supply. Mr. Wilcox, C.E. (Birmingham), the engineer, gave particulars of the proposals.

Proceedings at the Estate Mart, Tokenhouse Yard, last week, were very dull, and the results of transactions but meagre. The total result was only £44,580, against £238,803 for the corresponding week of last year.

At the request of Mr. J. S. Sargent, R.A., the council of the Royal Institute of British Architects have sanctioned the removal of the portrait of Mr. F. C. Penrose, past-president, from the Institute to Boston, U.S.A., to form part of an exhibition of the artist's works which is to be held early next month in that city. It has been heavily insured against accident, and will be away for two months.

At a gathering of the York Architectural Society, on Saturday, the president (Mr. George Benson, A.R.I.B.A.) said that there was a constant and increasing traffic of heavy waggons along the road which skirted the Minster from the east end to the west front. This constituted a real danger to the stability of the fabric when they considered the enormous weight of the building pressing on the ground, and the fact that already the south transept leaned outwards.

On Wednesday week, an inquiry was held at the Town-hall, Great Yarmouth, by Lieut.-Colonel A. C. Smith, R.E., on behalf of the Local Government Board with reference to a loan for £750 for the construction of an underground lavatory on Theatre Plain.

The City Court of Common Council have approved of the appointment of Mr. Henry Stock as single arbitrator, under the Central London Railway Acts, 1891, 1892, and 1894, to determine the amount to be paid for the purchase of freehold land and hereditaments in Oxford-street, South Molton-street, and Davies-street.

The death occurred on Monday, at Moret, near Fontainebleau, at the age of 58, of M. Alfred Sisley, the landscape painter. His works did not meet with proper appreciation except during the last ten years, and even now the Luxembourg is the only public museum in which one of them is to be found. He was influenced first by Corot and latterly by Monet.

The lodging-house erected in East North-street, Aberdeen, by the Corporation was formally opened on Saturday afternoon by Lord Provost Fleming and the town council. The building has cost £16,500. Accommodation is provided for men only, and the bedrooms or cubicles altogether number 252. The premises are well equipped, and fitted throughout with electric light.

### MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "Public Baths and Washhouses," by A. Hessel Tiltman, F.R.I.B.A. 8 p.m.  
Surveyors' Institution. Discussion on "The Official Supervision of Buildings in London." 8 p.m.  
"Carpenters' Hall Free Lectures." "Ornament," by Professor Banister Fletcher, F.R.I.B.A. 8 p.m.  
Society of Arts. "Bacterial Purification of Sewage," by Dr. Samuel Rideal. Cantor Lecture No. 4. 8 p.m.  
Liverpool Architectural Society. "Ideals and Realities of Modern Practice," by E. Prioleau Warren. 6 p.m.  
Leeds and Yorkshire Architectural Society. "British Plaster Work: its Past and Future," by P. Bankart. 6.30 p.m.

TUESDAY.—Institution of Civil Engineers. "The Water-works of the Madras Presidency," by J. A. Jones. 8 p.m.

WEDNESDAY.—Society of Arts. "Nernst's Electric Lamps," by James Swinburne. 8 p.m.  
Sanitary Institute. "Supply of Water to London by the Welsh Scheme," by R. E. Middleton. 8 p.m.  
Northern Architectural Association. "Notes," by J. T. Cackett, F.R.I.B.A. 7.30 p.m.  
Edinburgh Architectural Association. "Some Words about Edinburgh Architecture," by T. A. Croall, F.S.A.Scot. 8 p.m.  
St. Paul's Ecclesiastical Society. "Low Side Windows," by Philip M. Johnston. 7.30 p.m.

FRIDAY.—Institution of Junior Engineers, Joint Meeting with the Discussion Section of the Architectural Association. "Factory Design," by J. H. Pearson, M.Inst.C.E., Westminster Palace Hotel. 7.30 p.m.  
Birmingham Architectural Association. "Ancient and Modern Buildings in Palestine," by Beresford Pite, F.R.I.B.A. 6.45 p.m.

SATURDAY (FEB. 11).—London and Provincial Builders' Foremen's Association Annual Dinner at Anderson's Hotel, Fleet-street, E.C. 6.30 p.m.

## Trade News.

### WAGES MOVEMENTS.

THE PLASTER DISPUTE.—The officials of the National Association of Operative Plasterers have despatched ballot papers to the secretaries of all the London district branches. The vote of the members is requested on the single question: "Are you in favour of withdrawing the resolution compelling managing foremen plasterers to join the union?" The ballot papers are to be returned not later than Wednesday in this week, and they will be counted at the chief district office on Tuesday next. Mr. Dan Hennessey, the organising secretary of the London district plasterers, has publicly described the action of the "new unionists" as "a mistaken policy," and declared that he thought the time had arrived when these petty squabbles with employers should come to an end.

ABERDEEN.—Mr. Wm. Sutherland, the secretary of the Aberdeen Master Plumbers' Association, has sent out to wholesale merchants and manufacturers who trade with plumbers in Aberdeen, a circular stating that the members of his Association have resolved not to support wholesale merchants and manufacturers who trade with plumbers in Aberdeen who are not members of the Association. A strike affecting over 600 men commenced in Aberdeen on Wednesday, the master joiners having refused the demands of their workmen for an advance of 3d. per hour in wages—from 8d. to 8½d.

PENRYN, CORNWALL.—A labour question has arisen at Penryn. A section of the stone-dressers in the extensive granite quarries of that neighbourhood are anxious to substitute day-work for the piece system. On Saturday evening a large number of the men devoted four hours to a discussion of the subject in the Temperance Hall, Penryn. At the close of the proceedings, the secretary intimated that there was no information to communicate publicly at that stage. Probably there was never greater briskness in the Cornish granite trade than at the present time, and the demand for granite for Gibraltar, a new light-house in course of erection off the Irish coast, and important undertakings elsewhere, is sufficient to keep the staff of Messrs. Freeman, Sons, and Co. busy for a considerable period.

A large water filtration project has been submitted to the Philadelphia councils by Director Thompson, of the department of public works. It provides for filtering 270,000,000 gals. daily and a new pumping station of 150,000,000 gals. capacity on the Delaware River. Sand filters are recommended at three stations and mechanical filters at two. The cost is estimated at £2,310,000 sterling.

### BUILDING TRIBUNALS AND CONTROL.

THAT it would be wise or desirable to set up a court of censorship or taste upon buildings in London or any large city will be always a more or less vexed question. There are many who favour a power of control vested in some central authority, who should be able to exercise their power not only in enforcing good construction, but also in arranging new thoroughfares and passing elevations. For the want of such a control they point to the incongruous buildings of our new streets—to their lack of unity and harmony. These apologists can triumphantly refer to the many disfigurements of street arrangement and skyline that have been the result of street reconstruction during the last decade; that, in spite of exceptional opportunities created by disastrous fires and the demand for sanitary rehousing, little or nothing worthy of any great Continental capital has been done in London. But there are many more who regard personal freedom as the heritage of every Englishman; who persistently refuse to be tied to regulations imposed by any authority, or to be dictated to in any question of design. They draw a fast line between statutory interference and any opinion. Yet there is some degree of inconsistency in this. The very men who openly repudiate any suggestion or opinion of others better able to judge of merits than themselves quietly submit themselves to the yoke of compulsory law. They will submit to strict by-laws enforced by civil authority on such points as foundations and thickness of wall and sizes of timbers, but will not listen to the good counsel of men who may suggest an improvement in an elevation. And all heated controversies have proved, as in a recent agitation, that there are many, even in art circles, who would force legislation on everybody else but themselves. They revel in licenses; like to have their own way in matters of construction and taste; erect buildings of the most eccentric character; but would not allow the slightest freedom to those they differ from in questions of taste. The more undisciplined the builder the less is he inclined to acknowledge his own shortcomings, or allow others his own freedom. These are reasons which have made it difficult to propose any tribunal of taste. Municipal authorities have now to decide upon a variety of matters connected with building, and in many cases their discretionary powers are called into requisition. When we consider the vast number of applications and building questions that come before the London County Council, we begin to see that considerable discretionary powers are necessary. In questions of frontage lines and projections alone, the work is very heavy, and considerable judgment is called for. There is a Tribunal of Appeal, before whom questions can be argued, composed of competent men—one architect, appointed by the Institute; one surveyor, appointed by the Institution of Surveyors; but that it combines the necessary qualifications in every case is doubtful.

A very interesting paper by Mr. David Lyon was read last week at the Society of Architects, on "The Supervision and Regulation of Building Operations in Edinburgh," a report of which we published in our last issue. It describes the present constitution, jurisdiction, and functions of the Dean of Guild Court, and is worth attention by all interested in building regulation and supervision. The

section dealing with the cases submitted to this court shows the wide extent of the powers conferred on the court, and there are some things that we should like to see adopted here. The Dean of Guild Court is practical, the men composing it are men well versed in building regulations and requirements, their decisions carry weight, and it is capable of dealing with questions without delay. A warrant of court is required in every case of erecting buildings, of altering any existing building, of using any building not originally built for human occupation. A petition in each case for warrant is to be lodged with the clerk of court, and this is required to set forth full particulars of the building or intended alteration, and be accompanied by plans of site of adjoining properties, the width and particulars of streets or courts, pavements; plans, sections, and elevations of the building lines, of drainage, relative levels of drains, sewers, &c., arrangements for heating and ventilating, ingress and egress of buildings for public resort, and these drawings are to be to a large readable scale. But the most important point to notice is the registration of the petition and plans. These are to be registered and indexed, and these registers and indexes are to be open for inspection by any owner or ratepayer upon payment of a fee of 1s. If the new building does not affect the property or rights of other owners, the court can remit the application of any building owner to the master of works, who can grant warrant for the execution of the alterations, which are to be executed to his satisfaction. These provisions appear to be more thorough and simple in operation than those of the London Building Act: there is less opportunity for misunderstanding and friction; the adjoining owners can make any objection they like before the building is commenced, and if there should be any interference with or obstruction of light and air, it can be at once detected. And this seems to be the great advantage of the Edinburgh system of building regulation over that of London. It prevents, because it renders impossible, any dispute and waste of time and money in litigation. The Guild Court examines and proves for itself the facts of every case, and therefore expert evidence is not required. A builder or owner who wishes to argue or dispute on trivial questions cannot do so. His plans and views are submitted to a competent tribunal who have powers to carry out their own decisions, instead of leaving every would-be litigant to act for himself. He, in fact, is thus saved from his own rashness or precipitancy.

In alterations of a trivial or minor kind, the submission of a simple sketch accompanied by a descriptive letter, is all that is required, thus saving unnecessary labour to the officials and trouble to owners. But what we particularly wish to notice is the exercise of some control over the external design—as far, at least, as the choice of material is concerned. The Dean of Guild Court requires that all persons shall set forth the material proposed to be used in the construction of the elevations of any building. In this direction the court certainly goes beyond that of other authorities, because it assumes a control over the architectural treatment. By making every building owner name the material to be used, it naturally implies that it has power to veto any objectionable material—say, for example, that of brick. Stone is, of course, in favour in the Northern capital. But material involves treatment, and the court exercises, at least, its influence in persuading speculative builders in this direction, but it does not go beyond persuasion. Any arbitrary control will be out of the question, even in Edinburgh, and one may be sure in London any dictation as to style, or even material, would be repudiated.

The London County Council have before them many buildings, the requirements of which are by no means incompatible with artistic construction. Take, for example, the buildings intended for housing the labouring classes. These are, to say the least, very commonplace and depressing-looking buildings, with high walls of brick pierced by square openings, generally flatly treated, and without relief or agreeable skyline. At Clerkenwell, Bethnal Green, Blackfriars, Camberwell, and other thickly-populated parts, these buildings are exceedingly repulsive, and it would be a public benefit if more pleasing and less sordid-looking elevations were made a condition of their erection. The design of elevations of houses on new estates like that of Millbank, for example, ought not to be left entirely to the speculative builder, and in new and widened streets care also should be exercised in the elevations of commercial buildings and rows of houses. Although any arbitrary power would be out of the question, influence might be brought to bear as to the proper treatment of building material, and any objectionable features disallowed. A tribunal capable of dealing with elevations in their general features and of estates would become a public boon to the Metropolis.

### MODEL SPECIFICATIONS.—LI.

GLAZIER—PAINTER.

COLOURED varieties of glass are chiefly muffled or rolled, and are about  $\frac{1}{16}$  in. thick; but care should be used in selecting the particular kind required, or in specifying the name of manufacturer, and of obtaining samples.

One kind of rough plate is made in which wire netting is imbedded on the glass, which is a great security in case of fire, as the network prevents the cracked pieces from falling out, and holds them together. For roofs, conservatories, and the glazing of windows where clear glass is not so much required as strength it is useful. The "Luxfer" copper electro-glazing already referred to, supplied by the British Luxfer Prism Syndicate, Ltd., is ornamental in appearance, and the prisms are made to suit all situations as regards light, and in ornamental patterns. These electro-glazed plates are very strong, and can be used for lean-to and ornamental purposes. The bars or small ribbons of copper which hold the glass prisms, when subjected to the action of the electric bath, clench the glass quarries, the deposit of copper acting as a self-made *came*, securing the glass. For this reason the copper electro-glazing is better adapted than lead glazing for the upper sashes of office windows and ornamental panels.

18. *Glazing of Panels.*—Fill in the panels of screen (or door) with stout lead-light glazing, the irregular and ornamental panes being made to carefully-prepared templates. The glass to be 21oz. sheet in quarries, or 16oz. "cathedral" glass, banded and fixed and pinned with copper wire to frames; or Nicholls and Clarke's "Figure rolled" pattern A; or specify the panels to be supplied by Williams Brothers and Co., Chester, or other manufacturers.

19. *Cathedral Glass.*—The panels of doors to be filled with Young and Marten's "cathedral" glass squares, with two ornamental roundals, or centre pieces, 3ft. super. each, as per design, and with coloured border; the lights to be secured to  $\frac{1}{2}$  in. round saddle-bars. Or—

Fill in panels with 16oz. (or 21oz.) "pot metals," of tints to be selected, in squares, set in leaded frames, and secured by saddle-bars 16 in. apart.

20. *Quarry Rolled Plate.*—The panels of screens in buffet to be glazed with patent quarry rolled plate, small pattern,  $\frac{1}{16}$  in. or  $\frac{1}{8}$  in. thick, bedded in wash leather, and secured to rebates by beads; screwed to frames; or specify Nicholls and Clarke's rolled quarry (Nos. 1 or 2).

21. *Lead Lights to Vestibule Doors.*—Glaze with lead lights according to design, and muffled glass in varied tints, and with narrow clear glass border,

the vestibule screen and door, bedded in white-lead. The lead lights to be fixed with stout copper wire bands to wrought-iron saddle bars  $\frac{1}{2}$  in. diameter, fixed not more than 16 in. apart.

The windows marked in elevation to have wrought-iron casements, section 1, quality 2, supplied by Burt and Potts, bedded in white lead.

(It is desirable to supply all necessary templates for the glass, and these should be checked before being sent.)

22. *Quarry Glazing.*—Glaze the traceried windows of church with quarries and borders in strong lead  $\frac{1}{2}$  in. wide, the leadwork to be secured to the saddle bars and stanchions with strong copper wire soldered to lead and securely twisted round the saddle bars. The glazing to be securely cemented and let into grooves of stonework, neatly pointed with lime and stonedust. The glass to be Powell's quarries or rough cathedral glass  $\frac{1}{2}$  in. thick, of tints to be selected.

23. *Ornamental Glazing.*—The panels marked A to be glazed with ornamental sand-blast designs, bedded in washleather, and screwed to rebates with beads. Glaze the upper panels of framed screen and vestibule with the "Luxfer" prismatic window glass, ornamental design selected, or according to design; the work to be done by the British Luxfer Prism Syndicate, Ltd. Or—

Glaze the panels with enamelled glass (or with quarry rolled rough plate), small pattern,  $\frac{1}{2}$  in. thick, cut to squares 8 in. by 6 in. or other size; or with diamond rough plate in relief patterns, as design; or with Muranese glass, "tinted Mediaeval rippled," or Venetian rippled glass, fixed in lead comes to design, or in the wood rebates, secured by screwed heads.

24. *"Invincible" Glazing to Roofs.*—The roofs of conservatory or glazed corridor to be glazed with Rendle's Patent "Invincible" system of glazing, according to details supplied, and according to directions of W. Edgcombe Rendle and Co., of Victoria-street; or specify the section of "Invincible" bar and the size of the wood core, the length of glass up to 10 ft. width between rafters, and the metal cap, whether of copper or zinc, water-channel and inside gutters, how finished at ridge and eaves. (It is best to supply detail drawings, or provide a p.c. sum in specification for the glazed roofing.)

The sketches we give illustrate Rendle's patent "Invincible" glass roofing. Section 1 shows the bar on moulded wood core, the glass and the mode of finish at end. Fig. 2 shows how a slated roof finishes over the skylight, and the form of flashing over tilting fillet. If instead of slates the roof is entirely of glass, a drip is formed, with metal stop screwed to wood drip, to secure end of glass sheet. Fig. 3 shows the lead or zinc ridge capping which covers the glass on each side. Details half full size are supplied by Messrs. Rendle and Co.

#### THE PAINTER.

This is a trade in the exercise of which there is much opportunity to disregard the provisions of the specification. Without a clerk of works it is not possible to be sure whether the work has received its specified number of coats, and as a check, it is sometimes required that there should be a different tint for each coat. Wood and plasterwork ought to have four coats of paint in ordinary cases; for superior work six or more coats. Ironwork should have at least three coats, and boiled-oil should be used for outside painting. Some preliminary knowledge of materials—such as white-lead, linseed oil, "driers," turpentine, &c.—is necessary to write a painter's specification, and we refer the reader to "Notes on Building Construction" and other textbooks. Woodwork should be thoroughly dry before being pointed, and be clean and smooth; the knots should be "killed" by painting them over with "size" or "patent knotting." Sometimes knots are covered with fresh-slaked hot lime for a time and then scraped off and painted with "size knotting," or they are coated with red and white lead in linseed oil, and after rubbed smooth with pumice; or in good work knots are covered with gold or silver leaf. The primary coat is laid on next, composed of red-lead or white-lead, which fills up the pores of the wood, and

sets hard. Red-lead is used as a drier. After "priming," the wood should be rubbed down with fine sand paper or pumicestone, and holes and cracks stopped with putty. The second and third coats are then applied; after the latter is dry, the work is rubbed down to receive the finishing coat. Flattening is sometimes added for interior work, and this coat is mixed with turpentine only, a flat dead surface is thus produced. Sometimes it is mixed with a little copal varnish, which makes it more durable.

For outside work boiled oil should be used. Describe if any special iron paint is to be used such as Torbay paint, and if any special solution is to be used for stone or plaster work as Szerelmey's stone liquid, or the Bath Stone Firms' (Limited) "Fluate." For ironwork red-lead and linseed oil or oxide of iron paint is used; all rust should be removed by files or wire brushes and petroleum. Castings should be primed before being exposed to the weather, and cement should not be painted within two years of its completion. For grained work four or five ordinary coats are necessary, the last of equal parts of oil and turpentine of the tint required. Then glazings of different tints can be applied; these may be ground in water and mixed with small beer. For oak graining the colour is mixed with turpentine and turpentine varnish, and the surface, while wet, combed to imitate the grain of the wood, and knots made by the fingers. "Overgrained" work has a glaze of colour in beer laid over the combed work in shades.

For painting plasterwork the walls may be distempered, and then left for two years before painting, then brush the distemper down and paint; or prime the plaster with glue size to prevent absorption, and then paint four coats of lead paint. Plaster may also be primed with two coats of boiling linseed oil, and when dry cover it with a thin coat of weak size tinged with red lead to stop all absorption, and then finish with two coats of oil paint and a flattening coat.

For varnished work a smooth surface is necessary. Apply four coats of paint, after them give two coats of French oil varnish or pale copal, between each coat felt surface with pumice powder till the desired finish is obtained.

1. *Materials.*—The materials to be of the best quality. The oil colours to be made with best old white-lead and pure linseed-oil, mixed on the building. The varnish to be the best copal.

2. *Generally.*—All the tints to be approved by the architect, and each coat to be of a different tint. Rub down with sandpaper, and stop between each coat; knot, prime, stop, and oils all the woodwork not otherwise mentioned. Or—

Knot, pumice down, smooth, stop, and prepare all woodwork, externally and internally, usually painted, and prime and paint same four coats in two or more shades.

3. *Priming.*—The whole of the woodwork to be glasspapered, knotted, and primed with lead and oil priming, and well stopped.

4. *Notice to Architect.*—The contractor is to give the architect written notice of each separate coat of paint, &c., before applying to wood, iron, plaster, and separate notices to be given for both exterior and interior work. Or—

5. *Samples.*—The painter to prepare sample tints, and submit the same to architect for his approval.

6. *External Woodwork.*—All external woodwork, doors, sash-frames, &c., to have two coats of oil colour before being fixed, and two coats after fixing.

7. *Internal Work.*—The internal woodwork to have four coats of oil colour, except where otherwise specified.

8. *Special Work.*—The woodwork of drawing-room (or boudoir) to have two coats of oil colour and two coats of white enamel. Or—

Finish the reception-rooms and best bedrooms in party colours, with the mouldings of panels, architrave, and skirting picked out in a separate tint approved by the architect.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ordinary meeting of the Royal Institute of British Architects was held on Monday evening, the President, Professor George Aitchison, R.A., in the chair.

#### THE PROPOSED ROYAL GOLD MEDALLIST.

THE PRESIDENT said that the Council had decided to recommend to her Majesty, under by-law XI. as the recipient of the Royal Gold Medal in Architecture for 1899, the name of Mr. George Frederick Bodley, A.R.A. (Loud applause.) By the cordial reception just given to the announcement of the nominee of the Council, he felt sure that the members would be practically unanimous in endorsing the selection for that honour of so admirable an architect and so excellent a man as Mr. Bodley. A letter from Mr. Bodley intimating the pleasure he should have in accepting the honour if offered, was read by the secretary, Mr. W. J. Locke.

#### PUBLIC BATHS AND WASHHOUSES.

A paper upon these subject, illustrated by a number of plans, sections, and elevations, and a few photographs of Continental and English baths, was contributed by Mr. A. HESSELL TILTMAN, F.R.I.B.A. The illustrations included the establishments in Kennington-road, Hornsey-road, and Tibberton-square, all designed by the author, and various "people's" and public baths at Hamburg, Stuttgart, Vienna, and other Continental cities. Owing to indisposition and increased deafness, Mr. Tiltman, although present, was unable to read his paper, and his place was taken by Mr. W. J. Locke, the secretary. Mr. Tiltman explained his personal views upon the ordinances which should govern the arrangement of baths and washhouses in the future, and their influence upon the arrangement and details of their various departments. The Baths and Washhouses Act, 1846, was passed "to encourage the establishment of public baths and washhouses." Under this and amending Acts a large number of these establishments had been erected. The municipal duty, however, of providing facilities for the cleansing of the bodies and linen of the poor had not been adequately performed. Statistics showed only a small proportion of the class for which these establishments were chiefly intended availed themselves of the opportunities

offered. The reasons for this partial failure the author considered were—first, that the initial distribution and classification of the establishments were frequently at fault; secondly, sufficient effort was not made to educate the masses as to the necessity and benefits of the bathing habit. The bathing community to be catered for consisted of the middle class, the working class, and the very poor. A great initial blunder was committed in associating these, in large proportions, for all purposes of swimming, bathing, and washing, in almost every establishment. The remedy lay in the practical adoption of some system of central and branch establishments, classified and distributed to suit the special needs of each district.

#### ABLUTIONARY BATHS AND PUBLIC WASHHOUSES SHOULD BE DECENTRALISED,

and located at much more frequent intervals throughout those districts requiring them, forming a series of branch establishments; whilst swimming-baths should constitute centralised establishments at one or more points, equally dividing up the whole district. The author then enumerated the requirements of the suggested establishments. The central establishment should be the chief and most attractive. The branch establishments should consist of two types: (1) baths and washhouses; (2) people's baths. Either type could be put upon the site of from two to four small houses in a by-street, which would be neither costly or difficult to acquire. In extending the provision of baths and washhouses the authorities should consider the advisability of doing so in the direction of branch rather than central establishments. The author had visited and inspected a very large number of baths and washhouses throughout the United Kingdom, and in France, Belgium, Germany, Austria, and Hungary. In Germany he had found much to admire in the arrangement and administration of these institutions by the State, and the true spirit and intention of the Baths and Washhouses Act would be much better carried out if that part of the German system were adopted. A committee of medical and other experts in New York, after careful investigation, had reported their preference for the arrangement and administration of the new form of German and Austrian

#### PEOPLE'S BATHS.

The distinguishing features and hygienic advantages having been fully explained, the author went on to describe the plan and arrangement of each of the three classes of typical establishments advocated by him. The central establishment site should have a superficial area of from 30,000 to 40,000sq.ft., be in a prominent position, and easily accessible from all parts of the town or parish. It should admit of the perfect drainage of all portions of the establishment without necessitating an expensive treatment of levels of the building generally. Much saving may be effected by having only a small frontage towards the main thoroughfare. A good site may often thus be secured, carrying with it sometimes sufficient frontages to back streets, where minor entrances may be provided. In baths carried out for the Islington Vestry the author had adapted

#### THE QUADRANGULAR SYSTEM

to such a site as that described with excellent results. The water supply must be abundant, pure, and soft. It should be sufficient to meet the largest demands, and include a storage for some 15,000 to 20,000 gallons. Ponds of very large size are not advisable. It is better to increase their number rather than their dimensions, when the latter exceeds 90ft. by 30ft. Five is a useful number for central establishments—two for each of the sexes, and a fifth or small pond to be used alternately for both sexes, principally as a teaching pond. In England swimming-baths were usually closed during six months of the year; but, with adequate warming and other arrangements—as in Germany, where, though the climate was much colder, swimming-baths were open all the year round—swimming clubs would gladly use them throughout the winter months. The arrangement of one of the swimming-baths during the winter months for public entertainment purposes was next considered, and the best means of meeting the London County Council requirements in the matter of exits, &c. Taking into account costly sites, the extra space secured, the advantage to exterior architectural grouping. The author preferred to distribute the baths between the

ground and first floors, and, if proper lighting can be obtained, the basement as well. Much accommodation is lost and convenience sacrificed by keeping all the slipper-baths upon one floor. The location of hot-air baths, laundry, boiler-house, and engine-rooms, apartments for superintendents and engineer, &c., having been indicated, the author went on to deal with the details affecting the various departments—viz.: swimming-baths for both sexes, douche or cleansing-rooms, slipper and rain-douche baths, hot-air baths, the establishment working department, boiler-house, engine-room, accumulator room, receiving-room, washhouse, drying-room, folding and distributing store-rooms, mess-room, engineers' workshop, and the administrative department.

#### A DEFECT REQUIRING CORRECTION

in English swimming-baths was the insufficiency of dressing-box accommodation in proportion to the superficial area of pond surface. The almost universal arrangement of placing the dressing-boxes down two sides and possibly one end of the hall ought to be improved upon. This might be done by adopting the Continental method of placing an equal proportion of the dressing-boxes or places upon the gallery floor, or by arranging them in a series of transeptal bays upon one or both sides of the bath. The pond should be rectangular in shape, and in the proportion generally of length to width as 3 to 1. Steps to the water should be of wood, and made removable. An open self-draining channel, close to the top of the pond and running continuously round it, serves as a scum overflow and spitting-trough, and at a suitable height above the water-line an iron or copper safety rail should run all round the pond for the use of tired swimmers. At the shallow end, a portion of this rail is usually converted into a spray-pipe, extending the whole width of the pond. By raising or depressing the direction of the perforations in this, a useful and pleasant means of freshening and clearing the top surface of the water is obtained. Further points considered in this connection were the depth and temperature of the water, gangways round the ponds, flooring materials, dressing-boxes and their fittings. An important feature of the swimming-bath should be the douche or cleansing room. This is almost unknown in this country in connection with swimming-baths; but it is a universal provision of the German baths, and used by every bather as a matter of necessary routine, it being understood that before entering the swimming-pond he should, out of consideration for his fellow bathers, undergo a thorough cleansing process.

#### HOT-AIR BATHS

should be upon the lines of the improved form of the Anglicised Turkish bath, consisting of three rooms—viz., the tepidarium (140° Fahr.), the caldarium (180° Fahr.), and the laconicum (250° Fahr.)—together with a combined cooling and dressing-room, and a shampooing and douche-room. For the second-class hot-air baths the author recommended the system suggested in Metcalfe's "Sanitas Sanitatum et Omnia Sanitas," which consists of a combination of hot-air rooms of the Turkish bath, with a system of warmed lavatories in lieu of the shampooing process and plunge bath. This modification of the Turkish bath, for ordinary purposes of ablution, would be perfectly effective, less provocative of colds, and more economical than the ordinary warm slipper-bath. In considering the second part of his subject—

#### PUBLIC WASHHOUSES,

the author said that their present arrangement required complete overhauling. Full details of a small installation were given as an indication of the line the new modification should take, and it was urged that among the rooms provided in such an establishment should be public washhouses, mangling-room, waiting-hall, cloak and bonnet room, crèche, and ticket-office. Reverting to bathing establishments, the author explained that the smaller type of his branch establishment—viz., people's baths—was intended to meet, in the cheapest and simplest manner, the needs of the very poor for cleansing facilities. It consisted of very small establishments of rain douche baths, built at very frequent intervals, in the poor and populous districts, after the manner of the Germans and Austrians. These establishments could be made so small and compact as to permit of their erection at frequent intervals under our streets in a manner similar to

our underground lavatories and conveniences. Finally, the author touched upon the questions of construction and architectural treatment. Construction should be of such a character as to resist the action of water in every form, whether from carelessness or from the necessities of frequent cleansing. It should be easily kept clean, free from vermin, and especially so with respect to the transfer of contagious matter. As to external architecture, the design of the building should clearly express its purpose, quite apart from all questions of style. It should appear exactly what it is, and not ape the dignity and expression of the modern town hall. In the treatment of the natural outcome of the plans themselves there are infinite opportunities for original and distinctive arrangement peculiarly suitable to the purpose of the structure.

Mr. WILLIAM EMERSON, hon. sec., proposed a vote of thanks to Mr. Hessel Tiltman for his very careful and useful paper. One point on which he should have liked some information had been entirely omitted—namely, the best method of specifying and securing that a large swimming-bath should be absolutely water-tight.

Mr. H. L. FLORENCE, vice-president, in seconding the vote of thanks, remarked that while the paper had given them much information, it did not afford so much scope for discussion as most of the subjects which came before the Institute. He did not quite understand how the arrangement for rain-water douches to be used before entering the public bath was carried out, but it was obvious that if the system were to be generally adopted in this country it would necessitate a revolution in the accepted mode of planning such establishments. The dressing-boxes would have to lead into the douche baths, and would also need to be as accessible as at present to bathers emerging from the swimming pond, while the present pathway round the pond would be quite as essential as now. Unless the dressing-boxes only had an exit through the douche-bath, there would be no guarantee that it had been taken. He differed from the author in his recommendations to use York paving for walling and the pathway round baths. His experience was that slate was a pleasanter material to touch and walk upon, and was more easily kept clean.

Mr. A. T. BOLTON said one of the chief difficulties in London was to make public baths self-supporting. In many cases in the Metropolis public baths formed substitutes for suburban town halls throughout the winter months, and that necessitated the special planning of entrances and exits. If the managers of baths could be consulted, they would one and all be in favour of maintaining the baths for their primary purpose, and if they could be used, as in Germany, all the year round for bathing purposes, it would certainly simplify the problem of planning them for architects, and also be acceptable to managers. One objectionable feature in many baths, notably in those at Westminster, was the great noise arising from the reverberation of every splash or cry, and this, he believed, resulted from the excessive amount of glass in the roof reflecting the sounds back upon the surface of the water. The remedy was to restrict the glazed area to coves and a central lantern-light. The overhead shower had been introduced at Westminster and elsewhere; but it was found that bathers were very sensitive to falling water, and objected to going under its spray. If a refreshment-room or teashop could be introduced under the same roof as an adjunct, and let out to a caterer, it would be remunerative, and would also be appreciated by bathers.

Mr. A. SAXON SNELL remarked that he had to read a paper at the Architectural Association three weeks hence, and realised that Mr. Tiltman had exhausted his subject in the very able paper read that evening. He regretted that more plans of English baths had not been published, and were not shown that evening. The new swimming-bath at Shoreditch exhibited a very great stride onwards, and proved that even vestrymen had come under the spell of imagination, and if members of our local governing bodies began to dream dreams, and see visions, the prospect for architects was good. One way in which baths could be managed economically was to utilise them alternately for different sexes; women preferred to visit baths in the mornings, and men were most free in the evening. He agreed with Mr. Tiltman that the aim should be to reduce the size of baths, and localise these establishments; people had a great

objection to going long distances to and from baths. He hoped to see a great increase in the number of rain water shower-baths—a system which had been introduced with great success of late by a manufacturer in the North of England, for the benefit of his workpeople. The separate entrances for men and women ought to be abolished; they were as unnecessary as similar arrangements would be at a railway station. The size of the swimming-pond was usually much too great; the large amount of water required to fill it was a costly item, and, for racing purposes, 100ft. by 55ft. was the maximum dimension required. For convenience and economy of management, all the slipper-baths should be arranged on one floor—the first; tiers of slipper-baths necessitated the employment of separate attendants on each floor. He could not concur in Mr. Tiltman's objections to rounding the corners of baths, but it was not desirable to do more than round off the mere angle; nor did he agree with his wish to abolish the doors of dressing-boxes. Wood-work should be employed for all doors and fittings as far as practicable, and there were now on the market two or three paints for wood, which were perfectly impervious to water, and would bear washing.

The PRESIDENT then put the vote of thanks, which was carried by acclamation, and briefly acknowledged by Mr. TILTMAN.

#### THE ARCHITECTURAL ASSOCIATION.

THE ordinary fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the President, Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the chair. Messrs. F. J. Palmer, J. H. Taylor, and A. S. Vernon were elected as Members.

##### THE MAKING OF STAINED GLASS.

Under this title Mr. CHRISTOPHER W. WHALL gave a running commentary, or, as he styled it, a "work-bench talk" on a practical process of the mode of making stained glass. The address was illustrated by examples of work executed by the lecturer's pupils at the Central School of Arts and Crafts in Regent-street, and also by Mr. Whall's own cartoons. The lecturer asked the members at the outset two questions: What do you want to know about stained glass? and, secondly, Why do you want to know? In other words, he wished to inquire the reason why and the degree in which young architects should interest themselves in the crafts, of one of which he proposed to speak that evening. Mr. Whall proceeded to describe the processes which led to the actual production of a stained-glass window. A small sketch having been made for the client, it was, when approved, reproduced as a full-sized cartoon, and this cartoon must necessarily be made by one who was fully acquainted with all the processes which were involved in stained-glass work, and who realised to the full its limitations. The cartoon, when made in outline, was indelibly set with spray, and then the remainder of the working lines were drawn over it with charcoal. A tracing is next made showing only the leading lines, and from this tracing the entire work was executed. The glass was laid upon it and cut to the pattern, space being allowed for the leadwork, and then it was painted. All the important features were laid down on the cartoon and traced with the pigment—oxide of iron combined with flux. The tracing completed, the pieces were waxed up and placed on a glass plate below which was a light. The actual painting was then commenced, an opaque pigment being laid on with an even surface, and then brightened with stumps of hog's-hair brushes. The firing followed, the pieces being taken off the plate, the wax chipped away from the edges, and the whole was laid on trays and passed into an intensely heated kiln. The whole question of the permanency of the colour depended not upon the pigments used, but upon the sufficiency of the firing. The paint had to be executed twice as dark as it would appear when finished, much being lost in the firing, and sometimes a second painting was required, and then it had to be refired. The window was now complete with the exception of the yellow stain. This pigment was perfectly permanent when subjected to dry and low heat, and any required shade could be obtained between primrose and ruby. For the obtaining of good effect in stained glass, white—pearly white—was essential; speaking for himself, he did not approve of the windows recently

so frequently executed, in which the highest white was a greenish-grey. The next step was to lead out the work; the window was fitted together in a similar way to a child's puzzle, on the bench, and the lead was put round each piece, fixed in position by horseshoe nails, and then fixed with solder. The window was, last of all, rendered hard, stiff, and waterproof by being cemented. Mr. Whall continued that there were several practical questions in reference to stained glass, which would appeal to his audience as architects. The specimens were not examples of his own work, but of that of his pupils at the Central School of Arts and Crafts in Regent-street—not the designs in all cases, but the actual handicraftsmanship. Such work would give pupils a sympathetic knowledge of the craft, and, he thought, supplied an answer to the question how far it was possible for an architect to take up any craft to a useful end. It was, he fancied, impracticable that an architect should so take up a craft as to become master of it; but a good deal might be learnt in a short time, and it was certainly good and proper that whatever might be the architect's position as director in the matter, those who actually produced a thing should know how to do the whole of it themselves. They were endeavouring to do this in the Central School. In the Central School pupils were taught design and the craft on alternate evenings; this method had a good influence on their work, and had brought out much originality. In this connection the lecturer showed a portfolio of designs made by his pupils in the Regent-street School.

A short discussion followed the delivery of the address, in which Messrs. FRANCIS BOND, HAMPDEN W. PRATT, FRANCIS G. F. HOOPER, A. S. FLOWER, D. F. FYFE, MATT. GARRETT, and T. G. LUCAS, and the PRESIDENT took part, and a cordial vote of thanks was accorded to the lecturer.

In his response, Mr. WHALL replied to Mr. Hooper's drastic criticisms of the portfolio of students' designs from the Central school, pointing out that not all of the designs were for complete leaded lights, but were in most cases patterns made for diapers, apparel, and jewelry in robes, for quarries, canopy, and architectural details, which entered so largely into the production of figure-work in stained glass. He concluded by inviting the members of the Association to inspect some of his own figure-work which he was executing for Gloucester Cathedral at Messrs. Lowndes and Drury's, 35, Park-walk, Chelsea, on Saturday and Sunday, the 18th and 19th inst., between the hours of 2 and 5. Stained-glass work in progress might also be seen by any architect interested in the subject if he cared to pay a visit to the Central School of Arts and Crafts on any Tuesday, Wednesday, or Thursday evening between 7 and 9 o'clock.

#### THE SUPERVISION AND REGULATION OF BUILDING OPERATIONS IN EDINBURGH.\*

(Continued from p. 157.)

I NOW propose to deal with the manner of bringing cases into court, and with the procedure there, and I shall begin by describing the petition, which is the foundation of all proceedings there. This petition is prepared in accordance with an Act of Sederunt of our Supreme Court, which prescribes the forms of procedure in courts of Royal burghs. It is, therefore, a paper which would properly be drawn by a lawyer; but for convenience a printed form is issued by the court which may easily be filled up by any intelligent person. It consists of three parts:—(1) The petition proper; (2) a statement of facts; and (3) the pleas in law. The first portion describes the proposals of the petitioner, and also contains a list of the neighbouring proprietors and others whom the petitioner may consider have an interest in the proposed operations, including in each case the Lord Provost, magistrates, and council of the City, and craves an order of the court to serve a copy of the petition on these respondents, as they are called, and to ordain such as have objections to the petition to lodge a note of these within a specified time after service of the petition, the time usually fixed being four days. The second portion, the statement of facts, describes the property to be built, or ordered, with its boundaries, and states that the respondents

enumerated in the petition are the only parties interested in the proposed operations. The third portion, the pleas in law, contain what may be described as the legal propositions of the petitioner. The first is, that as the operations proposed are confined to the petitioner's own property, and can be executed without danger, the petitioner is entitled to warrant as craved. The second is one which you will find at the end of all judicial petitions of this kind, and is to the effect that any one opposing the application should be found liable in expenses. The clerk of court having received the petition and plans, writes the necessary order for service on the petition, which is then put into the hands of the officer of the court, whose duty it is to serve a copy of the petition on each of the respondents named in it. A copy of the petition is in each case served on the town council, and this seems the most convenient place to make clear the position of the town council or corporation in the Dean of Guild Court. In the corporation is vested all public rights and property, and among the rest is the right to the solum of the streets; they have, therefore, naturally an interest to see that public property is not to be encroached on in the course of any building operations. But, besides this, the corporation has various statutory powers giving them the control of the laying-out of new streets and of the height of the buildings to be erected in them, and also of the height of existing buildings which are being enlarged. It has to be satisfied that public sewers are not to be interfered with, that bakehouses and dairies are being constructed conformably to its requirements, and generally that the provisions of the Municipal Acts bearing on such matters are being observed. The reason, therefore, for the corporation being a respondent in each case will be evident to you; but it comes into the Dean of Guild Court just on a par with any other objector, and must maintain its rights there in the same manner as any other respondent. After service of the petition has been made, the clerk of court must give notice to the burgh engineer, whose duty it is, before the petition is heard, to report to the court whether, in his opinion, the plans are in conformity with the provisions and requirements of the Edinburgh Municipal and Police Acts, and this report is submitted to the court when it meets to consider such petitions and plans. Between the time of the service of the petition and the first meeting of the court thereafter, the respondents are expected to examine the plans of the operations in which they are interested, and to formulate their objections, if any, and for the corporation the plans are examined by the city architect. He makes a report of any objections he may have to the town clerk, who represents the corporation in these proceedings. The court sits weekly all the year round, with the exception of the months of August and September, when the meetings are held fortnightly. Before the court sits in public, the members meet and consider all applications, so as to inform themselves as to the proposals of petitioners, to go over the plans, and to receive the reports of the burgh engineer. Each case is carefully considered, and notes are made by the Dean of Guild as to whether or not the plans are such as may be passed, and also of any improvement in architectural detail or internal arrangement which the court may desire to suggest. The public court is then held at a fixed hour. The clerk calls a case, and the petitioner or his law agent, and usually his architect, appear at the bar. If the plans are all in order, warrant is granted without comment. If there are only some slight alterations proposed either by the court or by the petitioner to meet the objections of the respondents, who are also expected to attend at this time, the matter may be adjusted at the bar and the plans passed. If, however, the objections either by the court or by a respondent are vital, the case is usually continued to allow the petitioner to decide whether he is to abandon his petition, to modify his plans, or to insist on his position and prepare to fight the case.

##### THE LEGAL PROPOSITIONS OF A PETITIONER

are these: This is my property; the proposed operations are confined to that property; they can be executed with safety; therefore, I am entitled to warrant. The objections which may competently be stated against these propositions are separable into two classes—legal and practical. Into the first category fall the objections usually taken by neighbouring proprietors—viz., that

\* Abstract of a paper read before the Society of Architects on Thursday, Jan. 26, 1899, by DAVID LYON, Clerk to the Edinburgh Dean of Guild Court.

the property does not belong to the petitioner, that the operations are not confined to his own property, or that they will interfere with some right or servitude belonging to the objector, and also the objections competent to a superior that the conditions of the feu charter are not being complied with. In order that you may understand the terms "superior" and "feu charter," let me explain that in Scotland leasehold of property is almost unknown, in the sense in which the term is used here. The tenure of heritable property with us is almost wholly feudal. The owner of land in Scotland is called the "superior," and when he disposes of a portion of his ground for building purposes, he does so in terms of a feu contract entered into between himself and the intending builder, who becomes in law his vassal. This vassal binds himself and his heirs in perpetuity to pay to the superior and his heirs an annual ground-rent or feu duty as the consideration for being allowed to erect a building on the ground; but the right of property in the house or building belongs for ever to the vassal, his heirs and successors. Of course, in granting this feu charter or contract, the superior may impose such conditions on his vassal as he may consider desirable. He may prescribe the class of property to be built—in the case of dwelling-houses whether they shall be villas or tenements—or, as is often done in Edinburgh in streets of high-class houses, he may insist on the elevations being built to conform to a particular design. He may prohibit the carrying on of any trade or manufacture in property on his ground, and he may constitute a servitude of light and prospect over one house or building in favour of another. As it is a matter of considerable importance to anyone interested in building operations in towns, perhaps I might at this point inform you as to the Scots law in reference to

## SERVITUDES OR EASEMENTS.

First let me explain that the tenement having right to the servitude is called the dominant, that subject to its burden the servient. Prædial servitudes, as servitudes attached to heritable property are called, are either positive, where the dominant proprietor has right to exercise some right; or they are negative, where he only restrains the servient proprietor; and negative servitudes cannot be acquired by possession, but are constituted by title alone. The owner of a servient tenement is only bound to suffer; he is under no obligation to do any act. He must do nothing to limit the servitude; but beyond its proper limits he is free, while the owner of the dominant tenement cannot increase the burden. The urban servitudes are (1) support giving the right to rest the dominant tenement against the servient; (2) stillicide, the right to send the water from the roof of the dominant tenement on to the servient property; (3) light or prospect, whereby buildings are prevented from obstructing the light or prospect of the dominant tenement; and (4) *Altius non tollendi*—not to build above a certain height. Probably there is a general resemblance between the law of England and of Scotland on this subject, but one important difference at least exists. In England a servitude of light may be acquired by usage, for, I think, twenty years; but with us such a servitude can never be thus established. In Scotland, if any building is to have a servitude of light and prospect over an adjacent building it must be expressed in the title to both properties. The theory in Scots law is that a proprietor is only bound to provide light and air for his own property, and any open space which he may leave is not to be reckoned on by his neighbour to provide him with light. A common result of this is that a man who has built up to the boundaries of his property some day finds the windows on one side of his property closed up by a building of his neighbours, and the law provides him with no remedy, because in building he ought to have left sufficient open space to supply his house with light and prospect if he wished it. This appears to me to be an important difference between the laws of the two countries, and I must say we seem to take the more equitable view of the matter. With regard to the other classes of servitudes, I know of no other marked difference in our practices, so I need not more particularly refer to them. The questions, then, between conterminous proprietors and between superior and vassal supply the grounds of the legal objections to a petition in the Dean of Guild Court, and I shall now go on to deal with the second class—the practical. Objections of this kind are naturally

mainly taken at the instance of the court itself. A respondent may of course bring under the notice of the court any apparent weakness in construction, and the court, if satisfied that the objection is well founded, will take care that the deficiency is remedied; but for all practical purposes I may say that an absolute discretion in these matters is vested in the Dean of Guild Court, and their judgment will not be called in question. The same remark applies to the powers conferred and the responsibility devolving upon the court by statute, and these may not be filed by the respondents. By this I mean that it is not competent for a respondent to plead that the provisions of the Act are not being complied with, as it is assumed that where these requirements are absolute, the court, as a matter of course, will see that these are given effect to, and where the powers are discretionary, that discretion is intrusted to the Court, and may not be called in question. I shall briefly review these

## STATUTORY POWERS OF THE COURT,

as they may be of interest to you. First, there is the specification of the plans to be lodged, which I have already read to you, and the approval of the material to be used in elevations. Then comes an important section dealing with open spaces in rear of houses, which provides that every new house, and any building altered for the purpose of being used as a house, shall have in the rear thereof or directly attached thereto, and pertaining to and used exclusively in connection with such new house or building altered for the purpose of being used as a house, an open space at least equal to three-fourths of the area to be occupied by the intended house, where such house is not of greater height than four stories; and where such house shall exceed that height, such open space shall be of equal area with that of such house; and such open space shall be free from any erections thereon other than water-closets, coal-houses, or other convenience to be used in connection with such house, all which conveniences shall, as to height, position, and dimensions, be erected subject to the consent and approval of the Dean of Guild Court. Provided always that in any case where the thorough ventilation or light of any house or building is, in the opinion of the Dean of Guild Court, otherwise secured, or under other special circumstances, the said court may, in their discretion, allow the open space to be reduced. Provided also, that in the case of the erection of houses with shops on the ground floor, or of the conversion of a house into a building to be used for business premises only, the Dean of Guild Court may sanction the erection of saloons upon such open space, of such height and construction as to them shall seem proper, such saloons to continue so long only as such building is so used for business purposes; but where any building is to be used for business premises as much open space shall be required as in the discretion of the Dean of Guild Court shall be sufficient for the purposes of light and ventilation, but not exceeding the extent required by this section in the case of a house. Provided further that, from and after the passing of this Act, all existing houses having any open space adjacent thereto shall, as regards such open space, be subject to the foregoing provisions of this section applicable to new houses to the extent to which such open space is available. Provided further, that the provisions of this section with respect to such open space, shall not affect any feuing plans which, prior to the passing of this Act, have been submitted to, and approved by, the magistrates and council, in which a less open space than is in this section prescribed has been so approved. Also, in cases where it is proposed to alter or take down in whole or in part the front wall of a house or building which has in front thereof a sunk or other area or garden plot, and to bring the same or any part forward so as to build or cover over such area or garden plot or any part thereof, the outer line of the front wall shall not extend forward beyond the middle or centre line of the existing wall of such area or garden plot. In every new house, and in every building altered to be used as a house, every habitable room, except attic rooms, shall be in every part thereof not less than 9ft. in height from the floor to the ceiling, and every habitable attic room shall, unless otherwise sanctioned by the Dean of Guild Court, be at least 8ft. in height from the floor to the ceiling throughout not less than one-third of the area of the room, and shall at no part thereof be less

than 4ft. In every new house, or altered building to be used as a house, every habitable room shall have at least one window, and the total area of glass in the windows, clear of the frame and sash, shall be (unless in any case the Dean of Guild Court otherwise determine) at least one-tenth of the area of the room; and the top of at least one of the windows shall not be less than 7ft. 6in. above the floor, and in case of a sash window the upper half at least shall be made to open the full width, and in case of a casement window one-half at least shall be made to open. Then there are provisions as to buildings causing

## EXTRA RISK OF FIRE,

chimney stalks for furnaces, buildings for noxious trades, the height of rooms in dwelling-houses, and the ventilation of inclosed spaces—that is, where a person proposes to erect a block of buildings inclosing a space containing an area of less than 2,000 superficial yards, and being less than 40yds. wide at the narrowest part. Finally, there is the general power to decline to grant any warrant until the court is satisfied that the plans provide suitably for strength of materials, stability, mode of access, light, ventilation, and other sanitary requirements, and are otherwise in conformity with the provisions of the Edinburgh Municipal and Police Acts.

(To be concluded.)

## FISHMONGERS' HALL.

IN the course of last year the Court of the Fishmongers' Company decided to redecorate their great hall, with the entrance and main staircase leading to it. Mr. Crace was invited to assist the Company's surveyor, Mr. H. Chatfield Clarke, in reporting upon the treatment desirable; and their joint report was adopted by the Court. The works decided upon were carried out during the autumn, and completed before Christmas. The previously existing decorations were executed thirty years ago under the direction of Mr. Owen Jones, and some of the work then done remains in the reception-rooms adjoining the hall.

The building itself was erected in 1831, from the designs of Mr. H. Roberts, and is in the rather cold "Greek" character affected at that time. The late Sir Gilbert Scott, who was articulated to Mr. Roberts, took some part in supervising the erection. It was an instruction of the Court to Mr. Chatfield Clarke and Mr. Crace that the architectural detail and character should in nowise be disturbed. This has been strictly adhered to; but a much warmer and more "hospitable" result than before has been attained.

The square entrance-hall, which has a flat coffered ceiling divided by flat beams, and walls divided by pilasters, has the wall spaces of a lively Pompeian red, the pilasters, frieze, and cornice being of a vellum tint, relieved in the frieze by a moderate amount of ornament executed in dull yellow and chocolate brown.

The pavement here, as also in the adjoining staircase corridor, is of marble mosaic, laid out on a simple geometric scheme in mixed shades of white with bands of black, light red, grey, and yellow. The corridor in question, and the lower story of the grand staircase, to which it is open on one side, have also red as the ground colour of the walls; at the top a frieze is painted in light ornament upon the red ground, interrupted at intervals by panels or medallions with dark grounds. Below, a dado of simple Pompeian character is worked on a darker tone of red.

The large piers at intervals are in light colour, with bronze and gold enrichments, and the ceiling is vellum white with grey-blue panels, and some relief of bronze and gold in the mouldings. The doors and other woodwork here and throughout are of oak, once French polished, but now bared of polish, brought to a natural surface of quiet tone, and wax-rubbed, the mouldings being gilt.

In the Grand Staircase the red is continued up to the gilt string-course on the first-floor level, the niche in which Walworth's statue is placed being gilt, as also are the metal balustrades throughout. Above this level the walls are panelled, as well as being broken by scagliola pilasters and columns, by doorways, and by the large triple window. In the panels are full-length portraits, the panels and margins being in two low tones of green, divided by mouldings in gold and vellum. The ceiling here is also coffered in square panels, now in quiet light blue with gilt centre flowers, and the enrichments of

the cross-beams, mouldings, &c., as also of the cornice and architrave, are mainly in bronze and gold. There is a rich maroon ground in the frieze, intended for an inscription. The triple window of three equal lights (originally filled with ground glass and coloured margins), is now glazed with leaded glass, of which the design is expressive of the sea fisheries, the general ground being white, ornamented with sea plants, fish, and festoons of nets, while the borders are formed entirely of seaweeds and "crustaceans," all carefully drawn from nature. In the centre of the middle light are the company's arms and supporters, while on either side are the arms of the former companies of stock-fishmongers and salt-fishmongers, which were united in the existing company in 1535.

The Great Hall, with five windows on the east front, has its ceiling, which rises on a low elliptic section, also divided into rectangular panels with bold flowers in the centre. These are divided into groups by bold bands of Greek guilloche ornaments, which have been solidly gilt with good effect, as have the centre flowers, the panels being light blue, and the mass of the ceiling margins and framework in broken white. The deep cornice and frieze are in light tones, with the enrichments boldly gilt, and a dull red background to the scroll of the frieze. The scagliola pilasters remain, and the walls are painted in low-toned green as a ground for the pictures, whilst between the bronze and gold capitals of the pilasters and close under the frieze are ranged the interesting series of old carved and gilt shields which commemorate the arms of the Prime Wardens from early in the 17th century. The woodwork here, as elsewhere, is of wainscot, now freed from polish and with the mouldings gilt, and a dado of similar wainscot panelling has now been added to connect the rest. A good effect is obtained by making the walls of the music gallery of a dull red.

The hall has now been lighted with electric light, partly from four points in the ceiling, where groups of lights are inclosed by pendant cut-glass drops, and partly by lights concealed by the cornice on two sides of the hall.

#### THE CAUSES AND RELATIONS OF GOTHIC ART.

AT the Municipal School of Art, Manchester, on Friday evening, Mr. W. R. Lethaby delivered a lecture on "Gothic Art as Set Forth at Chartres Cathedral," illustrated with lantern views. Mr. Charles Rowley presided.

Mr. Lethaby explained that his purpose was to endeavour to suggest to his audience what Gothic art was in its deeper causes and its wider relations. The pictures he had to show were intended to awaken an interest in the works themselves and the age which produced them. "I want you," he said, "to realise that we have scattered over England not only great numbers of cathedrals and abbeys, but thousands of parish churches, each one of which (so far as it has been spared from the falsifying process called restoration) is an authentic piece of the life-work of the fore-dwellers in the land." The origin and growth of the Gothic art were next dealt with. The fundamental fact, said he, of the relation of Christianity to art in Europe in the Middle Age was this—that the world and the Church at that time became co-extensive, or, in more general language, activity was controlled by idealism. Earlier, and in the East, idealism had tendency to repudiate activity. In modern days activity seemed to have repudiated idealism. In other words, then, these were the days of what we called science, and science disclaimed any selection. Power and the plunder of the earth were the great facts. Few asked what for; but the time would doubtless come when a new ideal would make this gathered knowledge again reasonable. Art was defined by the lecturer as idealism manifested in man's daily work. "It is a soul put into matter, and, so to say, the religion of hand labour." Under such influences the whole of Western Europe became one great work of art. In a great free town a cathedral was much more than a bishop's church. A cathedral of a free city like London was its great heart, considered as a structure; it was its soul, considered as an idea. In all aspects it was built by the citizens for the use of the people and to make the city holy. Such a cathedral was no curious compound of sacred edifice and sixpenny show. But, built by the side of the marketplace, its great doors stood wide open to the

people from dawn till late at night. As to these marvellous buildings his heart failed him, like the Queen of Sheba's; the half of their glories and wonders could not be told; they were more than buildings, more than art; something was built into them with the stones and burnt into their glass more than any of us would ever understand. The work of a man a man might understand, but these were the works of ages, of nations; all a consistent development, stone balanced on stone, vault springing from vault, tracery interlacing and sustaining brilliantly-dyed glass as branches held sun-saturated foliage in a beech avenue. Towers stood firm as cliffs, spires were flung into the air like fountains. The cathedral was, in short, a great outward manifestation of men working in free association under the impulse of a noble idea. Coming to speak particularly of Chartres Cathedral, which he described as "one of the most famous of the cathedral churches of France," Mr. Lethaby gave a glowing picture of its beauty, some lantern sketches helping to give the audience a vivid idea of the wondrous "poem in stone," an edifice more wonderful, in Mr. Lethaby's view, than "any imagined palace of Aladdin."

#### THE TESTING OF MATERIALS OF CONSTRUCTION.\*

A SECOND edition of the invaluable work of Professor W. Cawthorne Unwin, F.R.S., embodying the latest investigations and results of the testing of materials, will be gladly received. Although there are numerous treatises on the strain and stress of materials used in construction, very few deal with the methods by which the data are determined, and yet such information is of considerable importance in accepting such data. The methods of testing are now more important to the engineer and architect if they are to select the most suitable materials for their purpose. Professor Unwin's is the only complete English work that deals with the methods and apparatus used in testing. The present treatise deals (1) with the mechanical properties of materials; (2) with the apparatus used in the engineering laboratory, than which no one probably has had greater opportunity of examining and using; (3) and with the most trustworthy results of testing of all ordinary materials. All the facts observed about a material are recorded, and the tables given are a valuable collection of reliable results, and have been reduced to common units. The author says truly, "Little information is derivable from tests of completed structures," owing to the necessary limitation of the testing load. Only the ordinary working load can be applied. The more useful tests are those on specimens of the materials submitted to straining actions. Professor Unwin distinguishes two kinds of tests—one scientific and the other commercial. The first deals with the physical constants of the material and theory of stress; the second deals with samples of a material, and whether it complies with arbitrarily chosen standards. The "properties of bodies under stress" are thoroughly discussed in the first chapter. Tension and compression, shearing-stress, bending-stress, deflection of beams are mathematically explained; the plasticity and hardness of materials embracing in these terms malleable, ductile, plastic properties. Thus iron at welding heat takes every figure given to it in the rolls or under the hammer and retains it; it is almost perfectly plastic, and M. Henri Tresca's scientific experiments on the plastic properties of solids are referred to. "Stress-strain diagrams" for different materials are considered, with the help of curves. It is shown that curves giving the relation of stress and strain during plastic deformation are parts of hyperbolas.

The chapter on testing machines is of practical interest. Those who are about to equip laboratories and institutions devoted to engineering and technical science will derive much valuable advice from these remarks. As Professor Unwin says, "With every increase of complexity in the machine, and with every addition to the accessory apparatus, greater difficulty in using the machine, more care in adjustment, and more loss of time in adapting it to particular experiments is involved. Hence, the extent to which it is desirable to combine different functions in a single

\* The Testing of Materials of Construction. A Text-book for the Engineering Laboratory, &c. By WILLIAM CAWTHORNE UNWIN, F.R.S., M.Inst.C.E., &c. London: Longmans, Green, and Co.

machine is a matter for careful consideration in any given case." The instructions and descriptions are given of the principal types of testing machines, the Woolwich Dockyard 100-ton machine, the Werder machine, vertical testing machine of Messrs. Buckton and Co. (shown in photographic frontispiece at the Central Technical College), compound lever machinery, the Olson 100-ton machine, the Watertown 450-ton testing machine, &c. The chapters on measuring instruments—as those used by the author; Professor Kennedy's extensometer, a simple lever arrangement; Unwin's mirror extensometer, Professor Ewing's instrument and autographic recording apparatus, the procedure in testing, and the experiments on timber, stone, and bricks, limes, and cements are of much value to all engineers and students. The book is well printed, and full of diagrams and data derived largely from original research.

#### A FIRE-TESTING STATION.

THE British Fire Prevention Committee, founded by Mr. Edwin O. Sachs after the Cripplegate fire, has established on the banks of the Regent's Canal, near St. John's Wood-road Station, a unique fire-testing station. Its object is to test various materials and systems of construction used in building practice, so as to obtain trustworthy information respecting the resistance they offer to fire. What information of this sort is at present available is, with few exceptions, the result of inquiries carried on by makers or inventors, and therefore cannot claim the authority attaching to independent investigations. At this station the tests are to be made by independent experts, who in their reports will state nothing but the bare facts, anything like expressions of opinion or criticisms being rigorously excluded. Moreover, anyone who submits an article or device to be tested must bind himself not to publish, or allow to be published, any account of the results except the duly authenticated official report of the committee without abbreviation. With these precautions to obtain simple facts free from bias of any kind, the tests applied are to be arranged on scientific lines, though with due regard to the practical purposes in view, and to be taken with such instruments as to secure trustworthy data. They are to be under the superintendence of the members of the council of the committee, and their general arrangement is to be settled by the executive in accordance with definite principles laid down after careful study and experiment. For "full-size" tests, brick huts in the garden of the institution will be used. In these, temperatures up to 2,500° can be realised by means of a water-gas installation, readings being taken by automatic electrical pyrometers and pictures of the condition of things inside the huts by photography. The expenses of establishing the station have been met by a special subscription, by which also the costs of conducting tests of general technical interest will be defrayed. Inventors or manufacturers must, however, pay for the tests they require, though the charges are so calculated as only to cover the actual cost of the investigation.

#### IRON CONSTRUCTION IN DRAINAGE WORK.—VII.\*

By T. E. COLEMAN, F.S.I.

WHERE a water-closet is connected to an external iron soil-pipe by means of a lead branch, the yielding nature of the lead permits any slight settlement taking place without affecting the soundness of the joint. But when a fitting is directly connected to the rigid arm of an iron soil-pipe branch, any settlement or disturbance from careless usage might break the stiff cement joint between the iron and earthenware. For this reason the provision of a short lead branch is considered preferable.

To prevent siphonage of the water seal in the closet-trap, a 2in. diameter lead anti-siphonage pipe is taken from the lead branch at a point near the crown of each trap. In the case of a single closet, the anti-siphonage pipe is then carried through the wall and connected directly to the soil-pipe.

When two or more closets are arranged on different floors, and discharge into the same soil-pipe (as illustrated in Fig. 91), an anti-siphonage branch from each closet is taken to the main

\* All rights reserved.

anti-siphonage pipe outside. The upper end of this pipe is then connected by means of a brass ferrule to an "inverted branch" of the iron soil and ventilating pipe placed well above the level of the highest closet.

The soil-pipe must be continued full bore above the eaves of the house, so that it may act as a ventilating or vitiated-air extracting pipe. In some instances an exhaust ventilating cowl is provided; but generally the open end of the ventilating pipe is simply finished with a hemispherical copper wire grating.

Wrought-iron welded spigot-and-socket pipes may sometimes be advantageously adopted for long straight lengths of ventilating shafts, &c. The number of joints required only amounts to about one-half that of cast-iron pipes of the same diameter, whilst they are considerably stronger than cast-iron pipes having the same thickness of metal. Fig. 101 is a section through Spencer's patent wrought iron spigot-and-socket pipes.

Fig. 101.

They are manufactured in lengths up to 16ft., and are capable of withstanding a pressure of 1,000ft. head of water. The average weights and thickness of pipes of different diameter are as follows, viz.—

WROUGHT-IRON SPIGOT-AND-SOCKET PIPES.

Diameter.	Thickness.	Approximate weight per yd. run.
Inches.	Inches.	Pounds.
2	$\frac{3}{16}$	14
2½	$\frac{3}{16}$	17
3	$\frac{3}{16}$	20
3½	$\frac{3}{16}$	24
4	$\frac{3}{16}$	27
5	$\frac{3}{16}$	33
6	$\frac{3}{16}$	39

The joints are run with lead, and caulked in the usual way. Any slight bends or curves may be formed in the pipes themselves if required; but any junctions or other irregular forms must be made of cast iron. The pipes may be galvanized, coated with Angus Smith's solution, or enamelled inside.

In the United States, steel or wrought-iron lap-welded pipes, put together with screwed joints, are very extensively used for soil, waste, and ventilating pipes. The drains and branches are also constructed of similar pipes, when they are not buried in the ground, but exposed to view throughout, as in the basements of buildings. The junctions, bends, traps, &c., are made of heavy cast iron with properly screwed sockets to receive the wrought-iron pipes. It is found that for the construction of the tall buildings so largely affected in America, the use of wrought-iron tubing in drainage work possesses certain advantages over cast iron. As the former may be obtained in lengths of about 20ft., the number of joints required is proportionately less. The long lines of wrought-iron pipe are also more elastic, and adapt themselves to any slight settlement or disturbance without cracking, whilst the pipes may at any time be taken down, and a necessary alteration or addition expeditiously completed.

Many sanitary engineers in this country use lead soil, waste, and ventilating pipes in preference to cast iron. The former metal is practically unaffected by exposure to air, and does not deteriorate by oxidation or "rusting," whilst a thoroughly reliable solder joint can readily be obtained between the several pipes or branches. Drawn lead pipes have a smooth interior, and are obtainable in 10ft. lengths instead of 6ft., as for cast-iron soil-pipes, so that fewer joints are required. Lead pipes also lend themselves to easy manipulation by the skilled plumber, so that any alterations or cuttings required for bends, junctions, connections, &c., can be easily carried out on the spot, whereas with such an intractable metal as cast-iron it is not practicable to make similar modifications if required.

On the other hand, owing to the readiness with which lead expands and contracts when subject to differences of temperature, there is a great tendency for long soil and waste-pipes of this metal to gradually "creep" down towards the

base of the building, unless they are well supported at frequent intervals. In the case of waste-pipes having hot water poured through them, it is not advisable to use lead pipes, as the

Fig. 102.

continual expansion and contraction soon causes them to crack.

Lead soil and waste-pipes should be of the description known as "hydraulic drawn," in 10ft. lengths, and having a thickness of metal corresponding to a weight of at least 7lb. per foot super. Generally the pipes are specified to be of 8lb. thickness, whilst in some instances heavy lead soil-pipes of 10lb. thickness are used.

The weights for lead soil and waste-pipes of various sizes and strengths are as follows, viz. :—

DRAWN LEAD SOIL AND WASTE PIPES.

Weight per 10ft. Length.			
Internal Diameter.	7lb. Thickness.	8lb. Thickness.	10lb. Thickness.
2½in.	48lb.	55lb.	—
3	57	66	—
3½	67	76	97lb.
4	76	87	110
4½	85	97	122
5	94	107	136
6	112	128	164

The minimum weights for lead soil-pipes (per 10ft. length) permitted under the by-laws of the London County Council are as follows—viz. :

MINIMUM WEIGHT FOR LEAD SOIL-PIPES.

Diameter.	Weight per 10ft. Length.
3½ inches .....	65lb.
4 " .....	74lb.
5 " .....	92lb.
6 " .....	110lb.

These weights are equivalent to a thickness of lead weighing about 7lb. per foot superficial.

The joints on lead soil and waste-pipes should be made with a "wiped" solder joint, as shown in Fig. 102. After the ends of the pipes have been slightly enlarged by means of a wooden cone or "turn-pin," they are neatly and

Fig. 103.

accurately filed to the shape indicated by the dotted lines in the sketch, so that when brought together absolute contact is insured at the joint, and any risk of molten solder entering the interior of the pipes avoided. To prevent the solder adhering to the pipe, except at the joint, the adjacent surfaces A A are painted with "soil" or "smudge" (composed of lampblack

and size). When the smudge is dry, each end is scraped with a shave-hook in order to expose a clean untarnished surface for the proper adherence of the solder to the lead. Immediately the scraping is completed the surfaces are smeared with tallow to prevent oxidation from exposure to the air. Molten plumber's solder (composed of two parts lead and one part tin) is then poured on the joint, the superfluous metal being carefully wiped off with a cloth.

The length of a wiped solder joint varies with

Fig. 104.

the diameter of the pipe, and also according to the individual predilection of the workman making it. Well-made wiped joints should be about 2½in. long for pipes ½in. to ¾in. diameter; 3in. long for 1in. to 2in. pipes; 3½in. for 3in. to 4in. pipes; and 4in. long for 5in. and 6in. pipes. The quantity of solder required for each joint averages about 1½lb. for every inch in diameter of the pipes to be joined. Thus a 4in. soil-pipe requires about 5lb. of solder for every wiped joint.

The pipes must be thoroughly well supported by means of strong cast-lead "tacks" soldered thereto. Fig. 103 is a sketch of what is known as a "single tack" ready for soldering to the soil-pipe, whilst Fig. 104 shows a "double tack." They vary from 4in. to 9in. long, and may be

Fig. 105.

obtained in numerous ornamental patterns for pipes up to 6in. in diameter. They are secured at the back of the pipes with a strong solder joint, as indicated in Fig. 105. To prevent "creeping," the tacks should be spaced about 3ft. apart, or, say, three tacks to every 10ft. length of pipe.

#### THE FAWCETT FIREPROOF FLOOR.

FIRE-RESISTING floor construction has made very rapid development during the last few years, and by the law of survival of the fittest, two or three systems among many have become generally accepted as embodying the main principles of a sound system. The floor ought to be impenetrable to the passage of air or fire upwards; the iron or steel beams should be protected from the action of fire, so as to prevent them buckling or distorting the walls, and this protection ought to insure a complete insulation of the lower flange. Experience has proved that this is best done by interposing between the lower flange and the terracotta a space through which the air may circulate. The Fawcett ventilated fireproof floor fulfils these conditions in a manner that leaves little to be desired. In this construction, a fire may heat the terracotta casing to a white heat, but the air space between it and the lower flange of beam forms a layer of air which circulates the more it is heated, thus forming a cooling non-conducting medium. Many of our readers are acquainted with the Fawcett floor, which may be described briefly as consisting of steel I-beams placed about 2ft. apart, between which, resting on the lower flanges, tubular terracotta semicircular lintels are obliquely placed, the lower flat-plate of each encasing the beam flange, allowing an air-passage under each beam transversely through the lintels.

These are connected with an air-brick flue in outer walls. The cinder concrete filling bears on the bottom flanges, and occupies the whole depth of floor. The lower plate of lintels is dovetail-grooved as a "key" to the plaster, while the flooring-boards or blocks are fixed to dovetail-shaped pieces, which run along on the top of each beam, making a solid and impervious floor. The tubular lintels, each about 7 in. wide, are grooved on the outer side to form a better "key" to the concrete, and are 3 in. thick, and are the outcome of study and experience in their proportions and make. These floors have been extensively used, not only in the United States, but also in this country in numerous Government buildings, including the new Record Offices, the new Admiralty block. In the latter building, the patentees have adopted it on the sloping roofs, for which it is well adapted, and forms an external buttressing as well as a roof. We have also seen its other applications to buildings in London. Several important office buildings, residences, and apartment-houses in Philadelphia, New York, Boston, and Pittsburg, have been constructed upon the system, a list of which is before us. Of these, we may mention Bank of North America, the Halle Building, designed by Mr. Willis G. Hall, the Gerard Building, several insurance offices, storage warehouses, public schools. The St. James Office Building, Broadway, New York, by Mr. Bruce Grice, architect, shows a very important application of the Fawcett ventilated fireproof system to a tall building 16 stories high, the whole steel skeleton construction of which was erected on the system before the outer skin of masonry was built. The Fawcett floor really combines all the chief merits of the fireproof system: it is easily applied to existing as well as to new buildings, and it is capable of carrying a load of 1,500 lb. per square foot. The names of the architects who have used it are a high guarantee of the merits of the system, as applied, not only in this country, but in the United States.

Mark Fawcett and Co. have introduced an improved wood-block floor, suitable not only for their own but other systems, the special feature of which is that the blocks, arranged herring-bone-wise, are connected together by steel tongues, which run through the corners of each block in a manner which affords perfect rigidity and elasticity. We saw, the other day, sample pieces of this floor, made of maple wood, and we have no hesitation in saying it is constructed on a very scientific principle of connection. Blocks about 9 in. by 3 in. and 1 1/2 in. thick, placed at right angles to each other, herring-bone fashion, have saw-cuts made on two opposite angles of each, and through these steel tongues, about 1 in. wide, are run, giving great strength and rigidity to the flooring at their weakest points. The effect of these continuous tongues is to connect together a large square of the flooring. Floors on this principle have already been laid by Mark Fawcett and Co., at Her Majesty's Mint, the Natural History Museum, Eastern Post Office, and the company are about laying down a floor to the Buckingham Palace additions. Polished maple, pitch-pine, or other wood blocks, with steel-tongued joints, make very effective parquet borders, dados, and wall-linings, and this mode of connecting the blocks deserve the attention of all architects.

#### MEMORIAL HOSPITAL AT BULAWAYO.

THE extension of the front of the memorial hospital has reached such an advanced stage that the outside was practically completed when the mail left.

"A walk through the interior of the new portion (says a correspondent) leaves one with an impression of bright, airy, and well-ventilated rooms—all the qualities which conduce in a most marked manner to the well-being of patients. The corridors, and most of the rooms (a few of the latter are concreted) are floored and ceiled with 4 in. boarding, and all the rooms are ventilated by Boyle's patent ventilating air-pumps.

"Along the whole of the front under the roof and above the ceiling, a main ventilating-shaft will run, on the top of which, on the roof, six of the patent air-pumps are to be placed—three on the old and three on the new fronts respectively. From those rooms that are not directly ventilated by the main shaft, a connecting shaft will be run to the former. Another special feature introduced by Messrs. Benzie and Deeble in the ventilation line is the provision of an opening, 2 in.

wide, all round the building between the roof and the brickwork, the opening being protected from the weather by eaves, which project 1 ft.

"The general ward is a very fine room, 83 ft. long, 24 ft. wide, 14 ft. to the ceiling, and another 13 ft. to the pitch of the roof, splendidly lighted and ventilated, and affording 1,500 c. ft. of air-space to each patient, the intended number of the latter being 20 (the cubical capacity per patient being that recommended by the best authorities). The ward seems in every way an ideal one, and would appear to justify the architect's encomium thereon—that it equals any to be found in any of the best hospitals at home."—*South Africa.*

#### THE SURVEYORS' INSTITUTION.

THE discussion on Mr. Weaver's paper on "The London Building Act and the Official Supervision of Buildings" was resumed by Mr. E. W. Hudson, who said that it seemed to him the question was whether any change of the kind proposed—the uniting of the offices of district and parish surveyor—was necessary, who asked for the change, and who would be benefited by it? It was said that some change was inevitable, and Mr. Wheeler somewhat oracularly predicted its near approach; but there were, on the other hand, indications that it was by no means a foregone conclusion. It could not be expected that the County Council would willingly relegate any of its powers to the local authorities, although that body was always ready to take up new duties and responsibilities. There was, no doubt, a distinct tendency toward some measure for adding to the dignity of the vestries; but he agreed with Dr. Longstaff's view that if the change were made compulsory, it would not be successful. It had been said that all work in connection with a district surveyor's duties should be vested in a local authority. But why? The public was content, so long as its sewers and roads were attended to, to consider the local surveyor responsible, and the builders and architects, who were the persons most directly interested, seemed satisfied to let the *status quo* remain. The speculating builder would, of course, welcome the removal of the burden of fees from his own back to that of the ratepayer; but it would be difficult to persuade that long-suffering individual that he should pay the fees which naturally fell upon the profit-maker.

Mr. William Eve, speaking as one who had to submit to the decisions of no less than five different district surveyors, as a vestryman of 28 years' standing, as a member of a works committee for the last 18 years, and as one of the delegates to the London County Council on the subject, claimed to have some knowledge of the matter under discussion. He was willing to admit the capability of the district surveyors of London, and he thought it desirable, from his own experience, that a single rather than a dual authority should have control over all public works. Of course, if vested interests were interfered with they must be compensated. It was said that outside the Metropolis the existing system involved delay; but he saw no reason why legislation should not avoid that by fixing a time limit for the approval or rejection of plans. His lengthened experience taught him that there did not exist the corruption and favoritism which some speakers had attributed to vestries. He did not say the respective duties were not now satisfactorily discharged; but he thought the system under which one surveyor fixed the position, for instance, of the w.c.'s, and another determined the thickness of the walls of those same w.c.'s, was anomalous and cumbersome.

Major L. H. Isaacs said it would be mere affectation on his part to say that he was unqualified to speak on the subject of Mr. Weaver's paper, for his experience of the duties of a local surveyor's practice extended from the time of his first pupillage until the present date, and after carefully considering the suggestions contained in the paper, he must say that he agreed with Mr. Weaver that the present dual system was unsatisfactory. As Mr. Weaver had shown, the laying out of roads, for instance, was controlled by one authority and the sewerage of the same roads by another. The road plans left with the County Council were referred to the local authority, and the sewer plans deposited with the local authority were referred to the County Council, both cases involving power to object, and causing unnecessary waste of time, which in

building operations meant waste of money. He quite agreed that the present system, by which the surveyor was paid by the people over whom he had to exercise vigilance, was an anomalous one, and he could only compare it with the payment by a shipowner of the fees of a Custom House officer, who was appointed by law to prevent any smuggling on his ship. The surveyor had definite duties to perform in seeing that the law was not infringed, and he ought to be independently paid for his services. If, as Mr. Freeman had been quoted as saying, a district surveyor was merely appointed under Act of Parliament, and was responsible to no one, he thought the time had come when such an anomalous state of things should cease to exist.

Mr. A. W. Tanner said the subject has, he thought, been approached from two sides, the sentimental and the practical, but it ought to be possible to provide some bridge between these two. There was a decided feeling that some change in the present anomalous dual control of district and local surveyors was needed. Mr. Weaver had said that the district surveyor had no champion. But where could he expect to find one? Would the builder, who was his natural enemy, champion him? Would the vestries back him? Would the public, who did not understand him, or the Press, which was, as a rule, ignorant of his position and duties, advocate his cause? He was created by Parliament, and in Parliament lay his only chance of help. By all means let London be divided into separate municipalities, so long as each was large enough to maintain an efficient engineer, an architect, a medical officer, and a surveyor, each with an efficient staff. There was a strong feeling in favour of some change, and the question was how best to effect it.

Mr. A. A. Hudson said he presumed the object of the paper was the transference to the local authorities of the duties which were now performed by district surveyors for the benefit of the public; but the word "public" must not be construed to mean only those who were about to build or were interested in buildings: what must be considered was the interests of London as a whole. District surveyors performed many duties which could not well be carried out by anyone else, though no doubt some of their work could well be relegated to the local authority. It was one of his pet schemes to see established some system of technical tribunals who would deal with all these questions with elasticity and skill.

Mr. F. Wallen thought it would be an excellent plan to revert to the former custom of placing the entire supervision of the works in a house under the control of the district surveyor.

Mr. Weaver, in reply, confessed to being a little surprised and pained that an expression in his paper had been misunderstood. When he said that the office of district surveyor was sought for the sake of the private practice it might bring, he only meant that there were many persons who, having no preference for any particular architect, would employ the district surveyor both because his position was a guarantee of his skill and integrity, and because he was likely to be more conversant than another with the regulations of the Building Acts. He did not propose in his paper to transfer the duties of the district surveyors to the parish surveyors, many of whom would be hardly qualified to carry them out; but he proposed to amalgamate the two offices in one, and thus abolish the present anomalous dual supervision. It appeared to him unreasonable to appoint an architect to the position of district surveyor on account of his architectural skill, the non-user of which was a condition of his appointment. It was, he held, most essential that the official, whatever he might be called, should have an intimate knowledge of all the circumstances of the district, such as water supply. He did not assume any negligence on the part of a district surveyor in the case of dangerous structures; he only said that, as a rule, his duty only commenced when his attention was called to them. He thought it would be well to invest the existing tribunal of appeal with power to determine all questions under the Building Act.

Works of water supply have just been carried out at Mundesley, Norfolk, for the rural district council of Erpingham. The engineer was Mr. Stephen H. Terry, Messrs. Merryweather and Sons (Limited) took the contract for the well, and Messrs. Willmot Brothers are supplying the engine and pumps.

## SANITARY FITTINGS AND PLUMBERS' WORK.

A VERY comprehensive and excellently printed and illustrated catalogue of sanitary and general goods has just been issued by the well-known firm of Nicholls and Clarke, lead and glass merchants, of Shoreditch. The Sanitary department of this firm is a very large one, and a glance through the sectional index shows the wide range of goods supplied for the plumber and sanitary engineer. The catalogue is more than a mere price-list: it is a compendious book of reference for the architect's office and builder's workshop. Under the head of Closets we have well-illustrated descriptions of every leading kind of valve and wash-down, pedestal, wash-out, &c., from which it ought not to be difficult to select a suitable closet for every purpose, from the mansion to the cottage. Nicholls and Clarke's "Special" valve-closet, with "fawn-coloured" basin, flush rim, copper regulators, or "regulating valve," is remarkable for make and price. No. 11 is of best quality, and ranges in price from £4 7s. 6d. to £5 5s. Nicholls and Clarke's best quality (Underhay's system) has a high repute. Other varieties, by well-known makers, comprise Hellyer's patent "Optimus" valve; Jennings's patent valve-closet and trap in one piece, and "Trapless" and several improved wash-down pedestal closets, such as the "Deluge," Doulton's "Simplicitas," "Hygienic" (Hellyer's), &c. Automatic flush-tanks, Nicholls and Clarke's "Era" siphon waste preventer, approved by the London School Board, the "Monarch" preventer, and others are illustrated. The sinks, of stoneware, glazed fireclay, earthenware, enamelled cast iron, steel, kitchen and slop-sinks leave nothing to be desired, some fitted with hot and cold valves and brass-hinged grating. The pages illustrating traps of various kinds are valuable for reference by architects and others, and comprise all the leading types of traps, like Hellyer's anti-D-traps and stoneware interceptors. The "Improved Kenon" disconnecting trap and channels for man-holes and manhole covers show improved makes. The section on Lavatories is most complete, embracing every class of arrangement, angle and oblong, and all kinds of fitting and finish, ranging in price from the simple bracket lavatory to the ornamental cast-iron and cabinet arrangements. Baths also are numerous illustrated, and include every design and description of bath. The "Combination" cast-iron baths which require no casing marbled outside and enamelled in; the patent "La Marguerite" cast-iron bath, and several kinds of capital portable baths of sheet-iron are shown. Pumps and fittings, cisterns, boilers, gas-fittings, and plumbers' brasswork and fittings are included, and the by-laws and waterworks regulations make a very valuable book of reference for the architect and sanitary engineer. In addition, we find descriptions and prices of plate and ornamental glass and iron casements. We can highly recommend Nicholls and Clarke's handsomely got up catalogue to the building trade and profession.

The county council of Staffordshire have instructed Mr. H. T. Hare, of London, the architect of the recently-completed council buildings at Stafford, to prepare plans for the extension of the technical institution schools on a site in St. Martin's-place recently acquired for that purpose.

At the first annual meeting of the Association of Civil Engineers, Architects, and Surveyors of Newport, Mon., Mr. W. Hitchcox, F.S.I. (Graham, Son, and Hitchcox), was elected president, and Mr. W. S. Smyth (Alexandra Docks and Railway Company) vice-president.

On Wednesday week a party of the City of London College Science Society, under the guidance of the new president, Professor Henry Adams, M.Inst.C.E., M.S.A., visited the locomotive works of the North London Railway at Bow. The works extend for a mile from the Bow-rod to the Lee Cut, and find employment for a staff of 800 men. A vote of thanks was proposed to the locomotive superintendent, Mr. H. J. Pryce, for permitting the visit, and to Mr. E. J. C. Manico and his assistants for their guidance and explanations.

At Greenwich Police-court, on Monday, Allen Harvey, of the Pavement, Crofton Park, Brockley, was summoned by the Greenwich District Board of Works for permitting two houses in Horsted-road, Brockley, to be occupied as dwelling-houses, without having obtained certificates from the Greenwich Board of Works of a proper and sufficient water supply. Mr. Kennedy fined the defendant £5 and 2s. costs in each of the two cases.

## OBITUARY.

By the death of Mr. THOMAS CHAMBERS HINE, F.S.A., which took place at his residence in Regent-street, Nottingham, on Monday night, at the ripe age of four score years and five, one of the last of the old Revived Gothic school of architects has passed away. The late Mr. Hine, the son of Benjamin Hine, a hosiery manufacturer of Nottingham, and a member of an old Dorsetshire family, was born in 1813, and was articled to Mr. Habershon, a local architect, who was in partnership with Mr. Patterson, a builder. In those days it was a common occurrence for architects and builders to be associated as partners. When Mr. Hine attained his majority (Mr. Habershon having retired), Mr. Patterson took him into partnership. They were in business together for about fifteen years, doing a great deal of work in the city and county and the neighbouring counties. During this time he built the imposing house in which he died. In 1849, on the dissolution of partnership, he commenced practising on his own account, his offices being in his residence. The first work with which he was connected after the partnership came to an end was the Bentinck memorial in Mansfield Market-place, erected to the memory of the late Lord Geo. Bentinck. He erected and restored numerous churches and vicarages, and in Nottingham, in the early days of the lace trade, he built most of the principal warehouses and factories in the Lace Market. In 1857 Mr. Hine took into partnership Mr. Robert Evans, who had been a pupil and afterwards an assistant in his office, and they were associated in the new relation for ten years. Early in 1854 Mr. Hine was appointed surveyor to the Newcastle estates by the fifth Duke the "statesman Duke," and the architect subsequently laid out the Nottingham Park estate, both designing and erecting most of the houses upon it. Seven years after his appointment the Duke of Newcastle spent the sum of £4,000, realised by the sale of the timber blown down in Clumber Park by a great gale, in the erection of a church from Mr. Hine's designs at Shireoaks for the use of his colliers in that village. In 1864, on the death of his Grace, the management of the estates was vested in the late Mr. W. E. Gladstone and Lord De Tabley, the great statesman frequently visiting Nottingham in connection with their superintendence. He never came to Nottingham without visiting Mr. Hine. When the new Duke—the sixth—succeeded to the title he desired to erect a chapel near Clumber House, and he commissioned Mr. Hine to design it. Before the building was finally completed the Duke was in pecuniary difficulties, and was adjudicated a bankrupt, and, in consequence, the chapel was left in an unfinished condition until the present Duke came of age eight years afterwards. His Grace then pulled down the chapel to make room for a magnificent church, over which he spent £60,000. In 1867, the term of the partnership with Mr. Evans having expired, that gentleman left the business, and Mr. Hine took in his place his eldest son, Mr. George Thomas Hine, and they continued a large practice until the year 1890, when Mr. Hine, sen., retired altogether, and the son went to London, and he has since been widely known as a specialist in designing asylums and similar institutions. In 1876 Mr. T. C. Hine suggested to the corporation of Nottingham the idea of leasing the castle from the Duke of Newcastle's trustees and converting it into a museum of arts. By a special Act of Parliament the Castle, which was then in ruins, as left after the Reform riots of 1831, was leased from the Duke's trustees for a term of 500 years. The museum, the work of restoration being designed by Mr. Hine, was opened by the Prince of Wales. Perhaps the greatest work with which Mr. Hine's name is associated as architect is the Great Northern Railway Station in Nottingham. Mr. Hine may be regarded as a leader of the Revived Gothic architecture in the Midland Counties; but, of late years, in his domestic work, he adopted a style bordering on the Renaissance. He was keenly interested in antiquarian and archaeological research. He never associated himself with the Institute of British Architects, but he founded the local architectural society, and he did all he could to advance the profession. Of late years, since his retirement from active work, he amused himself with drawing and water-colour painting, and he has left a large collection. In his younger days he was a most indefatigable worker. Until he reached the age of 70 he was generally at work from nine

o'clock in the morning till six at night, and after dinner and a short rest—at ten o'clock—he would recommence and work on till one or two o'clock in the morning. Mr. Hine, who had been a widower since 1853, leaves three sons and four daughters.

THE death is announced at the age of 66 of Mr. JOHN CHARLES DUNLOP, J.P., one of the most energetic members of the corporation of Edinburgh. Mr. Dunlop, who died on Saturday, was engaged for many hours of the previous day as convener of the streets and buildings committee of the above-named body—a position he had held for ten years. He was the son of a joiner and cabinet-maker at Stockbridge, and succeeded to that business, which he greatly developed, and retired in 1881, though still continuing to act as a valuator of property. Besides his work on the streets and buildings committee, Mr. Dunlop was also chairman of the improvement scheme committee of the Edinburgh Town Council, where his great practical knowledge was of the utmost value to the city in the purchasing of slums and other properties; and he took a leading part in the acquisition of the properties on the North Bridge in connection with the widening of that thoroughfare. To his initiative is due the formation of the Council Museum, and he was chairman of the committee which has that collection under its charge.

## CHIPS.

The Bishop of Gibraltar, who has now completed the twenty-fifth anniversary of his consecration to the See, was presented at Cannes on Tuesday with a portrait of himself in oils, by Mr. H. Olivier. The portrait, which will eventually be hung in Christ Church, Oxford, depicts Dr. Sandford in the robes of an Oxford Doctor of Divinity, and in the background is the Rock of Gibraltar.

The town council of Portobello, near Edinburgh, have received a report from Mr. Cooper, their borough engineer, recommending the widening of the promenade to 50ft., and its protection by a sea-wall, at an estimated cost of £40,000.

On Saturday, Mr. H. C. Richards, M.P., unveiled the new west window of St. Peter, Newlyn, the parish church of the Artists, on the Lands End-road. The window contains memorial lancets to the late Bishop Philpott, of Exeter, and Archbishop Benson, the first Bishop of Truro.

An explosion of acetylene gas occurred on Thursday night in last week at the brickworks of Messrs. C. J. Sanders and Co., near Chesterfield, by which Mr. W. F. Richmond, M.I.M.E., of the firm of Richmond, Stockton, and Co., Limited, Staffordshire, and a workman were injured. For working night shifts at the brickworks an acetylene gas-making plant was being installed by Messrs. Richmond, Stockton, and Co. The explosion occurred within the gas-holder, which was hurled from its position. Mr. Richmond and a workman were buried beneath the ruins, and sustained some injuries. Eight or ten other persons had narrow escapes.

Definite instructions have been given by the Cluney Trustees to Mr. Barron, C.E., Aberdeen, to proceed with the erection of a fish market for Buckie, and workmen are engaged clearing the site on the south side of the Cluney Harbour. The mart will be opened this season.

On Friday, an inquiry was held at the Guildhall, Stafford, before Mr. W. O. E. Meade-King, M.Inst.C.E., one of the inspectors of the Local Government Board, relative to an application by the town council for sanction to borrow £1,200 for carrying out certain alterations in the Guildhall and St. John's Market Hall, for providing an improved council chamber, and justices' room, with offices. The plans were shown and explained by Mr. Blackshaw, the borough surveyor.

A third inquiry by Colonel Hepper, a Local Government Board inspector, was held at Bath on Saturday, into the application of the urban sanitary authority for compulsory powers to purchase property on the upper side of London-street, where an improvement is contemplated. They have power for the lower side, and when another inspector held an inquiry last September into an application to borrow £18,000 for the work, he said it would be unsafe to carry it out unless the property on the upper side were acquired. Evidence was given in support of the proposal by Mr. Fortune, city surveyor, and Mr. A. W. Moore, engineer to the G.W.R. There was no opposition.

In connection with the rebuilding of the Colston Hall, Bristol, destroyed by fire in September last, Sir William Henry Wills, M.P., has undertaken to provide an organ, to be built by Mr. Henry Willis at a cost of £5,000, to take the place of the fine instrument entirely lost in the fire.

## Building Intelligence.

**CAMDEN TOWN.**—The new Bedford Palace of Varieties in the High-street, replacing a smaller structure on part of the same site, was opened on Monday. The new theatre presents a French Renaissance front to the High-street executed in Douling stone, with polished Labradorite and red Shap granite pilasters, surmounted by slate mansard roofs, and a copper dome rising some 60ft. above street level. Entered by three Italian marble steps, is an entrance-hall, with fibrous plaster decorations, gilded ceiling and walls, and floor of mosaic marble; thence, by a corridor 14ft. in width, the main crush-room is reached. This is 20ft. by 22ft. and 18ft. in height, with walls and ceiling of panelled and enriched carton pierre and mosaic floor. From this a short flight of marble stairs leads to the balcony and a lobby to the stalls. The auditorium, which, with a depth of 65ft. and clear width of 56ft., has been built without a column, is treated entirely as the stalls on the ground floor, every person on this tier and in the balcony having a tip-up plush-covered seat. The saloons are at the sides of the auditorium, and separated therefrom by a low brass rail. The private boxes, although on the circle level, are approached solely from the stalls by coved entrances through the ante-proscenium. The style of decoration throughout is Louis Quatorze, with a plentiful introduction of figure paintings in friezes and panels. The proscenium arch and box elevations were specially designed by the architect: standing on richly-ornamented pilasters, two female figures of heroic size partially withdraw a canopy from the boxes, while above a group of Cupids display dramatic emblems. Another group of female statuary surmounts the proscenium arch. The ventilation of the house is assisted in hot weather by the sliding roof, which is controlled by an electric motor in connection with the fireproof curtain. The lighting is by electricity, with gas and oil-lamps as a stand-by, and the heating is by low-pressure hot-water. Mr. Bertie Crewe, of Savoy Mansions, is the architect. The general contractors have been Messrs. W. Johnson and Co. The electric light, gas, heating, fire appliances, &c., have been supplied by Messrs. Vaughan and Brown; the decorations and fibrous plaster by Messrs. Los Saveraux and Co.; furnishing and upholstery by Messrs. Wolfe and Hollander; bar fittings by Messrs. W. Walker and Sons; marble mosaic by Messrs. Diespeker and Co.; and the stage by Mr. W. H. Wood. Mr. George Sheen, from Mr. Crewe's office, has been the clerk of works.

**CREWE.**—The chancel which has been added to Christ Church, Crewe, at a cost of £1,300, was recently consecrated by the Bishop of Chester. The architect is Mr. John Brooke, of Manchester, and the builder Mr. Matthews, of Nantwich. The complete scheme provides, in addition to the new chancel, for a morning chapel on the north side, and new clergy and choir vestries on the south side. The present contract included only the building of the new chancel. Following the method so often found in connection with Medieval churches, the new chancel is in a different style to the existing church, the treatment adopted being the Perpendicular. The chancel is 36ft. long by 20ft. wide. The east window has five lights, the sill being raised high above the chancel floor. In each of the side walls there are windows of two lights forming a clerestory. On the north side there is a double arcade, which will eventually open into the morning chapel, also a credence in conjunction with a squint window from the future side chapel. The old chancel arch is replaced by an arch of lofty proportions, the roof of the chancel having "hammer beam" principals, and a boarded and panelled ceiling. The walls are of brick, with Greenstone dressings to the windows, doorways, arches, &c. The upper part of the inside walls is finished in cement plaster, with a granulated face, the lower parts of the wall being faced with specially made Ruabon bricks. The floor of the chancel and sanctuary is paved with tiles, except the space occupied by the choir stalls, which is paved with wood blocks. The whole of the paving is laid in a thick bed of cement concrete.

**EDINBURGH.**—Plans have passed the Dean of Guild Court for the erection of premises at Lochrin for an Ice and Cold Storage Company. It is proposed to erect an ice manufactory on

ground adjacent to the slaughter-houses. The space measures 112ft. by 95ft., and half of this will be taken up with machinery for ice making, and the other half with the insulated chambers for cold storage. The capacity of the chambers will be about 1,000,000c.ft., but only 30,000c.ft. will be insulated for a commencement. The meat chambers are to be insulated by means of silicate cotton. The refrigerator and ice making is on the Linde system—by ammonia compression. The cost of the undertaking, which is expected to be in operation by June, is about £10,000, £3,000 of which goes for the ground.

**LITTLE TORRINGTON.**—To mark the completion of the restoration of the tower of the parish church a dinner was given at the rectory a few days since. The rector presided, and there were also present Mr. Harbottle Reed, Exeter, the architect; Mr. Grant, of Torrington, the contractor, and his staff of workmen. The upper stage and pinnacles have been rebuilt, a large portion of the buttresses renewed, and the fractured walling made sound. By the removal of the west gallery and placing a new floor in the tower, that part of the church has been greatly improved, and this effect will be heightened by a traceried oak screen, which is to be executed from Mr. Harbottle Reed's design. In addition to the work on the tower, the arrangement of the choir has been remodelled, new oak platforms have been formed for future choir-stalls, and the aisle laid with Jackfield encaustic tiles and new Portland stone steps. The pulpit has been reconstructed, having the old oak panels worked in by Mr. Boundy.

**MORECAMBE.**—A company has been formed for erecting on the promenade a tower of novel design, and rising to a height of 232ft. The tower in general form will be a cone. There will be three dining floors above the ground-floor level. The tower at the base will have a diameter of about 155ft., diminishing to form a platform 52ft. in diameter at the summit, upon which a refreshment saloon will be placed. A spiral road round the outside will ascend by easy gradients from the entrance level to the summit platform, which may also be reached by an electric tramway or hydraulic lifts. The structural steelwork of the tower is calculated to stand the stress of a solid crowd on every portion accessible to the public equal to a weight of 1,000 tons, in addition to its own weight, and a wind stress of 56lb. per square foot over its whole surface. The foundations will be of cement concrete. The interior of the structure will be utilised to form a grand pavilion occupying the whole of the ground floor, accommodating 5,000 persons, and provided with a stage. The summit road for the first circuit will convey the idea of an Oriental street, with shops and cafés on each side, the attendants being dressed in Moorish, Turkish, and similar garb. After leaving the Oriental street the road gradually diminishes from a width of 15ft. to 9ft. at the summit. The share capital of the limited company which is floating the project is £70,000, and it has gone to satisfactory allotment. The architectural and engineering part of the work is in the hands of Messrs. W. H. and A. Sugden, architects, of Keighley, and Mr. R. J. Gifford Read, C.E. Building operations have already commenced, and the pleasure palace will be proceeded with as rapidly as possible.

**SPARKBROOK.**—A new church of St. Agatha is being built in Stratford-road, Sparkbrook, Birmingham, from plans by Mr. W. H. Bidlake, architect, Waterloo-street, in that city. The style is Late Gothic, to be carried out in red brick, with stone dressings and green slate roofs. The main characteristic of the design is that of strength and stability rather than elaborate ornamentation or excessive detail. The walls will be thick, the shadows deep, and the timbers strong. The church will have a front to Stratford-road, a tower over 100ft. in height, flanked by two deep porches, and having at the base a baptistry projecting as an octagonal apse. The nave and aisles lead to the chancel, choir transepts, and vestries, the total length of the building being 170ft. The narrowest part will be 60ft., at the commencement of the nave, but from that point the church is to open gradually until the extreme width of 78ft. is reached at the chancel. Seating accommodation is to be provided for 1,000 worshippers on the ground floor, sufficient to obviate the necessity of a gallery; the organ chamber, which is to be placed over the choir transept, being the only part raised above

the ground floor. The church is to be lighted by traceried windows. The roof will be open, and all the constructional timbers, such as the roof trusses, beams, and ceilings, will be of red deal, the pews of stained deal, and the chancel seats of oak. Room is to be provided in the tower for a peal of eight bells, and one of the latter will be the old bell from Christ Church, Birmingham. The ornamentation is to be mainly confined to the tower, the west side of which will be treated in low relief sculpture. The total cost is estimated at £10,000.

**STOREY'S GATE, S.W.**—The new building at Storey's Gate, Westminster, which has been erected for the Institution of Mechanical Engineers, was formally opened yesterday (Thursday). It adjoins the new premises of Her Majesty's Office of Works. The chief wood employed for internal fitting and furniture is Austrian oak, and many varieties of marble are utilised for the decoration of the tea and smoking-rooms, including a Mexican onyx wall decoration. The lecture-hall occupies the height of two floors. An oak staircase, with carved balusters, Persian-red walls, and a dado leads to the library, the secretary's office, and the reading-room. There are electric clocks, electric lights, and an electric lift. A large room is provided for the storage of past and present records. The building is in the Renaissance style, and the architect is Mr. Basil Slade. It has taken about three years to erect, and has cost about £30,000.

### CHIPS.

This week the North-Western Railway Co. have commenced a series of additions and alterations at Rhyl that will take two years to complete. It is intended to rebuild the south side of the station—that adjoining Vale-road—altogether. An improvement will also be effected at the Vordy, where a new viaduct is being thrown across the river to carry an additional set of rails.

At the meeting, on Tuesday, of the London County Council, the Bridges Committee recommended that the tender of Messrs. Cochraue and Sons, amounting to £109,000, for the construction of the Greenwich footway tunnel be accepted. The original estimate was £65,000, and the engineer's revised estimate £83,175. The recommendation stands over for a week.

The Mersey Docks and Harbour Board considered on Friday a recommendation by the Works Committee involving the expenditure of nearly one million sterling. Some time ago a general scheme for improving and extending the dock system was agreed to, the total estimated expenditure being close on four millions, and, Parliamentary powers having been obtained, it is now proposed to proceed with the first instalment of the work. This portion of the scheme, which includes the construction of two new graving docks, will probably cost £885,335. The committee's recommendation was allowed to stand over for a fortnight in order to comply with the Standing Orders.

On Thursday in last week, Mr. W. O. E. Meade-King, C.E., an inspector of the Local Government Board, held an inquiry at the Trent Valley Hotel, Lichfield, as to an application by the Lichfield Rural District Council for the issue of a provisional order for the compulsory acquisition of land for the purposes of sewage disposal for the township of Streethay. The plans have been prepared by Mr. W. E. Rogers, surveyor to the urban district council of Rugeley.

Mr. Thomas Winn, C.E., of Leeds, the umpire in the recent arbitration proceedings in regard to the Jolly Butchers Inn, Rawson-place, Bradford, has decided that the price of the property, which is required by the corporation for market extensions, should be £10,532 8s. The owners' claim was for £11,349, and the corporation's estimate was £8,000. Mr. William Weatherhead was the arbitrator for the claimants, and Mr. W. B. Woodhead was arbitrator for the corporation.

The improvement committee of the Birmingham Corporation have granted a lease of 75 years to Mr. T. C. Sharp, civil engineer, Corporation-street, Mr. J. P. Sharp, architect, Martineau-street, and Mr. C. Osborn, merchant, Edgbaston-street, of a plot of land on the eastern side of the lower end of Corporation-street, having frontages to streets of 48ft., 43ft., and 62ft., and containing an area of about 672 square yards, at the rate of 7s. 6d. per square yard, or £252 per annum.

A special meeting of the Blackpool Town Council was held on Friday to confirm the resolution passed at a previous meeting, that the improvement Bill, which includes the widening of the promenade at a cost of £345,000, be proceeded with. After much discussion, the confirmation was carried by 33 votes to 2.

## Engineering Notes.

**CHESTER-LE-STREET.**—A new bridge over the River Wear has just been opened by the Right Hon. the Earl of Scarborough, near his seat at Lumley Castle. The bridge consists of a centre span of 120ft., and two side spans each 37ft. long. The main and approach girders are of mild steel lattice-work, the bottom flanges being efficiently wind-braced, and the top flanges supported with struts and overhead arches. The flooring consists of creosoted timber, with water-boards at each side. The piers are each composed of four large wrought-iron piles, properly braced, formed of four segments riveted together with cast-iron pile joints, and driven 21ft. below the river bed. Gates and proper turnstiles are fixed at the end of the bridge, and proper lighting arrangements are provided. The structure is calculated to bear a safe distributed live load of 140lb. to the square foot, with four times this amount for the ultimate load. The engineers were Messrs. D. Balfour and Son, of London and Newcastle-on-Tyne, and the erection has been carried out by Messrs. Head, Wrightson, and Co., of Stockton-on-Tees.

**SOCIETY OF ENGINEERS.**—The first ordinary meeting of the Society of Engineers for the present year was held on Monday night at the Royal United Service Institution, Whitehall. Mr. W. W. Beaumont, the president for 1898, occupied the chair, and presented the premiums awarded for papers read during that year—viz., the President's gold medal to Mr. W. Fox, the Bessemer premium to Mr. S. O. Cowper-Coles, the Rawlinson premium to Dr. J. C. Thresh, and a society's premium to Mr. G. Thudichum. Mr. Beaumont introduced the president for the present year, Mr. John Corry Fell, to the meeting, and retired from the chair, receiving a unanimous vote of thanks for his services during the past year. Mr. Fell then delivered his inaugural address. The financial position of the society, he said, was very satisfactory, and it had increased its numbers during 1898. During the past year they had lost six honorary members, Sir William Anderson, Sir Henry Bessemer, Sir James N. Douglas, Sir John Fowler, Lord Playfair, and Sir Robert Rawlinson. The vacancies thus created had been filled by Sir J. Wolfe Barry, Sir A. J. Durston, Sir David L. Salomons, Professor A. B. W. Kennedy, Mr. W. H. Preece, and Mr. A. Siemens. It was a curious fact that civil engineers availed themselves less than any other members of the profession of the privileges accorded to inventors by patent, designs, or copyright protection. It had been said that the British nation was less inventive than the American, and prior to 1883 that view appeared to be supported by the number of patent applicants in the United States as compared with those in Great Britain; but upon a reduction of the fees in 1883 the applications had reached over 30,000 per annum, and Great Britain now took a foremost place in the inventive world. With regard to successful invention, the conditions should be the result of analysis or synthesis, not mere chance dashes into an unknown field. Mr. Fell pointed out the necessity of having a special court for the trial of patent actions. He had for long past been of opinion that such a court should be established, and of late the Lord Chancellor and other judges had expressed the same views. They had publicly attributed the block in the Law Courts to the increasing number of patent cases, and the inordinate time many of them occupied. The president then gave a summary of the advances made of late years in various departments of engineering. A vote of thanks was accorded to Mr. Fell.

A coroner's court and public mortuary is about to be built in the High-street, Poplar, from plans by Messrs. Lansdell and Harrison, of Bow-lane, Cheap-side, selected in open competition. The style adopted is English Renaissance, to be carried out in red brickwork and stone.

Several extensive works are being carried out by the Admiralty at the Royal Naval Hospital, Plymouth. The steam laundry is being enlarged by Messrs. A. R. Lethbridge and Sons, of Plymouth; the contract has just been signed with Messrs. Tozer and Son, of Plymouth, for the erection of a block of buildings for officers close to the hospital church within the grounds; and beyond these are four infectious model blocks and pavilion. All these works are in the vicinity of the North Gate.

## COMPETITIONS.

**GUERNSEY.**—We are asked to say that Mr. J. M. Brydon did not accept the invitation to compete for the States House and Courts, Guernsey. In giving the result of this competition a fortnight since, we printed the list of architects invited, and inadvertently omitted to state that Mr. Brydon did not compete.

**HARROGATE.**—The overcrowding at the old Pump-room, Harrogate, during the past season has resulted in the Corporation inviting competitive plans for a new building and alterations to the present structure. Mr. George Corson, F.R.I.B.A., of Leeds, who was the assessor appointed by the Corporation, has made his awards as follows:—For new pump-room—(1) £50, Mr. F. Anderson, 18, Adam-street, Adelphi, W.C.; (2) £30, Mr. A. A. Gibson, Harrogate; (3) £20, Messrs. Eade and Johns, Ipswich. For an altered and enlarged building—(1) £30, Mr. F. Anderson, London; (2) £20, Mr. E. Jenkinson, Cardiff; (3) £10, Messrs. Hunt and Shield, 3, New Inn, Strand, W.C.

**PETERBOROUGH.**—In the competition for the rebuilding of the Guildhall, the city council, acting on the advice of Mr. J. C. Traylen, of Stamford, the assessor, have awarded the first premium of £20 to Mr. A. E. McEwan, A.R.I.B.A., Birmingham; the second, of £15, to Mr. Charles Bell, F.R.I.B.A., Salters Hall-court, London, E.C.; and the third, of £10, to Messrs. C. E. Mallows and G. H. Grocock, of Bedford.

**PLYMOUTH.**—With reference to the Tavistock-road competition, the assessor, Mr. Sydney R. J. Smith, F.R.I.B.A., of London, has made his award. He has given Mr. Herbert T. Buckland, architect, Birmingham, as the successful competitor. The premium was £250. There were nine competitors.

## CHIPS.

The Holy Trinity Church Restoration Committee met at the town-hall, Hull, on Monday. The architect, Mr. Brodric, reported with regret that the tenders sent in for the work of restoration already amounted to £600 more than his estimate. With regard to the stonework, the committee decided to seek other tenders. The question of electric lighting was referred to a sub-committee, and it was decided to adjourn consideration of the restoration of the bells.

Two windows, designed and painted at the studio of Mr. J. W. Knowles, of Stonegate, York, have been erected in Acomb Church. One represents the Adoration of the Magi, empannelled under canopies of the Perpendicular Period. The other window represents the figure of the Virgin standing under rich canopies.

The engineers' half-yearly report on the progress of the London Central Railway to Dec. 31 states that the expenditure to date has been £2,445,076. The main line and station tunnels are completed, with the exception of 100 yards which remain to be constructed at the Bank Station. Progress has been made with the power station and depot at Shepherd's-bush, and the large buildings for the rolling stock and electrical machinery are approaching completion. At several of the station sites building operations are in progress, and the erection of the electric lifts is in hand. The materials for the permanent way are in course of delivery, and the rails are being laid down.

The members of the Metropolitan Fire Brigade are about to have cast upon them the duty of periodically inspecting all the theatres in London licensed by the Lord Chamberlain, with a view to seeing that proper arrangements are made for the prevention of fire, that the fire appliances are in good condition, and that the water-supply is adequate in case of fire. A special staff, consisting of a superintendent, foreman, and engineer, is to be appointed for the work, and the officer at present in charge of the Southwark headquarters, Mr. C. R. Couch, who is the senior foreman of the brigade, will be promoted to the superintendentship.

A monument erected in the Market-place, Horn-castle, at a cost of £500, to the memory of the late Right Hon. Edward Stanhope, M.P., was formally unveiled on Thursday in last week. The monument, which is 31ft. high, stands on a bed of concrete 14ft. square and 2ft. thick. It is built mainly of Monks' Park stone, with a superstructure of oak and gun-metal. The work was designed and selected in competition by Mr. E. H. Lingen Baker, of Hereford. The stone carving and modelling of the medallion of Mr. Stanhope in one of the panels was executed by Mr. C. J. W. Ladds, of Keele Rectory, near Spilsby. The contractors for the whole were Messrs. Walter and Hensman, of Horncastle.

## LEGAL INTELLIGENCE.

**DAMAGES FOR INFERIOR MORTAR.**—**SMITH v. JOHNSON.**—Mr. Justice Bruce and a jury heard in the Queen's Bench Division last week an action to recover damages for breach of contract. The plaintiff is a lodging-house keeper in Whitechapel, and the defendant is a builder and contractor. The plaintiff was building a dormitory to one of his lodging-houses, and contracted with the defendant to supply the mortar. The mortar was supplied, and the building erected. After the building had been erected, the plaintiff was served with a notice from the County Council to pull down and rebuild, on the ground that the mortar was not in accordance with the requirements of the Building Act, 1894, which requires one part of lime to three parts of grit or sand. The plaintiff pulled down and rebuilt, and sought to recover from the defendant the whole cost of pulling down and rebuilding, and also the loss of ground rent. It was proved that the mortar was defective, and the learned Judge found that it was so supplied by the defendant. The plaintiff also proved that in a wet state the inferior quality of the mortar could not be detected. Mr. McIntyre, for the defendant, argued that the damages were too remote. It could not have been in the contemplation of the parties that, if the mortar was bad, the plaintiff would have to pull down and rebuild. If the defendant supplied bad mortar, the plaintiff should have rejected it. He cited "Baldwin v. London, Chatham, and Dover Railway." Mr. Rufus Isaacs, Q.C., for the plaintiff, contended that the damages were the natural consequence of the defendant's act. The test was whether the defective quality of the mortar could have been detected before being used. He submitted that it could not, and the defendant was liable for what happened by its use. Mr. Justice Bruce held that the question was whether the plaintiff, by reasonable diligence, could have discovered the defects in the mortar before using it. He thought the evidence was that he could not when the mortar was in a wet state before being used, and the cost of pulling down and rebuilding could properly be recovered from the defendant. The plaintiff was also entitled to damages for loss of ground-rent. Judgment was given for the plaintiff for £101.

**THE STATUS OF THE ABBEY MANSIONS.**—**DRURY v. RICHARD.**—In the Queen's Bench Court, on Monday, Mr. Justice Lawrance and Mr. Justice Channell heard and gave judgment in a special case stated by Mr. Marsham, a Metropolitan magistrate, raising a question as to the Abbey-mansions, Victoria-street—namely, whether they were vested in and were in the occupation of a Government Department. Mr. Daldy appeared for the appellant, Edward Drury, a district surveyor under the London County Council; Mr. Avory appeared for the respondent, William Rose Rickard, builder and contractor. A complaint was made by the appellant under the London Building Act, 1894, that, in erecting Abbey-mansions, north and south blocks, Victoria-street, certain things had been done in contravention of the said Act by the respondent. The respondent was a builder employed by C. J. C. Pawley, architect, and was engaged on June 1, 1898, in erecting the south block of the building in question. It was erected to a greater height than 80ft. without the consent of the London County Council, and, if the Act applied, in contravention of section 47 of the Act. A notice of irregularity was served on the respondent, who claimed that, by reason of section 202 of the Act, the building was exempt from the operation of the Act. That section contains the following provision:—"There shall be exempt from so much of the provisions of this Act as relates to buildings and structures . . . any building, structure, or work vested in and in the occupation of any Department of her Majesty's Government." The respondent was erecting the said building for, and under the supervision of, C. J. C. Pawley, who was acting as architect of the building, but subject to the approval of the Surveyor of the Commissioners of her Majesty's Board of Works. The agreement between Pawley and the Commissioners was made on November 19, 1897, and Pawley (therein called the landlord) agreed to grant, and the Commissioners agreed to take, a lease of a piece of land with the messuage therein described as then in course of erection "for the term of 21 years, from December 25, 1897, or so soon thereafter as the buildings should, in the opinion of the officers of her Majesty's Office of Works, be fit for occupation." No such certificate had been given by the officers of the Office of Works, and the Commissioners had now refused to take over the buildings. One of the officers of the Commissioners of Works had on several occasions during the building visited the buildings and made suggestions. The appellant contended that the buildings were in the occupation of Pawley, and not in that of any Government Department, and at any rate would not vest in the Government until the commencement of the term of 21 years mentioned in the agreement. The magistrate was of opinion that the building came within the section 202, and was, therefore, exempt. He accordingly dismissed the complaint, but stated

a case for the opinion of the Court upon the question whether the buildings were exempt. Other questions were raised before him, but their decision did not become necessary if his view was right. Mr. Daldy said that the buildings were not exempt, and the respondent should have been convicted. The magistrate thought the whole question turned upon the construction of the agreement, and did not consider the circumstances of the case, which showed that the Government were not in occupation. The Government had agreed to take a lease from a date which might not arrive at all, and had not arrived in fact yet. Therefore there was no vesting of the buildings in the Government. The premises were occupied, if by anybody, by the builder. The only evidence of occupation by the Crown was that their surveyor would occasionally visit the buildings. Under the statute there must be both vesting in and occupation by the Crown. The lessees of Crown property generally ought to be liable to the provisions of the Act. Mr. Avory said the exemption given by the Act could not apply at all if it did not apply to buildings in course of construction, because no Government department could enter into occupation until the building intended for the occupation was completed. The clause meant that if buildings were vested in Government and intended for the occupation of a Government department, they should be exempt, otherwise the section would be of no effect. That, however, was the smaller point. The building was also vested in the Government. The document was a lease in equity. The Court held that the case must go back to the magistrate to decide the other points which he had not dealt with. Mr. Justice Lawrence, after referring to the facts, said that it was impossible to say that the buildings were "vested in and in the occupation of any department of her Majesty's Government." The magistrate was therefore wrong in the view he took. Mr. Justice Channell concurred. Difficulties had been pointed out by Mr. Avory as to the occupation of Government departments in buildings that were being built for them by contractors. If, however, there was in any real sense a vesting of the buildings in Government, it would probably be held not to be very difficult to make the occupation sufficient. He could not, however, see the equitable interest here. The contract was this, that the Government would take the buildings for 21 years from December 25, 1897, or so soon thereafter as the buildings should, in the opinion of the officers of her Majesty's Office of Works, "be fit for occupation." There was, therefore, no compulsion on the Government to take the premises until the opinion of the officers that the buildings were fit for occupation had been given. Where there was an option of that description no equitable interest arose until the election had been made. No case had been cited to contradict that view. It followed that these buildings were not vested in the Government department, and the matter must therefore go back to the magistrate.

**AN ARCHITECT'S ACTION FOR FEES.—**TYLER V. RENAD.—Mr. Justice Bruce and a common jury heard in the Queen's Bench Division, on Monday, an action brought by Mr. Robert Emeric Tyler, F.R.I.B.A., 22, Queen-street, E.C., against Mr. Charles Renad and Mr. Frederick Renad, well-known acrobats, to recover £300 in respect of fees for preparing the plans and drawings for a theatre at Tottenham. Defendants denied liability. Plaintiff stated that on January 25, 1897, he was introduced to Mr. Frederick Renad, who informed him that he and his brother proposed to build a theatre at Tottenham, and asked whether he would act as architect. He agreed to do so, and, in accordance with instructions which he received from Mr. F. Renad, he prepared the necessary plans and drawings, which had to be submitted to the district council at Tottenham and the Middlesex County Council. The plans were passed by these authorities, quantities were taken out, and builders were invited to tender for the erection of the theatre; but eventually the scheme fell through owing to the fact that the necessary money was not forthcoming. He now contended that he was entitled to recover from the defendants his fees at the rate of 3 per cent. on the lowest tender submitted. The defendants denied that they instructed the plaintiff to prepare the plans and drawings in question, and contended that, if he prepared them at all, he did so at the request of the Albert Theatre Syndicate (Limited), which was formed for the purpose of purchasing the freehold of the Tottenham Public Hall and adjoining land, and erecting a theatre on the site. They further said that the plaintiff was a member of the syndicate, and that his remuneration was dependent on the success of the scheme. Plaintiff, in reply, said there was no ground for the suggestion that he prepared the plans and drawings on behalf of the syndicate. As a matter of fact, he did not hear anything about the syndicate until some time had elapsed. The jury found a verdict for the plaintiff, and assessed the damages at £258 13s. Judgment accordingly.

**IN RE HENRY DEE, BUILDER, OF WALTON.**—This debtor presented himself for examination at the Kingston Bankruptcy Court on Tuesday week. The

statement of affairs showed unsecured liabilities amounting to £2,825 19s. 1d. Debtor alleged that his failure had been caused through losses on contracts, speculative building, alterations and improvements to premises, bad debts, and the ill-health of his wife and himself. According to the Official Receiver's report, the debtor commenced business as a builder and contractor at Walton in 1886 with a capital of £150, in addition to which his father lent him £300. The father was now shown as an unsecured creditor for £700, and as a partly secured creditor for £300. The furniture on debtor's premises were claimed by his wife. The books produced had been imperfectly kept, and the debtor stated that some of the books were accidentally destroyed by fire about Christmas, 1897. The Registrar adjourned the examination till February 28th.

**"SCAFFOLDING" AND THE WORKMEN'S COMPENSATION ACT, 1897.**—At Marylebone County Court, his Honour Judge Stonor delivered judgment on Wednesday week in the case of "Stack v. Coulse Brothers." The applicant was injured on September 8th by the fall of a joist while he was working, and it was admitted that he was entitled to an award in his favour if the building upon which he was engaged was within the provisions of the Act. The building where the accident happened was much lower than 30ft. in height, and on its floor there were at the time of the accident two pairs of trestles with two boards resting upon them as a temporary scaffold to enable the workmen to work at the roof or ceiling, and in the basement below there were other pairs of trestles with boards resting on them for a similar purpose. To bring this case within the Workmen's Compensation Act (section 7) it must be shown that the building in which the accident occurred "was being constructed or repaired by means of a scaffolding." His Honour said, with reference to this point, he thought that the building now in course of erection was not being "constructed or repaired by means of a scaffolding," for he thought that the proper meaning of "a scaffolding"—at all events, for the present purpose—was that in which it was used by employers and workmen in their business, and by everyone in common parlance given in the "Glossary of Architecture" (5th edition), Vol. I. p. 414—viz., "a temporary erection of poles, planks (boards), &c., for the use of workmen in building walls or executing any work which they cannot otherwise reach"—which is always secured and fixed, and not a temporary erection of two pairs of trestles with boards across them, unfixed, unsecured, and movable by the workman as occasion may require. The prefix of the article appeared to him to remove all doubt from the subject, and he must add there was strong argument in favour of attaching the meaning given by the glossary to the word in the clause under consideration from its manifest restrictive intention and operation with regard to the building business. It began by first restricting such operation to buildings "30ft. in height," no doubt on account of the additional danger attending on buildings of that and greater height, and then proceeded further to restrict it to such buildings if they were "constructed or repaired by a scaffolding," no doubt also on account of the additional danger arising from the use of the same. Now, if this was to extend to every unfixed and movable erection of trestles, boards, ladders, &c., as contended on the part of the applicant, these words would be wholly nugatory, inasmuch as every building 30ft. high must be constructed by such means, at all events as to the roofs, ceilings, &c., and the words "constructed or repaired by a scaffolding" would have no effect, restrictive or otherwise, whatsoever. Again, the position of this further restriction and provision, coming immediately after and in conjunction with the restriction as to height, pointed, he thought, clearly to such "a scaffolding" as is used of necessity in the construction or repairing of buildings of that, or at all events of considerable, height. He, therefore, found for the respondents upon the second point which they had raised, and he dismissed the application.

**THE COUNTY COUNCIL STAIRCASE.**—An arbitration case of interest to owners of property in the City was heard at the Law-courts on Thursday in last week, when Mr. E. A. Gruning sat as umpire in the case of the London County Council v. the Lewis Trustees. The trustees—Mr. Louis Lewis, Mr. Edwin Spurr, Mr. George Lewis—own a large amount of property in various parts of the Metropolis, and in particular are the owners of 21, Moor-lane, which is let to a number of tenants, whose employees number about one hundred. The proceedings arose out of an order made by the Council under the Factory and Workshops Act requiring the trustees to provide the premises with a fireproof staircase, bridges to adjoining premises, new doorways, and other matters calculated to cost from £500 to £800. The trustees objected to carry out alterations on that extensive scale on the ground that they were unreasonable and not required; but, as a counter proposal, they offered to coat the existing staircase with fire-resisting paint, to provide a means of

access to the roof, to furnish movable "fire-escapes," and to undertake alterations at a cost of about £100. Mr. J. B. Slater, of 46, Berners-street, and Mr. E. Flint, of 80, Coleman-street, had been appointed arbitrators in the case, but, as they were unable to agree, reference to the umpire was necessary. Mr. Daldy, for the County Council, contended that the requirements of the Council were only such as could be reasonably required by the Factory Acts. He argued that for the purposes of the protection of life in the case of fire, old buildings—in other words, buildings erected before the Act of 1891, as were the premises in question—and new buildings were in precisely the same category. The meaning of the section was that owners should take reasonable precautions to protect the workpeople in case of fire, and not that workpeople should take a reasonable amount of risk. The Legislature never intended that the employees in an old building should be exposed to double or treble the risk that employees in a new building were exposed to. Mr. T. Blashill, superintending architect to the Council, gave evidence to the effect that the present staircase was not an adequate means of exit. If the partitions, which were now partly of glass, were filled entirely with wood and painted with a fire-resisting material, he did not think that would be a sufficient alteration, as the staircase was neither light enough nor wide enough, and would rapidly fill with smoke. He estimated the cost of the alterations referred to in the order at between £500 and £600, and would be surprised if it cost £800. Mr. Capon, chief assistant to Mr. Blashill, generally agreed with the testimony of the previous witness. Mr. Atkin, on behalf of the trustees, contended that it could not be "reasonable" to require his clients to practically rebuild their premises, which was what the order, if carried into effect, would amount to. He drew a sharp distinction between old buildings and new, and held that all that the Legislature required in the case of the former was for their owners to provide an adequate supply of what he termed "movable" fire-escapes and appliances. He asked the umpire to find that the County Council's demands were unreasonable. Mr. Richard Pearson, the inventor of several specialities for protection against fire, demonstrated the value of his paint, with which the old staircase, &c., were to be coated, and he also showed an automatic electric fire-alarm, with which the building would be fitted. Professor Vivian B. Lewis, gas inspector of the corporation, spoke of the great value of these contrivances. Mr. Gruning reserved his decision.

**ARBITRATION AS TO WHARVES AT VAUXHALL.**—Mr. Under-Sheriff Burchell and a special jury, at Red Lion-square, Holborn, heard, on Tuesday, the case of "Francis and Co., Ltd. v. the London County Council," a claim for compensation in respect of the leasehold interest in a wharf adjoining the southern end of Vauxhall Bridge, S.W., used as a distributing centre for cement manufactured at Cliffe on the Medway. Sir John Whittaker Ellis (Farebrother, Ellis, Egerton, Breach, Galsworthy, and Co.) stated that the wharf was held for a term of nearly 50 years unexpired at a ground rent of £515 per annum, and that the present rack-rental value of the property was £1,615, showing a profit rental of £1,105, which he capitalised on the 5 per cent. tables, making, with the customary addition of 10 per cent. for compulsory sale, a total for the leasehold interest of about £22,000. He was of opinion that three years' purchase of the net profits, or about £18,000 should be allowed for displacement. Mr. James Green (Weatherall and Green), Mr. Edward Holroyd Bousfield (Fox and Bousfield), and Mr. Stenning gave confirmatory evidence. On behalf of the London County Council, Mr. Edmund Farmer (Debenham, Tewson, Farmer, and Bridge-water) estimated the annual value of the wharf to the claimants as tenants carrying on business at £900 a year, from which he deducted the ground rent, £515, giving a profit rental of £385 per annum, and he capitalised that on the 6 per cent. table, 15½ years' purchase, £5,064, and added the customary 10 per cent. for compulsory sale, making £6,670 for the leasehold interest. He expressed the opinion that a round sum of £5,000 in addition would amply compensate the claimants for the disturbances of their business, and they should also receive an agreed amount of £920 for the fixtures, as valued by Mr. Fuller Smee (Bradshaw Brown and Co.). Mr. Alderman Samuel Green (Green and Sons), Mr. James F. Field (Field and Sons), past president of the Auctioneers' Institute, Mr. Barker, and Mr. Andrew Young (valuer to the London County Council) gave confirmatory valuations. The jury awarded the claimants £13,563 in respect of the leasehold interest (inclusive of the customary allowance of 10 per cent. for compulsory sale), £9,643 for the disturbance of the business, and £920 for the fixtures—a total compensation amounting to £24,126.

Mr. G. W. Willcocks, on January 30th, conducted an inquiry at Herne Bay into the application of the urban district council to borrow £17,000 for the purposes of sewerage, &c.

ORIGINAL DRAWING FOR A PAINTED WINDOW, SWISS WORK, MDXL.—WORCESTER HOP MARKET HOTEL.—PRINCESS MARY CONVALESCENT HOME, BOGNOR.—COTTAGES AT PORT SUNLIGHT.—CHURCH OF ST. MARY MAGDALEN, ACCRINGTON.—HOUSE, STUDIO, AND BUNGALOWS AT PEVENSEY BAY.—MUNICIPAL OFFICES AND TOWN HALL, DUKINFIELD.

## Our Illustrations.

ORIGINAL DRAWING FOR A PAINTED WINDOW, SWISS WORK, MDXL.

SIR CHARLES ROBINSON has very kindly placed at our disposal a series of original historic drawings of decorative design selected from his exceedingly rich and varied collection, and to-day we have chosen a stained-glass cartoon by an unknown Swiss artist, the date attributed to the design being 1640. The composition is essentially typical in its architectonic character, and from the freedom of the detail it may fairly be assumed that the draughtsman contemplated executing the design himself. It is evident that the best glass must be carried out either in this way by the artist, or, at any rate, by a glass-painter who in artistic capabilities is second only to the designer. The figures in the panel herewith illustrated are both picturesque and dignified, and are drawn with a due regard to the limitations of the material. As an example of the period to which the work belongs it must be judged, and, in fact, herein lies its value. Opinions necessarily will differ as to the good taste or otherwise in the suggested perspective, which makes so conspicuous a feature in this design, while its very freedom we know to some will rank as an objection. Others, again, will question the propriety of grouping figures of differing scale. And yet, after all, it must be admitted that the design is, as a whole, very graceful and cleverly composed—a most interesting performance. Singularly unlike much of the Swiss glass, this cartoon seems to have been intended for a church, though it is just possible that the panel might have found a place in the council chamber of some Swiss town or a guildhall. There existed a happy interchange among the art guilds of the 16th century which led to gifts between friendly corporations, and these sometimes took the form of glass panels of this kind. They were, however, more generally of an heraldic nature, such as some which can be seen at South Kensington Museum, or in the Hôtel Cluny at Paris. The Rathaus at Lucerne is rich in later examples. We shall give some examples of the type just mentioned later on, and feel sure they will be appreciated by our artistic readers.

THE HOP MARKET HOTEL, WORCESTER: SELECTED DESIGN.

The rebuilding of the Hop Market Hotel is consequent upon the proposed widening of Foregate-street by the corporation of Worcester, the width of this main thoroughfare being at the present time very limited, and with tram and

vehicular traffic is frequently congested. The Hop Market and warehouses at the rear are governed by a board of guardians, consisting of 34 members and 11 representatives of the corporation. The first board appears to have been formed about the year 1703, when a governor, deputy governor, clerk, &c., were appointed, the profits accruing from the Hop Market being divided amongst certain parishes in the city. The premises now occupied as a hop market were first erected as a general workhouse for the poor, and in the year 1712 the market, then held in the Corn Market, was removed to the said workhouse, portion of the same being utilised for the purpose of a warehouse. The hotel was subsequently erected early in the present century on the site of such warehouse. The design and plans illustrated were those selected by the board of guardians in a competition limited to local architects, and were prepared by Messrs. H. Rowe and Son. Owing to the large area of the site required as a courtyard for the transaction of business, the space left for hotel accommodation is limited, and is little more than one room deep, and it has been found necessary to utilise the basement for administrative purposes, billiard-room, stores, &c. The bar, coffee, and commercial rooms have been arranged as conveniently as circumstances would permit. There will be a limited number of private sitting-rooms and about 36 bedrooms.

PRINCESS MARY CONVALESCENT HOME, BOGNOR.

THE Convalescent Home at Bognor, in connection with the East London Hospital for Children at Shadwell, was opened in November last by Lady Maria Hood. The materials used for the walling are red bricks from Tortington, and, as the building is in a very exposed position, all the walls are built hollow, with the exception of the front portions of the upper floors, which face the sea, and which are inclosed with solid brick walls, protected by vertical Broseley tiling fastened to coke-breeze fixing-blocks built in with the brickwork. The roof is likewise covered with dark brindled Broseley tiles. The home is built to accommodate 20 convalescent children in the two upper dormitories, and there are two small wards on the ground floor containing four beds each for surgical cases. The building was erected by Mr. Arthur Burrell, builder, of Arundel and Littlehampton. The architects were Messrs. Cheston and Perkin, of London.

COTTAGES AT PORT SUNLIGHT.

THE two groups of cottages at Port Sunlight illustrated have been erected from the designs of Messrs. T. M. Lockwood and Sons, architects, of Chester.

CHURCH OF ST. MARY MAGDALEN, ACCRINGTON.

THIS church is in course of erection for a newly-formed parish on the outskirts of the town. In consequence of the rapidly sloping site the vestries are placed under the chancel. In conjunction with the south transept there is a morning chapel, the north passage of the latter providing a return aisle from the chancel for communicants. The external walls are faced on both sides with Halifax wallstone; the external ashlar is from the same neighbourhood, while Storeton Hill ashlar is being used for the inside dressings. It is proposed to cover the roof with thick green slates. The portion to be built in the first instance comprises the chancel, morning chapel, transepts, and two bays of the nave. Mr. James Waddington is the builder employed, not under contract; he will act also as clerk of works up to the completion of the church. The drawing is by Mr. Langham. Mr. Henry Ross is the architect.

HOUSES, PEVENSEY BAY, SUSSEX.

THESE houses are now being erected close to the sea in Pevensy Bay, near Eastbourne, for Mr. Val. C. Prinsep, R.A., who has recently acquired a considerable quantity of land in this bracing and sunny bay. The detached house with studio at back is for Mr. Prinsep's own occupation. All the houses are faced on the ground-floor with red bricks from Tunbridge Wells, and above the ground-floor with hard local stock-bricks, cemented, rough-cast, and whitened. Sea-green Westmoreland slates are to be used for the roofs. All external woodwork is to be finished a strong green. All walls are built hollow. The houses have been designed by Mr. Frank J. Brewer, F.R.I.B.A., of Richmond, Surrey, and Buckingham-street, Adelphi, London, and are being erected by Mr. Mark Hookham, builder, of Eastbourne.

SELECTED DESIGN FOR TOWN HALL, DUKINFIELD, CHESHIRE.

THE site for the town hall, Dukinfield, is in King-street; the building will be set back about 80ft. from the street. The elevations are of Accrington bricks, with stone dressings. On the ground floor are the school-board offices, rates and water-works departments, the borough cashier's offices, the surveyor's department, the sanitary inspector's office, and the gas offices. On the first floor there will be the council chamber, 50ft. by 30ft., the chairman's room, the committee and law clerk's offices, the overseer's offices are also on this floor, as well as two large committee rooms. The basement will contain the fire-brigade station, ambulance station, inspector of weights and measures department, the heating chamber, &c. The architects are Messrs. John Eaton, Sons, and Cantrell, of Ashton-under Lyne, whose design was selected in open competition.

## CHIPS.

Three new sub-building inspectors are to be appointed by the Leeds Corporation.

Mr. Pittendrigh Macgillivray, sculptor, to whom a remit was made on the subject, has recommended that the proposed statue of Byron for Aberdeen should be of bronze. The cost of the figure is estimated at £1,600.

A new sessions-house is now being erected at Ely, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

The parish church, Biggin, Derbyshire, has just received an addition in the shape of a tower clock, which has been erected at the cost of Mrs. Wraith, in memory of her father. It has two dials facing north and south, and strikes the hours. Messrs. Smith and Sons, Midland Clock Works, Derby, carried out the work.

The new infectious diseases hospital, Chester, which is nearing completion, is being erected from the plans and under the supervision of Mr. H. Beswick, county architect, Chester, the builder being Mr. W. W. Freeman. The whole of the wards are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, Manchester grates, Shorland's patent exhaust roof ventilators and inlets.

At East Float, on the borders of Seacombe and Birkenhead, Messrs. W. Vernon and Sons opened, last week new flour mills, which will find employment for 400 men. The walls are four stories high, and built from designs by Mr. John Clarke, F.R.I.B.A., Castle-street, the milling machinery being supplied by Messrs. Simon, Limited, of Manchester. The engine-room, which is 40ft. by 35ft. and 50ft. in height, has been fitted up by Messrs. Wareing and Gillow, of Bold-street, Liverpool. The floor consists of marble mosaic, and the walls have a dado of bottle-green and teapot-brown tiles, the upper portions being treated with sgraffito in buff and Indian red worked into panels.

Operations will at once be begun in connection with the erection of a new lighthouse at Barn Ness, on the Haddingtonshire coast, near Innerwick, which has for many years been the scene of numerous wrecks. The lighthouse is to stand 100ft. high, the district being a very low-lying one, and accommodation is also to be provided for lighthouse-keepers' houses and stores. The light will be a group, flashing three flashes in quick succession every half-minute. The beam of light of each of the flashes will be 78,000 candle-power. It is also proposed at an early date to erect a lighthouse on the Bass Rock.

The ancient parish church of Kirton, near Boston, has just been restored at a cost of about £4,000. The church, up to the end of last century, was one of the finest fanes in Lincolnshire. In 1800 the parishioners pulled down the grand central tower, and rebuilt a new one at the west end. Under the restoration just completed the ancient parts of the church have been restored, and the chancel improved. Mr. C. Hodgson Fowler, F.S.A., of Durham, was the architect. The church has been reopened by the Bishop of Lincoln.

Within a few months the colossal statue of Ferdinand de Lesseps, by Frémier, will be cast. Nearly 22ft. in height, it will stand on a pedestal 36ft. high, decorated with the portraits of the four Khedives who helped the engineer in his great work. This new colossus will be set up at the entrance of the Suez Canal.

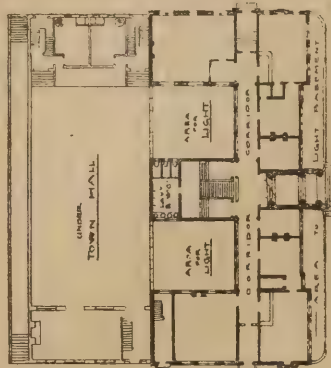

The expenditure of the Great Northern Railway Company for the year on proposed new works includes £390,500 for widenings and improvements at Peterborough; £21,000 for widening bridges at Grantham; and £5,300 for a bridge over the River Welland at Deeping.

### PROFESSIONAL AND TRADE SOCIETIES.

**BORDER COUNTIES MASTER PAINTERS' ASSOCIATION.**—The annual apprentices' competition and exhibition under the auspices of the Border Counties Master Painters' Association was held in the Burns Hall, Galashiels, on Saturday. The competition was conducted on entirely new lines, the competitors being put to a thorough test of their merits in the hall under the superintendence of Mr. Brown, Dundee, president of the Master Painters' Association of Scotland, and were divided into three grades, the first being for fifth and sixth year, the second for third and fourth year, and the third for first and second year apprentices. The theoretical test was first applied, after which the practical work was carried through, the tests being oak graining, plain, raised, and shaded letters, two hours being allowed for each subject. The awards for practical work were:—Letters: First Grade—1, Adam Armstrong, Galashiels; 2, E. Vannan, Galashiels. Second Grade—1, J. Hill, Hawick; 2, J. Mackinson, Galashiels. Third Grade—1, Gilbert Tait, Galashiels; 2, Andrew Gardiner, Hawick. Oak Graining: First Grade—1, Adam Armstrong; 2, J. Black; 3, R. Reavely; 4, Ebenezer Vannan, all of Galashiels. Second Grade—1, J. Hill, Hawick; 2, Wallace Anderson, Galashiels; 3, W. Lindsay, Galashiels; 4, A. T. Leslie, Selkirk. The work was on exhibition, together with the "prize panels" awarded at the national competition at Dundee last month, in the Burns Hall during the afternoon and evening. The annual business meeting of the association was held in the Douglas Hotel, Mr. T. C. Russel, Kelso, presiding. Ex-Bailie Laidlaw, Hawick, secretary of the association, read a satisfactory report. Office-bearers were elected for the ensuing year as follows:—President, Mr. H. M. Tait, Galashiels; vice-president, Mr. J. M. Bell, Galashiels; secretary and treasurer, ex-Bailie Laidlaw, Hawick. The next annual meeting and competition was fixed to be held at Galashiels.

**DUNDEE INSTITUTE OF ARCHITECTURE.**—"The Graphic Solutions of Problems in Architectural Dynamics" was the subject of a lecture delivered by Mr. John Y. Gray at this institute last week. Mr. J. J. Henderson presided. Mr. Gray said his purpose was to discuss certain frequently recurring problems of dynamics, and to show the solutions of these problems for architects. There was a feeling amongst young architects that they did not require such knowledge—that questions of mechanics might be left to the engineer. But the architect and the engineer were coming into close contact, so that a wider knowledge of the properties of materials was demanded of all who entered the architect's profession. Ignorance of such fundamental knowledge had in the past led to the erection of many hideous structures, and in many cases strength and stability, which could have been got by a skilful arrangement of the parts, had been supplied by massiveness and a lavish expenditure of material and labour. Every design of the architect was geometrical in its conception, and the structures were geometric forms. They could thus see at a glance how intimate the relations must be between statics and geometry, and geometry and architecture. There was no application of geometry that had proved more useful than its application to the problems of architecture. In all the structures of the engineer and architect the lines of force action might or might not be apparent; but they were in the structure, all the same. It was a problem of statics to show how these various lines of force could be located, and thus to present to the eye of the student a picture of the various forces that were brought to bear on the structure. The power to draw stress diagrams and interpret them might not confer the power of designing structures, but it would give help to those who would otherwise be helpless. It would help them to determine the effect of the slightest modification in the form of any structure, and enable them to compare the relative advantages of any two designs from the dynamical or stress point of view. Mr. Gray exhibited a number of drawings of roofs and bridges, and showed how the stress action could be worked out graphically.

**EDINBURGH ARCHITECTURAL SOCIETY.**—The opening lecture in connection with this society took place on the 1st inst. Mr. A. Lorne Campbell, the president, who occupied the chair, referred to the success of several of the members of the society in the recent competitions of the Royal Institute of British Architects, where no

fewer than four awards fell to the members of the society in open competition. These included the Pugin Scholarship to Mr. J. Hervey Rutherford, the Soane Medallion to Mr. W. A. Mellon, the Owen Jones travelling studentship to Mr. J. T. Stewart, and the third place in the Pugin competition to Mr. Ramsay Traquair. Mr. Forbes then delivered a lecture upon the "Abbeys in the Stewartry of Kirkcudbright," which was profusely illustrated by lime-light views.

**LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.**—A lecture on "British Plaster Work: its Past and Future," was delivered by Mr. G. P. Bankart, of Leicester, before this society on Monday evening. The lecturer said that plaster work was an art-craft of very ancient origin. In the 15th century, after having apparently lapsed, it came into practice again. Lime of best quality was chopped up, beaten with stick again, and subjected to three courses of preparation, ending with an admixture of marble dust to get the hardness and whiteness of the original stucco duro. The application of this was so far successful as to be greatly favoured by the Venetians and Mantuanis, from which the practice was handed on, via France, to England, whose monarch (Henry VIII.) imported workmen for the adornment of his house of "Nonsuch," now lost to sight. The Italian art thus introduced into this country soon gave way to a coarser style of work. In the place of figure drawing, an arrangement of panels appeared, with patterns of small area that would repeat with ease. The Fish Room at Audley End was a capital example of this Early English school. Subsequently the size of the subdivisions expanded, until it became the habit to divide ceilings into quarters. This ultimately led to the abandonment of the strict geometrical system. In executing the type of plaster work seen at Holyrood and other places, the design was drawn upon the ceiling, the stems and leaves employed being modelled *in situ*, with the details added as required. A company of gentlemen modellers was formed, who did much to preserve the best traditions of the art, which about the time of the Restoration acquired a new vitality. Later on, the art again declined, texture was lost, and instead of showing individual feeling, plaster craftsmen came to resemble so much machinery made for working purposes. Mr. Bankart's lecture was illustrated by a great variety of photographs and limelight pictures that testified to an early excellence in the art of plaster work that is apparently beyond the reach of to-day.

**SANITARY INSPECTORS' ASSOCIATION.**—The members of this Association held their sixteenth annual dinner at the Holborn Restaurant on Friday night. Sir John Hutton, in proposing the toast of the evening, "The Sanitary Inspectors' Association," said that, as to the status of sanitary inspectors, they had time out of mind recorded the fact that their appointments were of too precarious a nature to give confidence and comfort. At present a sanitary inspector was appointed for a single year only, and if he did his duty it was very likely he would soon be dismissed. There were cases on record in which the want of fixity of tenure had demoralised sanitary inspectors. They must educate the public until they brought about an alteration in that respect. In regard to remuneration, too, an improvement was necessary. It was absurd to think that an inspector could be properly remunerated by a pittance of £75 to £100 a year. A commencing salary of £150, rising by annual increments to £250, would be only a reasonable payment. Sanitary inspectors were the sanitary police, and as such they could not be bribed, and were worthy of their hire. Mr. T. J. Moss Flower, chairman of the council, having responded, the chairman presented, on behalf of the members, an illuminated address and timepiece to Mr. T. E. Dee in recognition of his occupancy of the chairmanship of the council during 1897-98; and an illuminated address and a handsome silver tea and coffee set to Mr. Edward Tidman, hon. secretary.

**YORK ARCHITECTURAL SOCIETY.**—The members of this society held their annual dinner at the White Swan Hotel, Pavement, York, on the night of the 28th ult. The chair was occupied by Mr. George Benson, A.R.I.B.A., President, and the vice-chairs by Mr. J. T. Pegge and Mr. A. W. Turner. Mr. A. B. Burleigh, hon. sec., proposed "The Royal Institute of British Architects and their Allied Centres." Mr. G. B. Bulmer, past president, in acknowledging the toast, alluded to the importance and the utility of the Royal Institute of Architects, and remarked

that those who had learned and studied their work properly should be protected from pirates and poachers. Mr. Councillor T. H. Storey gave "The York Architectural Society." The president, in responding, said the society had never been in such a strong or flourishing condition as it was at the present time, and it had a great future before it. Mr. W. Hepper proposed the concluding toast, "The Corporation of York, and Prosperity to the City." Mr. Councillor Proctor responded.

### CHIPS.

The Manhattan Elevated Railroad Company, New York, has decided to use electricity as its motive power, and to issue 18 million dollars more Stock for the purpose.

The King's Norton Board of Guardians have decided to erect tramp wards on the solitary cellular principle, providing accommodation for 24 males and 12 females, at an estimated cost of £4,800, on a site facing Oak Tree-lane, Sally Oak.

In accordance with instructions from the town council, Messrs. Kincaid, Waller, and Manville, electricians, of 29, Great George-street, Westminster, have drawn up a scheme for establishing electric-lighting works in combination with a dust destructor at Maidstone. The scheme is divided into two sections, the first dealing with the system best adapted for the supply of electric energy and the combustion of house refuse, and the second with the financial aspect of the undertaking. The capital outlay is estimated at £36,350.

A two-light stained-glass window has been erected in Park Church, Glasgow, by Messrs. Stephen, Adam, and Son, of that city, as a memorial. The figures represent Abraham and Jacob.

The pecuniary loss by the destruction by fire of St. James's Episcopalian Cathedral, Kingston, Ont., at the beginning of the year, is estimated at £15,000, of which only £5,000 is covered by insurance, while there was a debt of £6,000 on the old fabric. The walls can be utilised in the rebuilding, but many interesting historical relics have been destroyed.

The corporation of Croydon agreed, on Monday, to acquire 35 acres of Croyhamurst, at a cost of £1,000, subject to the approbation of the Charity Commissioners. This is about one-half of the estate at the disposal of the Whitgift Governors. In the event of the proposal being agreed to, a further £3,500 will be laid out in fencing, lodge-house, &c., but the acquisition of the whole of the Hurst, as is being advocated, will remain in abeyance.

The London County Council have given their consent to the formation of a new street, 50ft. wide, and nearly a quarter of a mile long, starting close to St. Paul's Schools at West Kensington, and terminating opposite the house of the late Sir E. Burne-Jones. The street will be known as Fitz-George-avenue, and will be occupied on both sides of its entire length by blocks of residential flats. The contract is being carried out by Mr. Henry Lovatt, from the designs of Mr. Delissa Joseph, F.R.I.B.A.

The thorough restoration of the parish church of Halling, Mid Kent, has just been completed at a cost of £2,500. The work has extended over 11 years, and has been carried out under the direction of Mr. Hubert Bensted, of Maidstone, architect. North and south aisles were added in 1888; in the following year a porch was erected, while in 1892 an organ-chamber and vestry were added. Last year the tower was taken in hand. The north-west buttress has been rebuilt to correspond with that at the south-west angle, as has also the parapet, leaving the steep pyramidal roof rising from within it. A lych-gate is still to be erected, and the dedication of this gift will take place on Easter Sunday.

The city council of Winchester have decided to invite competitive plans from selected architects for public baths, to be built at a cost of £6,000 or £7,000.

On Friday a meeting of the subscribers to the enlargement scheme in connection with St. Andrew's Church, Watford, was held to decide what work should be carried out, the tenders obtained from builders having exceeded the original estimates. Mr. W. Wallis Baldwin, the architect, attended, and submitted revised plans. Canon Baith said that some months ago they advertised for tenders—Messrs. Andrews, Brightman, Waterman, and Turner and Son, the other two being from Rugby and Chesham builders respectively. The result was that Mr. Brightman's was the lowest tender; it was for £4,528. The original estimate was for £2,500. The difference was accounted for by the rise in building materials, provision of oak stalls, and additional seats. It was decided to communicate with the subscribers.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—I. M. O.—T. P.—S. T. G. and Son.—S. W.—W. K. L. (Bromley).—R. N. C. and Co.

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Tokio," "Casual," "Arc," "McGalligan," "Espoir," "Angler," "Swan," "Cantab," "Notts," "Butts," "Scruton," "Grip," "Quadrant," "Thistle," "First Attempt," "Pup," "Astragal," "Philomel," "Sphinx," "Quercus," "The Old Firm," "Balbus," "Claude," "Vulcan."

## Correspondence.

## WALSOKEN CHURCH.

To the Editor of the BUILDING NEWS

SIR,—I am afraid my anxiety to represent the quaint character of the Gothic lettering on the Walsoken font only led to the mystifying of the compositors. Perhaps you could find room for the correct inscription, which runs as follows:—

ANNO. DNI . MILL. QUIG. INTE. QUA.  
DEGE. QRTO.

Each word, or portion of a word, occurring between shields on which are the Implements of the Passion. The inscription on the stem when extended reads:—"Remember ye souls of S. Honiter and Margaret his wife, and John Beforth Chaplain."—I am, &c.,

A. NEEDHAM WILSON, A.R.I.B.A.  
Marlborough, Feb. 4.

## THE KENSINGTON VESTRY AND DISTRICT SURVEYORS.

SIR,—Not having an opportunity on Thursday last at the Surveyors' Institution of speaking to Mr. Weaver's paper, I may perhaps be allowed in the pages of your journal to make one or two observations upon it.

It is generally considered necessary when you propose doing away with a long-established system to first of all show its defects, and secondly to show the merits of that which you propose to substitute. Mr. Weaver, I consider, has done neither.

The offices of district surveyor and parish surveyor exist for the benefit of the public, and not for the benefit of either official. The public do not care twopence whether the changes you propose making "raise the status of the official" or dignify the position of the chairman or the vestry by giving him a gold chain and calling him mayor. They will ask, and rightly ask, Is the work to be better done, and are we going to get more for our money?

Mr. Weaver has endeavoured to show by innuendo and insinuation that district surveyors are not above suspicion. Taking it upon his own ground, what defects and breaches of the law has he shown? None except from his own side of the house when he states that "unauthorised alterations to drains are sometimes made," and these in spite of the whole army of sanitary inspectors under his control. Therefore, what is going to happen when the control of building is under the vestry?

I had the honour to be district surveyor for a portion of the parish of Kensington from 1885 to 1891, and during the whole of that time I may have seen Mr. Weaver half a dozen times, and I venture to say I knew as much about Mr. Weaver's duties as he did about mine, and that was nothing, and yet Mr. Weaver comes forward as the champion of the vestries against district surveyors, of whose duties he must necessarily be ignorant, and suggests that his proposals are in the public interest.

The difference between a district surveyor and parish surveyor, with advantage to the former, is: one acts under orders and the other acts on his own initiative. There is a good deal in the paper about I was ordered by my board to do this and that, and one is tempted to ask the question whether the whole paper is not the result of an order of the board, and judging by the large contingent of Kensington vestrymen who turned up at the paper, and told us their age and how long they had been members, and what a nice place Kensington was, one would almost have thought that it was a small party of Kensington vestrymen having an evening out at the Surveyors' Institution.

This question is one for the building public, and not for vestrymen. Under the present system a builder has to give notice to the district surveyor, and two days afterwards he can start with his work, and the district surveyor keeps a watchful eye upon it to see the building rules are observed.

Under the new system nothing can be done till plans are submitted and approved. This means first going before a committee, where the plans are handed round the table, most of the members looking at them upside down. A report of the surveyor is required, the plans have to go back to the committee, then before the full board, and when they arrive there a particular breezy time may happen over some minor detail of the board, and the whole report may be shunted till the next meeting, causing delay to the builder and building owner, which also means loss of money.

This is a matter in which professional men, architects, and surveyors will want a word. Architects and surveyors in the provinces are groaning under this intolerable system of submitting plans, and desire to be under some such system as prevails in London, and were London to adopt the provincial system it would mean retrogression.

District surveyors have to thank Mr. Weaver for the patronising care he states in his paper he has taken to safeguard their interests in view of the proposed change. I can assure him that while we fully appreciate it, we are quite capable of taking care of ourselves and looking after our own interest, and if he had taken as much pains to have collected a few facts instead of opinions, the paper would never have been written at all.

In conclusion, glorify your parish surveyor into a full-blown borough engineer if you will; glorify your chairman of vestry into a lord mayor with a gold chain; but leave your district surveyors in the position in which Parliament has placed them, and which it has again and again confirmed, that they may carry out their duties in the future as they have done in the past, without fear or favour.—I am, &c.,

244, Camberwell-road. ELLIS MARSLAND.

## MODEL SPECIFICATIONS—COPPER ELECTRO-GLAZING.

SIR,—May we call attention to the "Model Specifications.—I." of Feb. 3, and invite investigation into the merits of copper electro-glazing to supersede leaded glazing for door-panels, casement lights, and leaded lights to shop-fronts?

Sections 4, 7, 8, 9, 10, 12, 13, and 14 can all be supplied with the products of the British Luxfer Prism Syndicate in a manner indisputably acceptable as regards workmanship and efficiency. Copper electro-glazing needs no saddle-bars. Plates thus welded are immensely strong, and will resist even fire. If the upper sashes of office windows are glazed with Luxfer prismatic window glass, and the lower sashes with British plate copper electro-glazed, you will have greatly increased daylight as well as a fireproof window.

May we ask that you correct section 13, mentioning the British Luxfer Prism Syndicate's lights instead of our agents, Hayward Bros. and Eckstein?—We are, &c.,

THE BRITISH LUXFER PRISM SYNDICATE, LTD.

## CHIPS.

The Passmore Edwards Public Library, in Borough-road, Southwark, was opened on Wednesday by Mr. J. Bryce, M.P. Mr. A. Hawkins, the chairman of the Library Commissioners, who presided, mentioned that Mr. J. Passmore Edwards had contributed £5,000 towards the cost. The architects were the late Mr. C. J. Phipps and Mr. A. Blomfield Jackson, of Mecklenburg-square, W.C., and the builders, Messrs. J. Smith and Sons, Norwood Junction. We illustrated the building in our issue of December 3, 1897.

The parochial committee of Chipping Sodbury have asked Mr. W. L. Le Maitre to give his opinion on the bacteria system, to be carried out on the lines suggested by Mr. J. D. B. Trenfield.

Branch Stores, under the control of the Winnington Co-operative Society, were opened at Barnton, near Northwich, on Saturday. The buildings have been erected by Mr. Thomas Leicester, builder, of Witton-street, Northwich, from designs by Mr. Wm. Munford, architect, of 33, Guildhall, Preston, and Mr. W. I. Dalzell, of Winnington, has been clerk of works.

A new Palace of Varieties is to be erected on the site of the existing Theatre Royal, at Kilburn, and the adjoining properties. The building will be without columns, and an uninterrupted view of the stage will be given from all parts of the auditorium, and will accommodate 1,500. The style adopted by the architects, Messrs. Palgrave and Co., Victoria-street, S.W., is a free rendering of French renaissance, while the exterior principal front will be in glazed terracotta Faience work, by Burmantofts, Ltd. The estimated cost is about £30,000, apart from the various properties to be acquired. It is expected the new building will be ready for opening in the late autumn. Messrs. Wyson and Long are acting as consulting architects.

Mr. Walter A. Ducat, an inspector of the Local Government Board, held an inquiry at Salcombe Regis, on Friday, concerning the application of the rural district council of Honiton for sanction to borrow the sum of £1,300 for works of sewerage at Salcombe Regis, and for the connection of sewers in that parish with the sewers of the urban district council of Sidmouth.

Messrs. Fambrini and Daniels, architectural concrete workers, Lincoln, have just completed jobs in London, Guildford, and Fenton, and have now in hand contracts for their material for the Coach and Horses Hotel, St. John's-square, London; fireproof arcading, comprising upwards of one hundred arches, with perforated spandrels and dados, and modelled and panelled pillars, moulded rails, &c., for Messrs. Walsh's drapery establishment, Sheffield; residences, Ramsey and Grimsby; warehouses for Messrs. Heelas and Co., Ltd., Reading; and the Head Quarters, St. Mary's Butts, also in Reading, from designs by the same architect, Mr. Fred W. Albury, of the same town. The front of the last-mentioned building is entirely in Messrs. Fambrini and Daniels' coloured concretes; the string-courses, cornices, bay windows, &c., being in buff, and the heavily-moulded bases, corbels, and arch in bluish-grey concrete. The pilasters and remainder of the front and chimney-stacks are in red concrete-bonded facing blocks. Some of the pilasters are 2ft. 4in. by 2ft. in solid concrete, and the grey double-moulded arch one solid piece, and weighing, with arched angle irons imbedded, nearly two tons. To cope with their increasing trade, this firm are again extending their works, and are now building shops to enable about 400 superficial feet of additional benches to be laid down, together with improved appliances for lifting heavy weights, by means of flush-rings embedded without injury to moulded surfaces.

## Intercommunication.

### QUESTIONS.

[12176].—**Wet Over Shop.**—Can any reader say what is best to be done to stop wet coming in over shop-front under the following circumstances?—The wall above shop-front is 11in. hollow, and the front is constructed as sketch. The wet drives through outer 4in.

wall, and runs down on the inside of hollow. There is lead put to intercept it in the usual way, but it fails to answer the purpose, as wet drops into the shop in large quantities!—PUZZLED.

[12177].—**Area of Brick Piers.**—Will some reader kindly inform me of a simple rule for calculating the area of brick piers in factories, &c., according to the weight per ton? The bricks to be Leicestershire, laid in mortar.—J. W. S.

[12178].—**Damp.**—Can anyone tell me of an effective and invisible solution for prevention of damp in an old brick wall, and the approximate cost per yard?—J. W. S.

[12179].—**Flooring.**—I notice in a building just erected in this district, that the floors are made of 9in. planks on edge, laid across the main beams without cross supports, and nailed one to another through the sides. The owners of the property state that the insurance premium has been reduced considerably owing to this, as it is practically indestructible by fire. The cost is very little over the ordinary method, and makes a firmer support for the heavy finishing machinery that is used, lessening the vibration, which entails great wear on the running parts. They estimate that the saving, apart from the reduction in premium, will be considerable. Could any of your readers give their opinion on this?—F. W. SHAW, Hebden Bridge.

[12180].—**Brickwork.**—In measuring labour to brickwork, is it not correct to measure two of the outside walls from A to B, and then take the return and cross

walls from C to D? And is not all rough cutting included in the price per rod?—INQUIRER.

[12181].—**Gas-Fires: Are They Healthful?**—Will someone who knows tell me which is the best kind of fire and burner to use? Also, whether a gas-fire is healthful or not? Many people I know have discarded them for the coal-fire. Are those which are made to protect in a stove with pipe to carry off the products of combustion or fumes, better than the ordinary grate filled with asbestos? Is there any saving in cost of fuel?—IN DOUBT.

[12182].—**Preserving Wood.**—Which is the best means of preserving wood? And, can it be applied to bond timber wallplates, wood bricks, joists, &c., without much trouble or cost?—J. J. S.

[12183].—**Painting Plaster Walls.**—The walls of a stuccoed house facing south are continually damp, and the inside papering is spoilt in places. Can any reader recommend an inexpensive cure? Will a coat or two of oil paint be desirable? or, are the walls too damp for pointing? Answer will oblige.—A. B.

[12184].—**Foundations.**—Describe the circumstances

under which risks of accidents may arise due to interference with foundations after they have been put in? What manifestations in a building could lead one to infer that such interference was going on? I also wish to know of a good book dealing with the construction of large buildings near the river Thames, and also some particulars as to the soil and tides, with the latest and most general way of dealing with such sites.—STUDENT.

### REPLIES.

[12157].—**Baths.**—In further reply to "Amateur Builder," I am of opinion that neither enamelled copper nor porcelain baths can claim many advantages over the other as regards cleanliness, and I do not think, provided you have a good quality copper bath, that any trouble will be experienced in the enamel chipping off. Of course, this is assuming the bath is subjected to fair wear and tear only.—TREBLA.

[12157].—**Baths.**—Enamelled copper baths are as clean as any, and are cheaper than porcelain ones. The enamel wears off in time, but a good bath should stand a lot of use.—LOUIS ERWOLD.

[12167].—**Monkey-Puzzle Tree.**—The Chili pine or Araucaria imbricata, grown here for its ornamental character. There is one at Dropmore, 70ft. high. It prefers light soil and with plenty of air, but suffers from a temperature of five or more degrees of frost. The wood is hard in its native country, and probably convertible into timber for many purposes; but whether so when grown here has to be proved. Dr. Brown, in the *Forester* (1894), has two or three pages on it, but leaves its economic use for further data. A timber expert might approximate its value.—REGENT'S PARK.

[12167].—**Monkey-Puzzle Tree.**—The wood can be used for cabinet-making purposes, but its worth can only be told on inspection.—LOUIS ERWOLD.

[12168].—**Vestry Authority.**—Procure a copy of the by-laws relating to buildings, and you will then see how far the vestry have control over your buildings.—L. E.

[12168].—**Vestry Authority.**—Yes; the vestry have power to order you to produce plans as regards drainage. The powers given to the vestries and district boards of London are conferred by the Metropolitan Local Management Act, 1855, and as regards sanitary matters, by the Public Health (London) Act, 1891, &c. These powers enable vestries to inspect and examine, in the case of new houses, &c., as to underground rooms, closets, water supply, to abate nuisances, &c.—SANITARY.

[12169].—**Boundary Fences.**—I have no doubt the owner of the field has a right of ownership over the fence in question. "Indignant" can only protest, but I do not think he can prevent the owner raising his fence. If the posts and rails were on the side of the tenant, it is certain that he was the owner, and he can raise his fence to protect his land.—G. H. G.

[12171].—**Shoring Buildings.**—A chapter on shoring buildings is given in Mr. Mitchell's "Advanced Course of Building Construction"; it is also referred to in your "Notes on Building Construction." There is also a small treatise published by C. H. Stock on "Shoring and Underpinning."—G. H. G.

[12171].—**Shoring Buildings.**—"Shoring and Underpinning," by Stocks, is the best work on the subject. It is published by Batsford, 94, High Holborn.—L. E.

[12172].—**Wood-Block Flooring.**—These are laid on mastic, which securely holds the blocks down. The only preventive against shrinkage is to have thoroughly seasoned wood.—L. E.

[12172].—**Wood-Block Floor.**—In a very extensive experience I have found Ebner's patent hydrofuge system the best, the blocks being securely keyed into the foundation, as well as to each other, by means of iron channels and hard-setting asphalt; there is, therefore, no chance of the blocks springing, warping, or twisting out of a true surface.—ARCHITECT.

[12174].—**Casement Fixing.**—Lugs are generally made in the frames of casement. These are built into the brickwork. For stone mullions and jambs, the frames are screwed to dovetailed blocks of wood.—ALPHA.

[12175].—**Right of Light to Rebuild Premises.**—Particular windows in a dominant tenement, if rebuilt, must be in the same position or place as those of the old building. (See the case of "Tapling v. Jones.") If in the rebuilt premises the windows are not in the same place, the servient tenant might raise an obstruction and obscure the light. Clear evidence must be given, if required, of the similarity of position of the old and new windows, hence it is necessary that before an old building with ancient lights is pulled down, the owner should have measured elevations made, showing the position and size of the windows, so that they may be rebuilt in the same position (see "Fowler v. Walker"). Of course it is necessary that "Q. E. D." has an acquired right to the light, and that he rebuilt before the transpiration of twenty years, and the right may be prevented by the owner of servient tenement raising an erection to obstruct light before it has been enjoyed for that period.—G. H. G.

A portrait of the Bishop of Exeter, painted by Mr. Cope, A.R.A., has been presented to him by friends. The portrait will hang as an heirloom in the palace, beside that of his predecessor, the present Archbishop of Canterbury. A replica is also to be given to Mrs. Bickersteth.

In the parish church of Coddensham, Suffolk, there has been dedicated a new reredos, carved in oak with panels in high relief. The subjects represented are—on the left the three Marys at the tomb, and on the right the descent of our Blessed Lord from the Cross. Iron cranes with curtains hanging therefrom are fixed on either side. Messrs. Percy Bacon, of Newman-street, W., are the architects.

### STATUES, MEMORIALS, &c.

FORFAR.—The statue which has been erected to the memory of Provost Reid in Castle-street, Forfar, was unveiled on Saturday. The statue, which faces Corporation Chambers, stands 13ft. high. The pedestal is of granite, 8ft. in height, and the figure, which shows the late provost seated in a chair, is life and a quarter in size. The sculptor is Mr. George Webster, Edinburgh. The bronze was cast by Messrs. J. W. Singer and Son, Frome. The statue was set up by Mr. James Maclean, builder, of Forfar, under the direction of Mr. Webster.

### WATER SUPPLY AND SANITARY MATTERS.

TEIGNMOUTH.—The waterworks were opened on Tuesday, after extensive alterations and improvements. Hitherto the town has been dependant on Mylor Wells without the assistance of an efficient storage reservoir. A scheme has been formulated by the surveyor to the Urban District Council (Mr. Chris. Jones), and has now been completed. The works comprised the covering in of the Hazeldown and Lansdown reservoirs, with the reconstruction of the former, and the laying of new mains, &c., with Deacon's waste water system. The most important of these works is that of Hazeldown reservoir, which, not being watertight, has been unused for thirty years. Covering  $\frac{3}{4}$ -acre of ground, this reservoir has been rebuilt and covered at a cost of £6,815, the contractor being Mr. A. H. Slocombe, of Teignmouth, the Lansdown reservoir having been covered in by Mr. J. Fisher, of Plymouth, at an expenditure of £782, or a saving of £113. Other contracts are with Mr. W. J. Burden, £525 10s., and Messrs. Hawkins and Best, £140 10s. The new storage reservoirs, capable of containing 2,600,000 gallons, provide for a month's consumption in case of failure at the wells. The water is obtained in the first place by pumping at Mylor Wells. It has to be lifted 400ft. for half a mile to Hazeldown, which supplies the higher levels. In the construction of the reservoirs, bricks are laid on the clay, with concrete above, and concrete walls and roof, supported by fifty iron columns. The wells are supplemented by the Haldon springs and the Coombe brook.

### CHIPS.

We understand that the permanent additions now being made to the Nottingham City Asylum, Mapperley, are being warmed and ventilated on the Ashwell-Nesbit system.

The sales at the Tokenhouse-yard Mart during the past week were unimportant in character and the supply short. Property, however, sold well, and the demand was keen. The properties on offer during the week were only of the ordinary type or small ground-rents, the majority of which found purchasers, the total being £50,587, or over £17,000 increase on the corresponding week in last year, when £33,478 was recorded.

In the case of the application of David Miles, of Bexhill, builder, the order of discharge from bankruptcy has been suspended for one month ended Feb. 9.

The first rod of a new parcels office for Plymouth was cut last week. The site adjoins North-road station, facing St. Michael's terrace, and the building, which will be triangular, will be erected by Messrs. A. R. Lethbridge and Son, of Plymouth, who have taken the contract at about £2,000.

The new block of Admiralty buildings now being erected in Whitehall at a cost of nearly £200,000 will probably be ready for occupation by about the end of the year. There are about 300 men engaged upon it.

At a meeting of the members of the Birmingham Clerks of Works and Builders' Foremen's Association, held at the Midland Institute on Wednesday evening week, Mr. W. H. Whitehouse, A.I.E.E., gave a lecture on "Electrical Work in Connection with Buildings," with diagrams showing the latest methods of fixing the wires for the distribution of electrical power over large areas. There were also on view several cases of appliances used in the work, lent by some of the principal makers in the kingdom.

The death took place on Wednesday week of Mr. Bernard Massey, of the Mona Hotel, at Penmaen-mawr, and formerly of Stafford. The deceased was born in 1838 at Newport, Salop, and was educated at the Grammar School. He went to Stafford in his early youth, and afterwards became resident waterworks engineer, having charge of the boring operations at the Common, under the direction of Mr. Dennis, chief engineer. He was captain of the Fire Brigade. In 1880 he was appointed surveyor to the Penmaenmawr Local Authority, and held that post till 1885, when he resigned and was elected a member of the board, continuing in that capacity until March last.

## Our Office Table.

THE Royal Institute of British Architects have done well to award the Royal Gold Medal to so distinguished an architect as Mr. G. F. Bodley, A.R.A. Few, if any, have done more towards the elevation of architecture as a fine art in this country during the latter half of the 19th century than Mr. Bodley. No one familiar with his works can have failed to realise the beauty of their detail and the originality which marks their conception; whether in some obscure country village church or in a great cathedral, they all bear the stamp of a designer whose aim has been concentrated on perfection. We need not attempt to give in this place a list of the works of the new Royal Gold Medallist. As a pupil of Sir Gilbert Scott, his earlier designs were associated with the practice of his master during the hey-day of the original Gothic revival, and not a few of Scott's best designs were worked out in detail by Mr. Bodley—for instance, the spire at Ealing Broadway. The pupil, however, though ever loyal to his leader, soon broke away from the traditions of Spring Gardens, and, like his fellow worker George Edmund Street, sought inspiration from the Early French Mediaevalists. The original church of St. Michael at Brighton, with its plate tracery and banded brickwork, is an instance of Mr. Bodley's design at this time during the sixties. Among the originators of the return to the spirit of the Renaissance in modern architectural design in this country, Mr. Bodley's original offices for the London School Board, erected in the early seventies, need only to be mentioned, for they have found more than one imitator since. Mr. Bodley, however, will best be known for his designs in Ecclesiastical art wrought in the Later phases of our National Gothic architecture. In conjunction with Mr. Thomas Garner, he designed the great marble reredos at St. Paul's.

THE Housing of the Working Classes Committee of the London County Council have issued a return showing the receipts and expenditure to the end of the year 1897-98 in respect of all workmen's dwellings and model lodging-houses erected or owned by the Council. The return gives two tables, the first of which shows the financial result up to the end of the year of the dwellings and lodging-houses erected on sites upon which the Council elected to build. In this table eight schemes are dealt with, which involved a capital expenditure up to the end of March last of £309,567. Upon two of the schemes only is any net deficiency shown. In the case of the Goldsmith's-row building (Shoreditch) there has for the last year been a deficiency of £48, absorbing the previous surplus on the buildings, and leaving a net deficiency of about £4. On the Dufferin-street costermongers' dwellings there is a deficiency for the year of £27, which, added to previous losses, makes a net deficiency of £215. On the Boundary-street scheme the total surplus amounts to £1,306. The Brooks Market scheme (Holborn) shows a surplus of £67. Deficiencies are exhibited on the accounts of the schemes at Cable-street (Shadwell) and Shelton-street (Drury-lane); but the deficiencies are more than counterbalanced by previous surpluses. The Parker-street lodging-house again shows a surplus of £149, and the Green-street and Gun-street (Southwark) scheme a surplus of £252. The financial position of the eight schemes at the end of the year gave a surplus of £2,154. The second table deals with schemes upon sites upon which the Council had no option but to build, as no purchasers could be found for the land. This table includes five schemes, two under the Housing of the Working Classes Act, 1890, and the others under the Thames Tunnel (Blackwall) Acts, 1887 and 1888. Each of them exhibits a deficiency, the total loss to the end of the year being £4,965. The largest deficiencies are in the Hughes-street (Deptford) scheme, amounting to £2,232, and on the West-view cottages (East Greenwich), aggregating £1,606.

A LECTURE on "Some Great Mediaeval Churches and their Construction" was delivered at Edinburgh before the East of Scotland Engineering Association on Friday night by Mr. H. F. Kerr, A.R.I.B.A. The lecturer said the great churches of Mediaeval times had been admired both by the practical and the artistic mind. The former had room to ponder the scientific skill with which these early builders covered vast spaces with

great vaults, the whole supported on a minimum of solid piers; the artist revelled in the equally marvellous manner in which every constructional item was treated so as to fully satisfy the imagination, the result being universal admiration and respect. The division of these churches, almost invariably cruciform in plan, into nave and aisles covered with vaults was fully entered into, and the difficulties met with in early vaults of barrel pattern, and the solutions of these were pointed out. The aim of the early builders was to light the nave by windows above the great arcade and beneath the stone ceiling without rendering precarious the stability of the fabric. The development to this end was traced from barrel vault, through groined vault to rib vault and pointed vault. The construction, the features, and the decoration of these buildings were fully indicated by chronological diagrams and views. The buildings illustrated included Durham, Peterborough, Salisbury, Canterbury, and Lincoln Cathedrals, while the foreign examples embraced the Saint Chapelle, Paris, and Amiens Cathedral. The latest development of vaults in England—the fan vault—was exemplified by views and diagrams of the ceiling of Henry VII.'s Chapel, Westminster Abbey, and the cloisters of Gloucester Cathedral.

THE eight London water companies have introduced a Bill this session to facilitate inter-communication between their respective works and mains, with a view of obviating the possibility of a deficiency in times of drought or accident. The Bill provides that the Metropolitan water companies shall, within six months after the passing of the Act, submit a scheme to the Local Government Board for effecting junctions between the works of any two or more of the companies, and the Board may, after considering the scheme, order such works to be executed as they may think fit. In the event of no scheme being submitted by the companies, the Local Government Board are empowered to appoint an arbitrator who shall state to the Board the works he considers necessary to provide for effective inter-communication between the works of the companies. Provision is made in the Bill to enable the Local Government Board to enforce their orders against the companies, and power is also given to the Board to authorise the companies to raise money for the execution of the works, provided that the expenditure shall not exceed the sum of £600,000, without the further authority of Parliament.

A MEMORIAL has been presented to the Government urging them to deal with the registration of plumbers in the ensuing Session in the interests of the public health. It is signed by over sixty members of Parliament, including Mr. J. Aird, Sir Henry Bismore, Lord Hugh Cecil, Sir W. Hart Dyke, Sir H. S. King, and the Marquis of Lorne. The memorial suggests that statutory provisions should be made to secure the adequate qualification, certification, and registration of plumbers, on whose work the healthiness of a house virtually depends. This requirement is the more urgent in view of the aggregation of town populations rendering the work of the plumber more difficult, and consequently requiring that plumbers should be more efficiently trained in the art of plumbing, and should possess such knowledge of sanitary appliances as to prevent contamination of water and air by emanations from drains and sewers. A separate memorial has been addressed to the Local Government Board signed on behalf of the Parliamentary Bills Committee of the British Medical Association, the Manchester and Salford Sanitary Association, the Royal Institute of British Architects, the National Health Society, and the Royal Institute of Public Health.

THE "Roman Defences of South-East Britain" formed the subject of a lecture delivered at the Royal Institution on Friday by Mr. Victor Horsley. Sir Henry Thompson occupied the chair. The lecturer said that the many camps on the south-east coast which were mentioned in Antonine's itinerary were probably built on the sites of earlier camps. The masonry of the British castra was not like that found at Pompeii. The walls were constructed not of great square blocks of stone, but with irregular masses of tiles at intervals. This structure was especially difficult to destroy. There were no remains showing whether the walls were battlemented at the top, but this was probably the case. It was a curious fact that in so many of the south-eastern camps of Britain one of the walls was apparently missing;

but traces of the missing portion had been found in every case except, until recently, Lympne, and now his excavations had enabled the author to trace the missing portion of that camp. There was nothing to settle definitely the interesting question of how the last relics of Roman empire were extinguished in Britain. Some light was thrown on the point, however, by a 12th-century record of the sack of the Pevensey settlement, by the fact that the remains of Roman villas generally showed traces of fire, and by an interesting discovery which had just been made near Cardiff. Excavations there had exposed the richly tessellated floor of a Roman building, marked with horses' hoofs and heaped with human skeletons. Three shallow graves had been dug in the floor, and in these were found skeletons of a men of a larger build—probably of the invaders.

In opening the Corporation Art Exhibition at Oldham on Monday, Mr. Alfred Parsons, A.R.A., remarked that one of the most encouraging facts of our time was the more widely diffused love of pictures, of scenery, of flowers. In discussing the progress of landscape painting in England, Mr. Parsons said that poets had always been ahead of painters in expressing, if not in feeling, the charm of light and trees and flowers; but it had been reserved for our own times to try to render with any realism the wayside objects which the poets loved and wrote about two centuries ago, and now we had painters who not only tried to give the beauty of the hedgerow, but also to show that there was nothing on which the light of heaven fell which was altogether hideous. There were two great possibilities in art—to glorify the seen and to suggest the unseen. Realism and Romanticism—these were the two camps into which the art of to-day was divided. Each had its truths and its fallacies, its merits and failings, and they might learn something by comparing the claims of both parties, for though there was no compromise possible between the leaders of the schools, still less for the followers, yet the dispassionate lovers of art might arrive at seeing good in both.

The old house, No. 7, Johnson's-court, Fleet-street, in which Dr. Johnson lived in the year 1766, and for some years afterwards, is shortly to be pulled down to make way for an extension of Anderton's Hotel.

A stained-glass window has been placed in the parish church of Stibington; the subjects are Faith and Hope. The work has been carried out by Messrs. Jones and Willis, of London and Birmingham.

The parish church of Harpenden was reopened last week after the addition of a north aisle and the recasting and rehanging of the bells. Mr. J. R. Brown and Son, of Harpenden, were the architects, and Mr. G. Dunbar, of Luton, was the builder.

On Thursday in last week, Colonel Hepper, a Local Government Board inspector, held an inquiry into the proposal of the Melksham Urban District Council to borrow £1,000 for works of street improvement.

In consequence of a complaint made by Mr. Algernon Ashton in December last about the neglected state of Joanna Baillie's tomb in Hampstead Churchyard, the grave has just been renovated. The inscription on the top of the tomb now indicates in clearly-cut black letters that the famous poetess lies interred with her mother, Dorothea Baillie, and her sister, Agnes Baillie, the last-named lady dying in her 101st year.

Colonel Hepper, Local Government Board inspector, held an inquiry at Bath on Friday to approve or reject a scheme by the authority for erecting 40 artisans' dwellings in the Dolemeads. It was explained that they would be raised above the level of the highest flood recorded, while roadways leading to them would be widened; 12 old houses would be demolished, and 17 others had been pulled down to carry out an improvement on the river side. Dr. W. H. Symons, medical officer of health, approved the site.

The committee of the proposed new Wesleyan chapel in Darlington-street, Wolverhampton, to be erected on the site of the present edifice, have selected the plans of Mr. Arthur Marshall, of Nottingham, who is also the architect for the new workhouse in that town. The sitting accommodation will be kept at 1,250, and the style will be Italian. The total cost is £29,000, of which £6,550 is already promised.

Sanction has been given by the Local Government Board to the electric power and lighting committee of the Liverpool Corporation to borrow £44,000 for the purposes of electric lighting.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Clerks of Works' Association. Annual Dinner. King's Hall, Holborn Restaurant. 6.30 p.m.

Carpenters' Hall Free Lectures, "Building an Underground Railway," by Basil Mott. 8 p.m.

Bristol Society of Architects. "Marble Decoration," by Arthur Lee.

TUESDAY.—Institution of Civil Engineers. "The Lake Superior Iron Ore Mine," by Jeremiah

Auctioneers' Institute. "Ejectment of Tenants Without Legal Process," by Edward J. Vaughan, Barrister. 8 p.m.

Perth Architectural Association. "The Progress of Sanitary Science," by William Watson, of Perth.

WEDNESDAY.—Society of Arts. "The Balloon as an Instrument of Scientific Research," by the Rev. John M. Bacon. 8 p.m.

FRIDAY.—Architectural Association. "Colour Decoration," by Cole A. Adams, F.R.I.B.A. 7.30 p.m.

Glasgow Architectural Craftsmen's Society. "Notes on Building Materials," by R. W. Horn and Alex. Davie. 8 p.m.

## THE ARCHITECTURAL ASSOCIATION.

FEBRUARY 17th.—ORDINARY MEETING, 9, Conduit-street, 7.30 p.m. Mr. COLE A. ADAMS on "COLOUR DECORATION."

FEBRUARY 18th.—VISIT to the ROMAN CATHOLIC CATHEDRAL, Ashley-gardens, Victoria-street, Westminster (Mr. J. F. Bentley, Architect). Meet at the building at Three p.m.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

## The Society of Architects.

Founded 1884. Incorporated 1893.

THE SOCIETY OF ARCHITECTS, St. James's Hall, Piccadilly, W., will hold an EXAMINATION in Architecture and Construction on APRIL 12th, 13th, and 14th, 1899, in the following subjects:

Section I.—ARCHITECTURE. Subject (a), Planning and Design. Subject (b), Architectural History.

Section II.—BUILDING CONSTRUCTION and MATERIALS. Subject (a), Construction. Subject (b), Materials.

Section III.—PRACTICE. Subject (a), Specifications. Subject (b), Measurements and Valuation. Subject (c), Contracts.

Section IV.—SANITARY SCIENCE.

The latest date for entering for the Examination is March 23rd, 1899. Syllabus free. Copies of the last Examination Papers, one shilling.

To that Candidate who shall pass the Highest Examination, the GOLD MEDAL of the Society will be presented, a SILVER MEDAL to the second in merit, and BRONZE MEDALS for special excellence.

ELLIS MARSLAND Hon. Sec.

C. McARTHUR BUTLER, Sec.

On Monday, at North London Police-court, before Mr. E. S. Fordham, four carmen, named Alfred and Edward John Parker and Thomas and Alfred Rose, were charged with stealing bricks, and a contractor and builder named Charles Croome, of Laurel Cottages, Eden-grove, Holloway, was alleged to have feloniously received them. The prisoners were all committed for trial, bail being allowed.

At the Guildhall, Bath, on Friday, Col. A. J. Hepper, R.E., Local Government Board Inspector, held an inquiry concerning the application from the town council for powers with respect to the proposed erection of a hotel, and public improvement in Orange-grove. They applied for a loan of £10,000 to make a roadway from the Grove to Newmarket-row; to be allowed to grant to Mr. Holland a lease for 99 years of the old slaughter-house site for the construction of the hotel; and for compulsory powers to purchase any property needed to be pulled down.

The memorial to the late Baron Pollock will take the form of a brass in raised letters, placed on the north wall of the church of St. John's, Putney, of which the late judge was warden for over fourteen years. Messrs. Barkentin and Krall, of Regent-street, W., are carrying out the work.

The foundation-stone of the Martin memorial clock tower, to be erected in the market place at Wainfleet, was laid on Thursday in last week.

The Suffolk County Lunatic Asylum, at Melton, near Woodbridge, is about to be enlarged at an estimated cost of over £42,000, from plans by Mr. A. J. Wood, of Surrey-street, Strand.

The first section of new board schools in Harrington-street, Pear Tree, Darby, was opened last week. The block accommodates 420 infants and 500 junior mixed children, and will eventually form part of a school for 1,800 children. It is two stories in height, with heating-chamber in the basement, and is planned with a large hall on each floor in the centre, with classrooms opening directly out of it, being a combination of the central hall and corridor systems. The staircases are of stone, and the floors of fireproof construction. The classroom and central-hall floors are of pitch-pine, secured directly to the concrete, and the corridors and hat places are laid with glass mosaic. Externally, the buildings are of brick with terracotta dressings, and Hopton stone sills and steps. The roofs are covered with slate. The cost has been £12 10s. per head, including offices for the complete school.

## Trade News.

## WAGES MOVEMENTS.

ABERDEEN.—The plumbers have made an application to the masters for an increase of 1d. per hour in their wages. The present rate is 7½d., and in some cases 8d. and 8½d. is paid. The masters have resolved not to concede the demand. The employers have, however, resolved to offer the operatives the terms proposed by Lord Provost Fleming as a basis of settlement of the strike—namely, ½d. of an increase on April 1, and another ½d. six months later.

THE PLASTERERS' STRIKE.—The result of the ballot of the London branch of the Plasterers' Operative Union on the question whether the resolution compelling managing foremen to become ordinary members of the Union should be rescinded or not is, that by a large majority the men have decided to withdraw the resolution. The men only voted on this question. The other matters of dispute, which the Master Builders' Association have raised, have not yet been placed before the men. It is understood that the masters require an undertaking from the Union that in future they will desist from the practice of blacklisting certain firms, and of refusing to allow their men to work with non-unionists, and further that they will not restrict the number of apprentices which any one firm may employ. In regard to these demands, the leaders of the men state that the Union would certainly not give way on any one of them.

## CHIPS.

The Marchioness of Granby will unveil the panel, "The Fire of London," painted by Mr. Stanhope Forbes, A.R.A., and contributed by the Sun Fire Office, at the Royal Exchange, on Thursday next, the 16th inst.

At Monday's meeting of the Okehampton Town Council a letter was read from Mr. Harry Geen, C.C., notifying that he had decided to sever his official connection with the council as borough surveyor and sanitary inspector. During his 13 years' work for the borough he had always taken pleasure in advancing its best interests, and in doing all in his power to secure every advantage for it. The resignation was accepted with great regret.

With regard to the Coolgardie water-pipe contract, Messrs. W. S. Vellinghausen and Co. have received an order for 32,000 tons of steel plates, which they have placed with four German rolling mills, the total being about £240,000.

The London County Council accepted on Tuesday an offer made by Mr. S. Prout Newcombe of his collection of natural history specimens and literature for exhibition. The collection includes some 21,000 objects, and is valued at £3,000. For the present it will be housed in the great hall of the Aske Schools, and will afterwards be removed to Shoreditch.

The Accrington Town Council have appointed Mr. Richard Diggle, building inspector for the corporation, to the vacant position of borough sanitary inspector at a salary of £150 per year.

Building operations will be shortly commenced upon the site of the Greenwich Workhouse at Grove-park by Mr. Rowbotham, of Birmingham, who holds the contract for the erection of the buildings, at a cost of over £175,000, to the designs of Mr. Thomas Dinwiddy, F.S.I.

It has been decided to commission Mr. W. Goscomb John, A.R.A., one of the four artists recommended to the committee by the President of the Royal Academy through the Duke of Devonshire, to execute a statue of the late Duke of Devonshire, which is to be erected at a cost of 1,000 guineas, probably at the seaward end of Devonshire-place, Eastbourne. The statue, which is to be in bronze, will have a height of 9ft., and will have a granite base.

At length there is a definite prospect of the construction of the Great Northern and City Railway. At the first half-yearly meeting, held on Tuesday, Sir C. Scott, the chairman, stated that a contract for the construction of the railway had been entered into with Messrs. S. Pearson and Son (Limited) to carry out all the works and equipment for the line. The engineers were Sir Douglas Fox and Mr. Francis Fox, who reported on Monday that at the Regent's Canal the contractors were in the possession of all the necessary houses, except one, for the temporary purposes of their yard and for the permanent generating station. The working shaft at that point had been sunk to its full depth—53ft. from the surface, and the heading to give access thence to the railway tunnels was being started. The foundations for the electric-light engine and air compressor were in place, and some of the machinery had been delivered on the ground. The construction of the special shields for driving the tunnels was also in hand.

## EXPERT PRACTICE.

**T**WO very different kinds of practice fall to the lot of the profession. The ordinary class of practice is of a general or "all-round" character, embracing within its range a large proportion of house and commercial buildings, the development of new estates, agricultural erections, certain legal and surveying branches which relate to easements, rights of light and support, valuation of property, dilapidations, &c. Sometimes the erection of churches, schools, workhouses, free libraries, baths, and municipal buildings helps to vary the routine of the provincial and general architect, though these are gradually passing beyond the grasp of the local practitioner and becoming competition prizes. We have, in the second place, the special class of practice carried on by men who devote themselves to particular buildings. These are often successful competing architects, who have won premiums for church or school buildings, municipal offices, baths, libraries, union workhouses, or other erections of a special kind. Having paid particular attention to one or other of these buildings, they have assumed the rôle of ecclesiastical, collegiate, technical school or bath and washhouse designers, and, by dint of study and hard work, become authorities in these several classes of building. Others blossom into theatre architects, experts in hospitals and unions, model dwellings, and the like. The rapid development of "specialism" in trades and professions has favoured this class of designer, though, it will be allowed, at a certain sacrifice of architectural taste in some cases, those especially where plan and administration preponderate over the artistic requirements. For example, few will be inclined to award much praise for architectural skill to any of our leading hospital or model-dwelling builders. The study and attention bestowed on administrative planning and details of such buildings give little opportunity for art—we do not mean mere architectural display. On the contrary, we believe that the development of good and definite planning is often likely to lead to the exercise of the art function. Already there are signs of this. A logical and well-studied plan honestly developed is a truer piece of architecture than a weak, purposeless arrangement clothed in the habiliments of a past style. So long as it is honest in its arrangements, and the external elevations are simple and true to it, the result is architecture; and it is only when an attempt is made to disguise the plan, or to put upon it a false expression, that failure accrues. According to this reasoning, we conclude that those engaged in a special class of work are in a better position to advance architecture as an art than men who carry on a varied practice without any very careful study of any building that falls to their hands. These are based on common models. The man who has made, say, technical schools, or baths and washhouses, a special study is not satisfied with what has been done before him. He investigates his own facts; finds out what the conditions and requirements of these buildings are; he classifies and arranges his building according to certain rules and statutory enactments; he studies their administration, and seeks to embody his conclusions in new plans of his own. Naturally he fences round what he has examined and investigated for himself, and is not inclined to give away

what he has so hardly learned; he is manifestly indisposed to share with others the results of his studies and experience, and therefore his speciality is more or less a secret to himself. This very habit of safeguarding his own acquirement encourages him to further investigation and study, and to the attainment of a higher standard; as the more expert he becomes, the higher the rate his services command. As a natural result, there is a desire to clothe these special buildings in a manner worthy of their skilful adaptation. What has cost so much in thought is worthy of artistic expression, and we find those who are experts in polytechnics, municipal buildings, schools, and the like are induced to give more attention to the architecture. To take only two examples, in the buildings designed and erected by men like Mr. E. W. Mountford, or Mr. J. M. Brydon, a true sense of architectural design is observed. These buildings are in most cases a natural outcome of the plans, without any attempt to make them appear other than they are. Even in buildings like our public baths and washhouses—so essentially utilitarian that they appear to be beyond the scope of architecture—some advance has been made, and we may point with commendation to one at least of the later public baths and washhouses—that erected by Mr. A. Hessel Tiltman in Kennington Park-road—as a satisfactory red-brick and terracotta exterior, well grouped and dignified, externally expressing the large men's swimming-bath, which runs parallel to the road, with its gable end on the return side. We have given an illustration of this building. Very often the sites chosen for large central bathing establishments are irregular, and with but small frontages, and the architect is therefore restricted, and is obliged to place his large swimming-baths and blocks of slipper-baths in positions and at various angles that make it impossible to produce effective exteriors. As, however, these large baths are now often adopted for public entertainments during the winter, the larger swimming-bath ought, if possible, to abut on two streets, so as to allow ample means of exit. The disposal of the main blocks very often can be made to tell in the architectural ensemble of even the plainest buildings, and such arrangements in buildings, like hospitals, baths, schools, can be made effective.

A comparatively small number of the profession have become experts in the design and construction of public baths and washhouses, a subject about which Mr. A. Hessel Tiltman, F.R.I.B.A., has contributed an able paper read at the Institute, and briefly reported in our last issue. The author is a master of the subject, and what he has to say on the planning and design of these buildings is worthy of attention. The plans exhibited by the author, Continental and English, were of value, as showing the possibilities of design in buildings of this description. One feature that has been turned to good account, both as a point of administration and of design, is the quadrangle entrance, such as is seen in the Tibberton-square Baths in the Essex-road. The specialist also has this further advantage, in being able to bring to his study a larger and wider view of his particular cult. He is not content, as a rule, with the examples found in his own country, but extends his studies and investigations to buildings of the same type in France, Italy, Germany, Switzerland, Austria, and other Continental countries. Whether it be the planning and design of technical schools, of hospitals, baths, and washhouses, theatres and buildings of entertainment, the expert has a far-reaching eye for the acquisition of new or improved ideas, or of technical details. We know how much our modern schools, elementary and technical, have derived from the superior classification and instruction found in Germany and Switzerland;

in fact, model school-planning is based largely on the Continental types. In hospital planning and construction, the French have taught something; in theatre design and construction the playhouses of Paris, Brussels, Vienna, and Berlin have shown our many shortcomings, and in baths and washhouses we may learn something about the distribution of these establishments in cities like Berlin and Hamburg and Vienna, where small establishments fitted up, as Mr. Tiltman has shown, with the "rain douche," serve for the majority of the poor. In the housing of the large population of the working classes also the specialist has been able to compare notes with other countries. Concentration of thought and resources is no less favoured by special designing. A practice divided between house-building, estate management, calculations and surveys of property scarcely conduces to a very favourable condition for architectural design. The expert has the advantage of concentrating his powers on one branch, and in this way perfecting it in many details that would escape the attention of the ordinary practitioner. In course of time he finds how the commonest detail of his work can be made to serve its purpose with the greatest nicety. He alters, modifies, and amends it till nothing better can be reached, and in this way the expert is distinguished for precision—a quality which is at the very root of good architecture. The specialist-architect's work becomes less laborious by this direction of his faculties to achieve certain objects, the work of design is easier to him because he has everything at his finger's ends. No doubt also this predilection for one class of work indisposes him for other kinds of work, and we seldom hear of a designer of hospitals or baths or model dwellings becoming successful as an architect of church or domestic work of a superior class. We believe our architecture and its kindred arts will become fuller and deeper if those who are leaders in each special branch will make known their experiences by means of books, lectures, and examples—a course of proceeding which many, for the reason we have given, are not inclined to take. The more we think of the possibilities and limits of each class of building, the better able we shall be to make an advance all along the line, and to see how possible it is to develop a distinct architecture for each type, instead of to flounder about in a kind of chaos of forms that are indiscriminately applied to schools and hospitals and baths and town-halls, just as our fancy dictates.

## MODEL SPECIFICATIONS.—LII.

PAINTER, DECORATOR, ETC.

**P**AINTING new plaster ought to be done only after it is quite dry. Plaster of Paris can be painted a few days after being put on, but Parian and Keene's cement may be painted a few hours after they are laid. In painting walls specify to stop up cracks and holes with Parian or Keene's cement; after the stopping is dry, it should be rubbed down, the surface dusted, and the first coat put on. This should be rather thin, so as to penetrate the pores of the plaster; after a day for drying, the second coat (a little thicker) may be put on with a little more oil, and its colour should approach that of the finishing colour, but lighter. If unevenness, dents, or irregularities appear or show up by the gloss of the paint, the surface must be faced up with putty or stopping after it has dried, and after the stopping is hard glasspaper down and dust surface. The third coat may now be put on similar to the last, but with more oil. The next coat, if there are to be four, may be "flatted," and this is the best finish for walls, and it should be put on immediately the under coat is dry enough. If the walls have much wear, a

little copal varnish should be added to the turpentine to harden it. Old uneven walls show up less with a dead flat finish than if they are glossy.

For rough stuccoed walls the first coats should have more oil and less turpentine, and rubbing down will not be required. Cracks should be stopped with Roman cement or oil mastic. Portland cement takes some time before it can be painted over.

For outside parget or half-timbered work, specify a first coat of thin colour and boiled oil, unless the paint is white, then raw oil can be used in the finishing coats. The exposed sides of stuccoed houses should have a first coat of boiled oil and red-lead.

For damp and exposed walls and for stone and brickwork we should recommend the application of three coats of Szerelmey's "stone liquid," which waterproofs stone, brick, and plaster. (Apply to the manufacturers for particulars.)

Sometimes stone-dust is thrown on the wet oily coat of paint; but the imitation is not advisable. For treatment of stone, the Bath Stone Firm's Ltd. solution, "Fluate," is the better way of checking absorption of moisture.

When brick and plaster walls are to be coloured, "Duresco" is to be preferred to paint, which renders the bricks impervious. It is a sort of washable distemper, consisting of barytes, oil, glue, &c.

Distemper is largely used upon inside surfaces; it is made from pigment mixed with water, to which some adhesive substance like size is added. For large surfaces and decoration distemper is a valuable substitute for paint: it admits of delicacy of tints, and can be worked rapidly. It is well adapted for interior decorations like ceilings and friezes when moisture is absent. The wall should have a porous surface to give a "key," and a finish of sharp sand is better than lime putty. Many ancient buildings attest its durability. Previous to distempering walls they may be lined and clearcoiled. Clearcole is a solution of thin size and whiting with a little alum, and is used to render the plaster non-absorbent.

Hard woods are now so much used for ornamental joinery, that staining has been increasingly employed. The Canadian red Kauri, and other woods have a beautiful grain, which transparent staining reveals. There are several kinds of staining—water-staining, oil-staining, spirit-staining, &c. Water-staining is a body colour ground in water, as ochre and umber, to which size is added; oil-staining is done with oil colours, more or less transparent, like sienna, vandyke brown, aniline lakes; and varnish-staining uses varnish with the oil, and prepares the surface for varnishing or polishing. Oil stains are most durable, but water stains allow the grain to be seen the best. Water-staining should be done on new woodwork, as it has left the plane. Glass-papering is undesirable. Before the varnishing coat is put on, the work is sometimes sized.

Decorative effects are sometimes produced by staining so as to resemble inlay work. Patterns cut out of paper of ornamental designs or borders are pasted on the panel or woodwork, sized, and the whole panel oil-stained; when the staining is dry the paper pattern is removed, and the pattern remains. White wood and pine make good grounds for decoration.

#### GLAZING.

25. *Ornamental Fret Glazing.*—The door and window panels (or panes) marked on elevation to be filled with ornamental fretwork to design, the glazing being of tinted, muffled, cathedral, or other glass approved by architect, with ornamental borders and floral or other centres.

26. *Rolled Figured Glass.*—The panels of front above transom and those of screens to be glazed with rolled figured glass on leaded lights, in tints approved by architect. Or—

The panels of screens or interior partitions to

be glazed with figured, rolled (or cathedral, muffled), and coloured glass; describe patterns in Nicholls and Clarke's catalogue; bedded in wash-leather and with screwed beads.

#### PAINTING (continued).

9. *External Woodwork.*—Knot, prime, stop, and paint in four oils all the external woodwork usually painted.

*Internal.*—Knot, prime, stop, and paint in three (or four) oils all the internal woodwork usually painted.

10. *Drawing-Room.*—The drawing-room and best bedrooms to be finished, a flat mixed with varnish in party colours, the panel mouldings, architraves, &c., being picked out in a separate tint approved. (Or finish a flat white mixed with varnish, or French oil varnish.)

11. *First-Class Work.*—Face down woodwork, stop with hard stopping paint three (or more) coats in oil-colour, and finish one coat flat white mixed with varnish, and one coat of best French oil varnish or white enamel.

12. *Imitation.*—Finish the dining-room woodwork with imitation wood (maple, walnut, &c.), graining and overgraining, and varnish three times in copal, and felt down between coats, and hand polish. (Three or four coats of paint as a preparation are required.)

13. *Ironwork.*—Scrape, prepare, and paint all ironwork externally four coats (two coats of oxide before fixing). The eaves guttering inside and out, and all ironwork internally two coats. Or—All external ironwork to be scraped, and all rust and scales removed and painted two coats of oxide paint (or of red-lead and linseed-oil) before fixing, and two coats after fixing. All steel or iron joists exposed to view, and all internal ironwork are to have three coats of oil paint.

Scrape, prepare, and paint two coats with red-lead and boiled oil all castings while still warm, and the last two coats to be mixed with varnish.

14. *Plaster Cornices.*—Paint the enriched cornices of ceilings, &c., with four coats of oil colour, finished flat. Also paint the cement-work, moulded angles, skirtings, and architraves with four coats. State if finished in enamel paint.

(Portland cement should be thoroughly dry, and five or six coats are necessary. Walls to be painted should be plastered with Parian or Keene's.)

15. *On Plaster.*—Face down, stop, and prepare plasterwork of walls to smooth surface, paint one coat in oil, fill up with distemper filling, face down, oil in, paint three or more coats, and finish one coat stippled in flat colour mixed with varnish in tints.

16. *Distemper Ceiling and Walls.*—Rub down with glass paper and stop all cracks with plaster of Paris (Keene's or Parian cement). Cut out all cracks and holes to form proper "key" for stopping, and remove all loose plaster. Clearcole the ceiling with weak jelly size mixed with a little alum, and distemper to tints. Or—

Fill up cracks with Parian cement, prepare ceilings and walls, line with lining paper, lap joints, clearcole and distemper to the required tint with Hall's sanitary washable distemper.

17. *Decorative Painting.*—Face down, stop and

prepare plaster walls of hall or lecture-room to a smooth surface, paint first coat in oil, fill up with distemper filling, and face down, and paint three or more coats in oil colour, and stiple in flat colour mixed with varnish, and pick out in tints (describe) the mouldings of cornice and frieze, ceiling ribs, panels, centre flowers, &c.

18. *Staining.*—The woodwork to be stained, stopped, twice-sized, and twice varnished in copal (or to be stained with Stephens' stain, the tint to be approved; sized, and twice varnished.)

Clean floors and remove all stains of ink, &c., and stain floor with oil (or water stain) of approved colour, freely laid on and allowed to soak into the wood. (Sizing and stopping previous to staining is not recommended by some authorities, as it does not wear well.) Or—

Clean woodwork, remove all ink stains, &c., and stain with Stephens' or Manders' prepared stains, selected by architect (or specify Stephens' vandyke brown, or raw and burnt sienna or umber in water).

19. *Oak Graining.*—Finish the kitchen, hall (or other part) with oak graining (combed), and twice varnish in opal. Or—

Grain and overgrain, varnish three times in copal, felt down between coats, and hand polish.

20. *Oiling and Polishing.*—Twice oil all the teak, maple, and other ornamental woods before polishing, and well rub up after each oiling.

French polish in the best manner all the wainscot and mahogany, &c., and protect the same till completion of work.

Touch up painting, &c., at completion, and leave perfect to the architect's satisfaction.

21. *Oil Gilding.*—The raised or relief ornament to doorways (or all enriched members) to be oil-gilded.

22. *Leaf Gilding.*—Gild the enriched mouldings of architraves and cornices, panels and skirtings in drawing-room (or saloon) in single (or double) gold leaf. The gilding to be burnished (or left dead) and sized. Or—

Oil gold size the mouldings of panels, architraves, cornices, and skirtings for gilding, or size with japanners' gold size, and gild with the best gold leaf; or specify water gold size for papier-mâché plaster or composition enrichment; or burnish or matt gold size, and gild with gold leaf, giving ½ in. lap, and leave perfect. (Gold size must be laid evenly and sparsely, and for wear oil gold size is best. The size should be just "tacky" enough to hold the gold leaf, nor should the size be too wet. Burnish and matt gilding are both used in enriched ornamentation. The work is brought up to a good surface in size or whiting, and then coated with five coats of size burnish or matt size, each coat glasspapered. When the ground is well prepared in this way, the gold is laid wetted with water. As the moisture dries, the gold adheres to the size coat. The burnished part is polished by an agate burnisher, and must not be sized. Oil gilding is richer, and more durable than water size.)

Under the Decorator's trade may be introduced clauses for various kinds of applied decorations, like the "United Asbestos Patent," "Salamander" decorations (see "Plasterer"); or the "Anaglypta" decora-

## SOME DEVONSHIRE STOCKS.

tions (W. Woollams and Co). These are cheap and effective decorations for ceilings, friezes, panellings, dados, and are produced in low and bold relief. Particulars, prices, and patterns can be obtained on application to the makers or firms mentioned.

## SOME DEVONSHIRE STOCKS.

SINCE the great sale of old carved oak work at Dulford House, near Cullompton, in East Devon, in September, 1878, there has been no collection of such magnitude disposed of in this county until last month, when those of the late Right Hon. Sir Francis Clare Ford, G.C.B., G.C.M.G., &c., for many years Ambassador at Rome, and of Heavitree House, near Exeter, were brought under the hammer. Since this recent sale, illustrations of some of the antique furniture have appeared in these pages. Heavitree (in Domesday *Hevetrove*, a hive-tree), is practically a suburb of the "ever faithful" city, and the western tower of its parish church (dedicated to St. Michael) is almost within the shadow of Heavitree House. The late Sir Clare was a native of the village, having first seen the light there in 1828. In the collection recently sold were the parish stocks. How they got originally into his possession there is now no record. One would have imagined that, at the auction, the parson, churchwardens, or, at least, some one official, or one in position in the parish, would have secured so interesting a relic of former local punishment for preservation for posterity. This, however, was not the case. The things were viewed with apathy by those present, and so, to "save their lives," I purchased them myself, and they are now added to my somewhat large collection of ancient Devonshire woodwork. Here is an illustration of them. They are of oak, of massive construction, and in excellent workable preservation. It will be noticed that at one end is shown a cannon-ball, weighing 16½ lb., into which is let an iron tube, having a slot cut into it. This upright bar is attached, by a well-worn chain, to a sort of rivet-headed bolt. There are also a couple of headed iron pins, or spikes, as shown. These accessories were sold as part and parcel of the stocks, and they appear to be of the same date; but what their original use was puzzles me. I have consulted several authorities, inclusive of Mr. William Andrews, F.R.H.S., author of "Punishments in the Olden Time"; but no satisfactory explanation has yet been received. Stocks occur in several of Hogarth's pictures; but that famous artist evidently thought stocks were items of mere detail quite beneath his notice, as he invariably drew them straight up and down, just as the merest schoolboy might have been expected to do.

HARRY HEMS.

## LONDON AND PROVINCIAL BUILDERS' FOREMEN'S ASSOCIATION ANNUAL DINNER.

THE annual dinner of this association was held on Saturday last, Feb. 11, at Anderton's Hotel, when upwards of 170 gentlemen connected with the building and kindred trades dined together, under the presidency of Mr. G. J. Elphick, of Messrs. Treasure and Son, supported by Messrs. Treasure, Collinson, Wimpey, Carmichael, Butler, Wilson, Mills, Bloore, Sammings, Todd, Rudall, Minter, Woodward,

Croggon, and many others. The chairman, in proposing "Success to the London and Provincial Builders' Foremen's Association," spoke of the benefit this association was to those engaged in the carrying on of work by spreading uniformity of ideas, and hoped the association would meet with the success and support it deserved both from builders and foremen. Mr. Knowles, the president of the association, in returning thanks, took occasion to invite those gentlemen present who happened to be builders' foremen to become members, at the same time explaining the objects of the association, which he summarised as being chiefly educational, coupled with benevolence and assistance to its members in obtaining fresh engagements. The toast of "The Chairman" was given by Mr. Cook and received with musical honours, and the chairman, in replying, expressed the great pleasure it had given him to preside on this occasion. Mr. Isaac Young, Assoc. San. Inst., proposed "Success to the Building Trades" and the toast having been duly responded to by Mr. Mills, the proceedings terminated by singing "Auld Lang Syne."

## THE SUPERVISION AND REGULATION OF BUILDING OPERATIONS IN EDINBURGH.\*

(Concluded from p. 191.)

I THINK you are now fully informed as to the requirements of the statute, and also as to the kind of legal objections which may be raised against a petition, and I may now complete my account of

## THE PROCEDURE IN THE COURT.

First we shall assume a case in which no respondent is appearing. If the court, on consideration of the burgh engineer's report and examination of the plans, finds that these are deficient in any respect, they will indicate this to the petitioner, and there and then allow him an opportunity of amending the plans. If he complies, warrant will be granted. If he will not comply, and asks the court to deal with the plans as they stand, the court will refuse warrant, stating, of course the ground of refusal. This judgment is written on the petition and signed, as all deliverances of the court are, by the Dean of Guild. I may say that it had been decided that the Dean of Guild Court may not refuse a warrant without stating clearly the grounds of refusal. Next we shall assume a case in which the court is satisfied, but in which the corporation appears as respondent, and takes the objection that in some respect the petitioner has failed in his obligations to the city authorities, such as that his building is higher than he may erect it without the consent of the corporation; then the court will continue the case until the consent of the corporation be obtained. In the event of a refusal to do this, or to modify the plans, warrant will be refused. Lastly, we shall assume a case in which the court and the corporation are both satisfied, but in which a neighbouring proprietor appears and states a legal objection. In this event also the court may adjourn the case to allow the petitioner an opportunity of amending his plans or of coming to terms with his neighbour; but, failing this, written pleadings have to be prepared on both sides, and titles lodged. When

\* Abstract of a paper read before the Society of Architects on Thursday, Jan. 26, 1893, by DAVID LYON, Clerk to the Edinburgh Dean of Guild Court.

the parties have completed their pleadings and adjusted the issues, as it is called, that is, made a complete record of the arguments on both sides, the case is remitted to the legal assessor of the court. A date is fixed for a debate before him by the lawyers representing the parties, and having heard them and examined the titles, he writes an opinion on the case, in accordance with which the court issues judgment. The court does not review or in any way interfere with this advising by its legal assessor; it simply accepts it, and issues judgment accordingly. Of course, if there appears to be a competition of title, the assessor will advise the court to delay the case until the parties have in a competent court decided the question of the rights of property in the subjects under consideration. When that has been done, if the petitioner has succeeded in vindicating his title, the Dean of Guild Court will naturally, other matters being adjusted, grant warrant. If the petitioner has failed, he will not proceed further with his petition.

## NO EXAMINATION OF WITNESSES.

Before leaving this part of my subject, I ought to say that in the Dean of Guild Court there is practically never a proof or examination of witnesses. That it is competent there is no doubt; but in my 26 years' experience of the court I have only known of one case in which a proof was allowed, and then it was not taken advantage of by the party applying for it. But it is usual if either of the parties desire it, or if the court deems it expedient, for the court to visit and inspect buildings proposed to be altered, in order to better understand the effect of the proposed alterations. It will be obvious to you that in dealing with practical questions no extraneous evidence is necessary when the men of skill composing this court, possessed of every qualification to form a sound judgment on such matters, personally visit a property and satisfy themselves as to the state of the building, and the bearing of the petitioner's proposals on it and on the surrounding properties. At these visits all parties interested may attend. That, then, is a general account of the mode of procedure in the court. If, however, any petitioner or respondent is dissatisfied with a decision of the court he has the right to appeal, and the Court of Appeal is the Court of Session, our highest legal court, there being no Special Court of Appeal for Dean of Guild Court cases. As I have indicated, it is rather

## A FORLORN HOPE TO APPEAL

to the superior court on a purely practical point, because the Supreme Court is a court of law, and will not interfere with the judgment of practical men on practical questions. But, as you have seen, the court has many statutory powers, and the construction of an Act of Parliament is always open to argument, so that the petitioner, in the case of the refusal of a warrant by the court, may consider that its interpretation of the law is wrong, or that the law does not confer on it the power which it has exercised, or in a case where purely legal objections have been taken, either party may hold that the advising by the legal assessor is wrong in law. In any case the appeal is to the Court of Session, and as that is a purely legal tribunal, I need not deal with the procedure there further than to say that when they find that the Dean of Guild Court has gone wrong, which I am pleased to say in the case of Edinburgh has been very seldom, they recall the judgment of the Dean of Guild Court; and remit back the case to that court for further procedure, as

it is called, on the lines indicated by the decision of the superior court. The judgment of the superior court itself, however, is in these cases, as in all others, subject to appeal to the House of Lords, and some of our cases have actually gone that length; but I am sure you will be glad to hear that at this point the possibilities of litigation have reached their limit, and the decision of the House of Lords is final. I shall now deal with

#### THE SUPERVISION OF BUILDINGS

in course of erection or alteration after warrant has been granted. The duration of a warrant is by law limited to three years from the date of granting, with the proviso that in an exceptional case the court, at the time of granting, may extend the time of endurance to a period not exceeding five years from the date of the warrant, and also that the period of endurance of any warrant may, in the discretion of the Dean of Guild or his court, be renewed for a period not exceeding three years from the date of renewal; also that the person by whom, or under whose orders, any house or building is being erected or altered, or any work done, if other than the petitioner in whose favour the warrant of the Dean of Guild Court has been granted, shall be liable for the due observance of the terms of such warrant. This is necessary, because in some cases the person who obtains the warrant disposes of the ground on which he proposed to build, or of the building which he proposed to alter, and hands on his warrant to the purchaser. Before any building operations are commenced the petitioner must intimate his intention of beginning to the clerk of court, who passes on this intimation to the master of works, along with the plans, conformity to which warrant has been granted. It is now the duty of the Master of Works to inspect the building from time to time, and satisfy himself that it is being erected in conformity with the plans, and also with the building rules, which must be observed in all cases, and a copy of which is attached to the warrant, when it is issued to the petitioner. Then within a month after any new house or building or alteration is completed, and before it is occupied, the owner or the builder must intimate that the building is ready for inspection before being occupied, and the master of works, if satisfied after survey that it is fit for occupation, and is in accordance with the provisions and requirements of the law, grants a certificate to that effect, and any owner or builder failing to give such notice, or permitting such building to be occupied before obtaining this certificate, is liable to be punished. The master of works, as I have already said, has a large staff of assistants engaged in this work of inspection, most of whom are men who have been trained in some branch of the building trade, and the supervision of buildings in course of erection and of the materials used is thus in the hands of men who well understand the work with which they are intrusted. The court has further

#### THE POWER TO PUNISH PERSONS

breaking its laws. The Act says:—"Every person who shall erect or begin to erect any house or building, or alter the structure of any existing house or building, or use for human habitation any building not previously so used, or alter the mode of occupancy of any existing house in such a manner as will increase the number of separate houses or occupiers without a warrant, or otherwise than in conformity with a warrant of the Dean of Guild Court, and every person who shall, in the erection or alteration of any house or building, the erection or alteration of which has been sanctioned by the Dean of Guild Court, deviate from the plan or plans, and section or sections, elevation or elevations, and detail drawings, so sanctioned, or shall, in the erection or alteration of any house or building, in any way contravene the building rules of this Act, shall be liable to a penalty not exceeding £25, besides being bound, if and in so far as required by the Dean of Guild Court, to take down and remove the said house or building, or to restore it to the state it was in previous to the alterations thereon, or to alter it in such way as the Dean of Guild Court shall direct, so as to make it in conformity with the warrant of the Dean of Guild Court; and the Dean of Guild Court may grant an interdict for the prevention of any such erection, or alteration, or deviation being proceeded with until the extracted warrant of the court shall be obtained for the same." And this brings us to the functions of the procurator fiscal, for it is he who

institutes proceedings against the offender, and it is with him that any information is laid either by the master of works or by a private individual in the event of a contravention of the law. If the procurator fiscal is satisfied that an offence has been committed—and I must tell you that he has a discretion on this point—he presents a petition to the court stating his grounds of complaint, and the offender is summoned to the bar of the court. In the case of a person building or altering property without a warrant, the court will first ordain him to apply for warrant in the ordinary way, and will then impose a penalty for proceeding without a warrant. In the case of deviation from plans already approved of, the court will either ordain him to alter his building in conformity with the plans, or, in the event of the deviation being such a one as the court would have sanctioned had its authority been asked, the offender is ordered to lodge a plan showing the deviation; but after approval he will be fined for his breach of warrant. The court is always ready informally to consider and approve of such small deviations in, say, the internal arrangements of a house in course of construction, and the plan of the deviation is filed along with the original plans. What is aimed at is to secure that an exact record may be kept of all building operations, and the existence of this record is being found so valuable to architects and builders, and, indeed, to all persons interested and dealing in property, that great readiness is being shown to comply with the wishes of the court in this respect.

#### DEALINGS WITH DANGEROUS STRUCTURES.

Proceedings are also taken by the procurator fiscal in all cases where a building is reported by the burgh engineer to be ruinous or insecure, and where the proprietors have failed in compliance with his intimation, to repair, take down or secure such building. Many of the buildings, especially in the older portions of Edinburgh, are large stone tenements of dwelling houses or shops, and dwelling houses where probably each house and shop is owned by a different proprietor. Consequently, when the burgh engineer serves his notices on the owners of such a tenement which has become insecure, there is usually such a difficulty among them in deciding what should be done that nothing is done at all. The burgh engineer, therefore, reports the matter to the procurator fiscal, who proceeds by a petition to the court directed against all the proprietors. He does not stop at this point to inquire into the amount of liability falling on each: he brings them all into court. What is urgent is that the safety of the public be secured, and the court visits the building, at once decides on the operations necessary to secure it, and there and then issues an order on the proprietors to carry out these operations. Failing their commencing to do so forthwith and completing the same within a specified time, the procurator fiscal is authorised to employ proper persons to do the work at the expense of the proprietors. When the work comes to be paid for, the court will then adjudicate as to the liability of each proprietor and fix the proportion which he must pay. If an owner cannot be found, as has happened, the court may dispose of the property, pay for the work out of the proceeds of the sale, and deposit the remainder, if any, in bank subject to its further order. Finally, the court will, on the application of the Procurator Fiscal, visit and inspect any building used as a place of public entertainment, and may, after hearing the persons interested, direct such means to be taken for the proper ventilation, or for providing proper accesses and exits for such building, and for protection from fire and other dangers to the public as the court think fit. Lest I, as an official, should be biased in my opinion, I have, since I received your invitation to read this paper, elicited the opinion of a large number of professional men, lawyers, and architects, and also of builders, as to

#### THE MERITS OF THE DEAN OF GUILD COURT

as a tribunal for dealing with building questions, and practically it has amounted to this: that while the jurisdiction and procedure of the court might be improved in detail, it is, so far, especially in large cities where men of skill and standing are readily available for election to the court, the best institution for its particular work which has yet been devised. It has the advantage of providing an independent medium to adjudicate between the petitioner and that much-

abused person the permanent official, and between between party and party. All proposals and objections are filtered through the minds of a body of practical men guided in the legal aspect of cases by a legal assessor, and restrained by the fact that their business must be conducted in a fair and judicial manner, and that all their proceedings are subject to review by an extremely critical legal court. The procedure is summary; by which I mean that it is to be conducted with reasonable despatch, and the expense incurred in obtaining a warrant is small—in the majority of our cases probably not exceeding 20s. It has the further advantage of securing a uniformity of procedure in all cases, as of course such a court is bound by its own decisions and by precedent. Above all, its business is conducted in open court, and all its procedure is public, and that is, in my opinion, one of the best guarantees that onerous public duties like these discharged by a body of unpaid judges shall be dealt with justly and equitably without fear, favour, or ill-will. Finally, I may say that the court in Edinburgh, both from its constitution and the manner and spirit in which its business has been conducted, possesses, I believe, the perfect confidence of the public whose interests it safeguards, and of the parties and the practitioners who come before it.

#### THE PALACE OF JUSTICE, BUDA-PESTH.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THE two photographic plates which we give to-day are reproduced by the courtesy of Mr. Ernest Wasmuth, the enterprising publisher of Berlin, whose "Architektur der Gegenwart," with descriptions by Mr. Hugo Licht, has now reached its eighteenth part. The work illustrates a vast number of highly instructive modern buildings, including churches, palaces, theatres, and public undertakings, well worthy of study. The Palace of Justice at Buda-Pesth may be taken as a notable example. This great building is the seat of the Supreme Court of Judicature for the kingdom of Hungary. It comprises the Royal Ecclesiastical Courts and the Courts of the Second Instance, as also the Royal Appellate Court. For the ordinary courts ten halls are set apart, six halls being used by the Court of Appeal. There are in addition two state rooms for entertainments and receptions. The buildings contain the quarters of the Royal State Attorneys' Department. The façades, which are very monumental in their design, are executed in Söskut sandstone, the base being of granite. The central portion of the main front is flanked by two towers, and is surmounted by a group of three horses, executed by Mr. Karl Sennyey, the eminent Hungarian sculptor. The pediment is sculptured by Mr. Georg Zala. The whole extent of the façade is given in the smaller view above the detailed photograph of this central feature. Inside, the buildings are equally rich and dignified in their treatment, the chief feature being, of course, the great hall, round which the courts are grouped. The loungers' lobby and visitors' hall, and also the grand staircase, are elaborated in costly materials and polished Hungarian marbles, the whole scheme being conceived in a lofty scale with boldly-proportioned features. The centre of the vaulted ceiling of the Great Hall has been decorated by a painting by Prof. Karl Lotz, and it is described as one of his most splendid conceptions. At the head of the grand staircase is a statue of "Justice," seated under the central bay of the arcade and dominating the hall. This is the masterful work of Mr. Alajos Strobl. The architect was Prof. Alois Hauszmann, hon. corresponding member R.I.B.A. The cost of the building amounted to about £295,000, and the site cost nearly £50,000. The plans given with the text show the arrangement of the buildings, and the following index gives the references to the numbers figured on the plans:—1, Works office; 2, manager's department; 3, chancellor's department; 4, comptroller; 5, treasurer; 6, manager's room; 7, inquiry office; 8, chief officer's room; 9, anteroom; 10, records office; 11, head officer, chancellery; 12, chief manager; 13, files of criminal proceedings; 14, files of civil proceedings; 15, barristers' room; 16, anteroom and attendants' room; 17, draftsmen's study; 18, reception-room; 19, keeper of the records, Royal Appellate Court; 20, lobby for notices; 21, deputy public prosecutor; 22, records, Royal Appellate Court; 23, lumber-room; 24, keeper of the records, Royal Eccle-

THE PALACE OF JUSTICE, BUDA-PESTH.

siastical Court; 25, assistant's office; 26, registration of judgments office; 27, despatch of business office; 28, workroom; 29, secretary's office; 30, stores-room; 31, paying-office; 32, secretary's assistants; 33, president's reception-room; 34, room; 35, conference-room; 36, judges; 37, president; 38, writers; 39, civil court; 40, witnesses; 41, library and reading-room; 42, sessions room, Appellate Court; 43, state room, Royal Ecclesiastical Court; 44, president's chancellery; 45, president's record-room; 46, president's study; 47, president's reception-room; 48, visitors' hall; 49, waiting-room.

The interior restoration scheme at St. Mark's Church, East Hull, has just reached its completion in the opening and dedication of a new organ, built by Messrs. Abbot and Smith, of Leeds.

#### WINCHESTER CATHEDRAL NAVE ROOF.

A HIGHLY interesting account has been published by the Dean and Chapter of Winchester Cathedral,\* placing on record the process of reparation now carried out by the architect to the cathedral, Mr. T. B. Colson, F.R.I.B.A. (senior partner of the firm of Colson, Farrow, and Nisbett, of Winchester and London), who has just lately renewed and strengthened the historic roof over the nave. The work became necessary in consequence of the defective state of the external covering, together with the general disorganisation of the timber framing. The conditions were such as to render the ordinary patching and repairing quite futile, and to make it necessary

\* Messrs. Warren and Son, High-street, Winchester.

for works to be undertaken on a much larger and broader scale. It is admitted that these works were not put in hand any too soon. The roof itself originally was the extent intended by the operations authorised by the Chapter, and it was not till this work was nearing completion that it was decided to make use of the scaffolding and plant in treating other parts of the fabric. Thus, in addition to that of the nave, the roofs of the chancel, of the north transept, of the eastern and western aisles of the north transept, and a portion of that of the south presbytery aisle, also the nave vaulting and the belfry floor, have undergone a work of repair intended to insure their immediate and, as far as practicable, their future preservation. The roof of the nave south aisle is still in a bad condition, and requires treatment similar to that applied to the roofs mentioned.

Mr. Colson has placed two sections at our disposal for the purpose of illustrating the old roof and the work which has now been completed. The photographs show the original roof before the reparation was commenced. The one represents the south side of the nave roof, and the other illustrates the north side. This roof undoubtedly consisted of the rafters extending from the apex of the roof to the outer wall plate, the collars or horizontal pieces extending from north to south with their braces, and the ashlar connecting the rafters with the inner wall-plate, together with the tie-beams extending from wall to wall north to south. There was some difference of opinion as to the age and date of this erection. All the uprights—from the beams, the horizontal timbers extending east and west, the multitudinous struttings, bracings, scarfings, and other supports apparent under the collars—are entirely foreign to the original structure. There is no record as to when these were inserted, and their date was therefore merely a matter of conjecture. Mr. Ewan Christian, in a report to the Dean and Chapter in 1873, mentioned the roof as "without doubt Wykeham's work." Others, however, have asserted it to be the original Norman roof, with later work and reparations of or about Wykeham's time. There is much evidence to prove that the latter opinion is more likely to be correct; but whether the reparations were effected prior to, or subsequent to, Wykeham's time is still a vexed question, and one not easily determined. The tie-beams undoubtedly existed prior to the vaulting, as the former were bedded in the latter, the vaulting having been built up round them, and therefore point to an earlier period than that of Wykeham. The portion of the original rafters and timbers remaining were coeval with the ties, and similar in dimensions and character to those in the south transept roof, which is unquestionably part of the original Norman structure. It may therefore be fairly assumed that the older timbers in the nave were also of Norman date; but the extraordinary mutilations that they had undergone tended to deceive the eye and to give the appearance of a structure erected at a much later date. The various scarfings were no doubt the result of this extraordinary pressure being on the tie-beams, and have probably been made subsequently to Wykeham's restoration of the roof. This master's boldness in casing, strengthening, and increasing the thickness of the original Norman walls no doubt averted much mischief that the condition of the roof would otherwise have produced; but it never was intended that the grand and graceful vaulting and groining of the nave should in any way be subject to the weight that had become imposed upon it. Unless the same had been removed, some serious mischief must have ensued, and that it had actually begun was apparent from the fact that several extensive fissures were found existing in the vaulting.

The ribs of the vaulting had in some cases been bolted up to the timbers, supported near the end of the tie-beams; but as these tie-beams were themselves supported by the vaulting, which was hung up to them, the effect, instead of being remedial, was only mischievous.

The main rafters were in nearly every instance disconnected at the apex, and the whole series of bracings and struttings had become so dislocated as to leave the roof with little inherent strength. From the similarity of the scarfings of the tie-beams they all appeared to have been executed about the same period, and it was in a great measure due to their unskilful construction that the timbers of the roof had sunk, and were lying a dead weight on the vaulting. Natural decay of the timbers, especially at their weakest parts—viz., at the tenons and mortises of the framings—had also added to the general disintegration and disorganisation of the whole structure. Mr. Colson's first section shows the pitch of the Norman roof. A, A indicate the Norman timbers reframed by Wykeham 1367-1404; B, B, the new timbers he inserted; and C, C, the subsequent scarfings. The second section illustrates how the renewal of the roof has been carried out, D, D, D being Mr. Colson's work. Note that in the former drawing the ties rest on the crown of the vaulting, while in the other diagram they stand some 5in. clear above it.

Considerable mystery was attached to the fact of the old rafters being supported upon plates and sills raised off the walls, as shown by section No. 1. It was surmised that the feet of the rafters had become defective, and

so were cut off, and that this method of support was adopted instead of renewing the whole rafter or splicing the ends of the timbers in order to obtain the required length. The Norman roof, as indicated by the string-course on the tower, was of a flatter pitch, and the length of this projecting string exactly coincided with the rafter on the north side of Wykeham's roof. It thus is concluded that Wykeham reconstructed the roof with the original Norman timbers as far as they were serviceable, thus retaining the general Norman appearance of the structure, the increased "pitch" in conformity with Edington's gable at the west end being obtained by raising the rafter-feet off the walls and supporting them as described. It was this arrangement of various lengths of rafters with sills at different levels and no direct tie that caused the mischief. Lifting trusses have now been introduced very cleverly on each side of the tie-beams, which by these means have been raised, and the vaulting is thus relieved of enormous pressure. Owing to the difficulty of obtaining English oak of the length and size (each 45ft. long, 12in. wide, and 20in. deep), it was found necessary to resort to the use of oak from Stettin. A false sill piece has been inserted at the back of the rafters on the north side at a corresponding level to that of the sill on the south side, and these sills have been securely tied together from north to south with stout iron bolts. With the exception of new battening and covering with recast lead, the five westernmost bays of the roof have needed no repair. The timbers had greatly decayed by the action of the worm, which necessitated as much as two-thirds of the structure being replaced with new oak. The insect causing this sad havoc is known as the "Sirex gigas." In its grub state it does the mischief, eating away the timbers till these were literally honeycombed. We cannot follow Mr. Colson in the description of the repairs he has so well done to the "lierne" vaulting of the nave. The travelling-bridge platform resting on cantilevers, used as a scaffold inside the church, was alone a most ingenious erection. We are told that the Society for the Protection of Ancient Buildings has approved of the plans adopted by the architect, and the manner in which the work has been carried out. An appeal is issued for funds, as nearly £6,000 is required to pay for what has been done. The cost has been £11,918 10s. 11d. Messrs. Thompson, of Peterborough, were the builders, and Mr. Russell was the foreman. Sir J. Wolfe Barry, K.C.B., was consulted by the Dean and Chapter, and he thoroughly agreed with the scheme now carried out by Mr. Colson, its author. The photographs given were taken by Mr. Rider, of Winchester.

#### SEWER VENTILATION.

THERE is perhaps no branch of sanitary science that is attracting so much attention at the present time as the ventilation of sewers. The system illustrated on the opposite page seems, from the reports received, to effectually accomplish this. It has the great advantage of being self-acting, and, therefore, cannot get out of order, nor, when once fixed, does it necessitate any attention or after-cost to keep it in operation. With this system a double power is obtained—viz., the aspirating force of the "air-pump" ventilator, which is always in action even when there is no perceptible movement of the air, and the downward air-propelling action of the down-cast ventilator; the principle being a combination of extraction and impulsion by the utilisation of natural forces.

The sewer is divided into sections by means of valves of a special construction, an upcast-shaft being fixed at one end of the section, and a downcast-shaft at the other end; the air continuously passing through the sewer in a given direction.

The illustration shows the air being admitted at the lower end of the section, and extracted at the upper end; but this arrangement may be reversed, it being as yet an unsettled question amongst sanitary engineers whether the air-supply should pass up the sewer or down the sewer to secure the best results.

With this system, which is known as the "Boyle System of Ventilation for Sewers," it is claimed that all smells and noxious gases arising from the sewers being ejected above the house-tops, and the air-supply being taken from there,

they cannot prove either a source of annoyance or a danger to health, as is notoriously the case where street ventilators alone are employed.

#### THE REMUNERATION OF CLERKS OF WORKS.

THE sixteenth annual dinner of the Clerks of Works Association of Great Britain was held on Monday evening at the Holborn Restaurant, when a numerous company assembled. Mr. E. W. Mountford, F.R.I.B.A., had been announced to take the chair; but, in consequence of the illness of his wife, he was unable to be present, and his place was occupied by his former fellow pupil, Mr. W. H. Seth-Smith, F.R.I.B.A. The toast of "The Navy, Army, and Reserve Forces," was given from the chair, and acknowledged by Mr. J. Aitchison. Mr. F. Dashwood, secretary of the association, proposed the health of "The Architects and Surveyors" in a drily humorous speech interspersed with anecdotes. Nowhere, he thought, would that toast be more heartily received than by clerks of works, for, but for the architectural profession, their association would have had no opportunities for existence; it was certain that, unless advised by his architect, the building owner would not realise the advantage and desirability of employing a clerk of works on his undertaking. He would ask architects to do their utmost to obtain for the members an advance of salary commensurate with the general rise in wages in the building trades. During the past thirty years the wages of all building operatives had advanced from 25 to 30 per cent.; but there had been no corresponding improvement in the position of the clerk of works. They were told in ancient writ that the labourer was worthy of his hire, and at the present day other people thought he not only got it, but also a surplussage. Indeed, it had been asserted that with shorter hours and enhanced wages the British workman did less work than before; but upon this point he could say nothing except that he had been making exhaustive inquiries at all the Metropolitan hospitals, and had not been able to find a single record of the treatment of an in- or out-patient belonging to the building trades suffering from overwork. Seriously, he would suggest that the remuneration of clerks of works, if not uniformly fixed at a guinea a day—that might come in time—ought to be at least four guineas a week on any job up to a cost of £5,000, five guineas per week for works costing from £50,000 to £100,000, six guineas a week from £100,000 to £150,000, and a guinea per week for every additional £50,000 outlay. This would only be fair pay for the onerousness of the work entailed by watching the progress of works of such magnitude. As to the title of the association, it would be noticed that in the proposed new building contract the name "inspector" was substituted for the term "clerk of works" given in the present building contract, and so long and honourably borne by their members: the new document stipulated that the inspector should "have power to inspect and report to the architect." He protested against these attempted changes in the status and duties of clerks of works. Of late years the duties of a clerk of works had become more onerous and complicated, and he was required to be master of many additional trades, and it was a simple act of justice that improved remuneration should accompany the extension of duties.

Mr. H. V. Lancaster, A.R.I.B.A., in responding, said the position of inspector was not, in his opinion, derogatory to the clerk of works; but when the latter made himself the representative of the architect, his troubles commenced. He could not agree that the clerk of works should be paid by commission on the outlay for the building on which he acted; but thought a more equitable plan would be to proportion the salary to the ability of the man. Mr. J. E. Drower, who also replied in an amusing speech, said architects and clerks of works seemed to taken delight in their work, and they were gregarious animals, as shown by the annual dinners they arranged; but the unfortunate quantity surveyor was only too glad to put his papers out of sight when his task was ended, and was a solitary creature. In no country except the United States had there been such a breaking away from old traditions, and such a display of freshness, originality, and ingenuity as among the architects of England, and in carrying these ideas into execution they had been ably supported by their clerks of works.

# THE "BOYLE" SYSTEM OF VENTILATION

As applied to SEWERS (TOWNS).

- A.A. Boyle's Patent "Air Pump" Ventilator. (Upcast).  
 B.B. Upcast Shaft connected with top of Man-hole or Sewer, carried up against highest adjacent building.  
 C.C. Boyle's Patent Downcast Ventilator, for catching the wind from every quarter and driving it down the Shaft into the Sewer, which is divided into sections, each about 300 feet in length, by Boyle's Triple Flight Flap valves E.E.  
 Each section is ventilated separately.  
 The sizes of the ventilators and diameters of pipes are determined by the size of the Sewer.  
 F. Connection of Branch Sewer with Main Sewer.  
 G. Section of Branch Sewer connected with Main Sewer.

He could not understand how and where clerks of works were trained, except it was in preparation for the examinations of that association, and he certainly thought Mr. Dashwood had made out a good case for improved remuneration for his members.

Mr. J. Brady, editor of the *Clerks of Works' Journal*, proposed "The Worshipful Company of Carpenters," remarking that the company provided them with a home in their hall, and also invited the president and secretary to take a

practical part in these examinations. The toast was acknowledged by Mr. H. Phillips Fletcher, A.R.I.B.A., who eulogised the efforts of the company to promote technical education and the progress of the craft, and emphasised the necessity for compulsory registration for architects.

In proposing the toast of the evening, "The Clerks of Works Association," the chairman said he fully concurred in Mr. Dashwood's desire to raise the salary and status of his members, and thought the proposal to remunerate the clerk of

works by a progressive scale, according to the cost of a building, a very fair one. Those who lived in glass houses should not throw stones, and he could not understand Mr. Lanchester, as a member of a profession paid by commission on outlay, objecting to a like method of payment being applied to clerks of works. He thought the proposal in the new building contract to alter the title "clerk of works" to "inspector" quite unnecessary. With the toast he coupled the name of the president of the Association, Mr. W.

Baker, who briefly responded. Other toasts were: "The Visitors," given by Mr. J. Spooner, vice-president, and acknowledged by Mr. Howard J. Colls; "The Press," proposed by Mr. E. Woodthorpe, F.R.I.B.A., and replied to by Mr. W. T. Plume; "The Hon. Treasurer, Mr. John Oldrid Scott," given by Mr. S. Green, and acknowledged, in the absence of Mr. Scott, by Mr. King; and "The Chairman," proposed by Mr. B. E. Nightingale, and to which Mr. Seth-Smith replied.

#### OBITUARY.

WE regret to notice the death, on the 5th inst., at Baron House, Mitcham, Surrey, of Mr. JOSEPH HURST BOOBYER, of that address, and 14, Stanhope-street, London, in his 79th year. Mr. Boobyer was the head of the well-known firm of builders' ironmongers, the name of which has for more than two hundred years been familiar to our readers and their forbears; and the sterling reputation of which for integrity and enterprise has been so ably maintained by him and his survivors.

#### CHIPS.

During the gale on Sunday night a massive portion of the old castle at Neath, Glam., 30ft. high, and weighing about 100 tons, fell into the street. Fortunately, no one was near at the time.

The annual dinner of the Bath Master Builders' Association was held on Tuesday week, and was very numerously attended. The president, Mr. Councillor J. Harvard, occupied the chair.

It has been decided to instal the electric light in St. Paul's Cathedral. The necessary sum, which will not amount to less than £5,000, has already been raised.

The Board of Trade has appointed Mr. J. Arthur Wallington, of Basingstoke, as surveyor and umpire to their railway department.

A faculty has been issued for the erection of a stained-glass window in the parish church of East Malling. The artists are Messrs. Heaton, Butler, and Bayne, of Garrick-street, W.C.

The demand for investments at Tokenhouse-yard Mart was maintained last week, and good prices predominated. The most important lot submitted during the week comprised an area of 18,000ft., close by Farringdon-street Station, which, however, failed to reach the reserve of £185,000 placed upon it. The returns for the week altogether amounted to £218,949, exceeding the corresponding week in last year by over £170,000, but of this amount £163,000 is attributable to gas stock.

Col. W. R. Slacke, R.E., Local Government inspector, conducted an inquiry at Bristol on Friday with reference to an application by the corporation for a provisional order to empower them to acquire lands in White Ladies-road, St. Luke's-road (Bedminster), Ashley Grove-road, and Woollam-street (Easton), for purposes of street improvements.

A thousand pounds a foot was offered and refused at the Auction Mart, Tokenhouse-yard, last week for a freehold property adjacent to the City, situated in Cowcross-street, with an area of 18,000ft. A portion of the property is covered with buildings bringing in a rental of £1,160 per annum. The biddings commenced at £100,000, and after reaching £181,000, it was announced that the property was not sold.

The arbitration proceedings in connection with the compulsory acquirement of the Yeovil Gas Works by the corporation of that town took place last week, at the Westminster Palace Hotel, London, concluding on Thursday evening. Sir George Bruce, C.E., acted as umpire, the arbitrators being, for the company, Mr. A. W. M. Valon, C.E., and for the corporation, Mr. H. Stevenson, C.E. After hearing counsel's speeches, the umpire said he hoped to make his award by the 31st of March.

Mr. J. E. Willcox, C.E., Birmingham, at a meeting of the rural district council on Saturday, submitted plans, &c., for a supply of water to the village of Guiting Power. The cost was over £1,000. Members pointed out that only some eighteen cottages were affected, their centric worth being little more than the estimated outlay on the supply, but eventually the plans were adopted, subject to the approval of the Local Government Board.

Mrs. Holl, widow of the late Francis Holl, A.R.A., engraver, and mother of the late Frank Holl, R.A., died on Friday at 8, Cadogan-gardens, S.W., aged 78 years. Mrs. Holl was a younger daughter of the late Commander Dixon, R.N., who served on board her Majesty's ship *Victory* at the battle of Trafalgar.

## Building Intelligence.

**BATTERSEA.**—A new hall which has been added to the Polytechnic at Battersea, from the design of its architect, Mr. E. W. Mountford, F.R.I.B.A., was recently opened by Mr. Balfour. The hall occupies a space at the east end of the Polytechnic ground left vacant for it in erecting the main buildings, with the style of which it is in harmony, though somewhat more severe in character. It is built of red brick and Bath stone. Internally the hall is 85ft. long and 56ft. wide, while the crown of the arched ceiling is 43ft. above the floor. Behind the platform are three rooms which, when not required for purposes connected with the hall, will be used for music classes, and underneath are two workshops for masons' and plasterers' work. The gallery extends across the end of the hall opposite the stage, and will accommodate 180 people according to the County Council regulations, the body of the hall accommodating 780, thus giving a total seating capacity with the platform of about 1,020. The hall is to be used for examination purposes, for meetings of students, and for the holding of popular concerts and entertainments and exhibitions. Mr. Henry Holloway was the builder.

**DRUMMOND CASTLE.**—At present a large staff of workmen are engaged rebuilding the west wing of Drummond Castle, the residence of the Earl and Countess of Ancaster. The portion of the castle extends from the front turret entrance door in the courtyard south towards the famous gardens. In this wing were formerly situated the staircase and dining-room, with eight or ten bedrooms, which have all been removed. A new block of three stories in height is being erected in its place, which also occupies a part of what was the courtyard near the garden entrance. The greater portion of the ground floor of this new wing is to be occupied by a large dining-room and a new staircase, with windows looking into the gardens and courtyard. A new library is to be placed on the drawing-room floor above the dining-room, also looking on to the gardens; while the whole of the remainder of this floor and the top floor will be taken up with bedrooms. A new billiard-room has also been formed on the ground floor. The new wing has been designed in the same style as the present castle, and has corbelled turrets on the south angle overlooking the gardens. The buildings adjoin the ancient Castle of Drummond, which dates from the 15th century.

**IPSWICH.**—The corporation of this town, at their meeting on Wednesday week, decided to carry out a number of improvements at an estimated expenditure of nearly £20,000. These include the widening of the eastern section of the narrow part of the ancient main thoroughfare known as the Butter Market, at a cost of £5,500; the widening of St. Peter's-street, leading to Stoke Bridge, to 26ft., at a further outlay of £6,150; to extend the museum and free library in High-street over land recently acquired at the rear of the premises, with entrance from St. George's-street, at a cost of £3,000. They also approved, in principle, of the purchase of the tramways, with a view of working them by electric traction, and of the erection of a public abattoir, appointing a committee to report on the probable outlay on the latter, the sum spoken of being between £5,000 and £6,000.

**NORWICH.**—The improvements to the Sessions Court at the Guildhall, set on foot last year, are approaching completion. The old stone flagged floor has been replaced with one of wooden blocks. The flags were found to have been laid on thin lime concrete on beams which were quite rotten. A new floor of steel girders on concrete covered with wood blocks was accordingly put in. Double windows have been fitted on the north side of the court, and a dingy old curtain at the back of the gallery has been replaced by a panelled screen. The cleaning and painting of the court has been carried out thoroughly. The canopy above the seat of justice has been renovated, the ironwork of the galleries has been touched up with gold, and the panel in the centre of the west wall has been cleansed from a dozen coats of varnish and dirt, revealing a well-painted achievement, one of which any court might be proud, of the Royal Arms of the reign of George II. This restoration was due to Mr. Dimmock, of London-street. New fittings, including dock, witness-stand, and

reporters' tables, have been provided, and seats constructed for the general public. At each entrance oak screens have been provided. The work has been carried out under the direction of Mr. Arthur E. Collins, the city engineer, by the sole contractors, Messrs. Downing and Sons, of Victoria-street, Norwich.

**PETERBOROUGH.**—The process of taking down the south-west gable of Peterborough Cathedral front has just been completed down to the main string-course. The various stones are now lying on the inclosed green sward of the Precincts, with the exception of the wheel window, which has been retained upon the scaffold. The stones are much larger than were those of the north gable, and in far better preservation. It appears that very little new stone will have to be used. St. Andrew is now in closer company with his stony companions, for they are all in congregation at the base of the west front. Viewed so nearly, the statues are very grim and worn; but many are excellent carvings. The whole of the figures will be immersed in a solution of lime, and after a visit has been paid by Mr. G. F. Bodley, A.R.A. (the architect), the work of re-erection will immediately commence. On its completion the central gable will have expended upon it the slight restorative work suggested by Mr. Pearson and his successor, and, this done, the façade will once again be in every respect sound.

**PIETERMARITZBURG.**—Numerous and costly Government buildings are just finished, in progress, and about to be proceeded with in Maritzburg. Col. Hime, the Minister of Lands and Works, has purchased about four acres of the College Grounds just beyond Alexandra Bridge, upon which will be erected the new Native High Court. The specifications for the new Drill Hall are almost ready, and the work will soon be put in hand, and tenders are invited for the Legislative Council buildings. Large railway workshops are to be erected near the Zwartkop-road. At the Natal Government Asylum extensive additions are in progress. These consist of a new dining-hall, laundry, recreation-room, and other offices, besides the installation of the electric light. In addition to those works, the Colonial Armoury has just been increased by the erection of a new hall and quarters for the armourer, and Maritzburg College is being increased by a new and elegant hall. The Colonial Offices are to have a third story added to them. Altogether the new works just mentioned will mean the expenditure locally of £75,000.

The draft scheme and order of the Charity Commissioners for the foundation of endowed schools by the Haberdashers' Company, under Aske's Charity, just published, provide that amongst other schools one school shall be established at West Hampstead for about 300 boys, to be called the Haberdashers' Aske's Hampstead Boys' School, and that the cost of the site and buildings for the school are not to exceed £32,000.

Emmanuel Church, Exeter, has been placed in the hands of John King, Limited, engineers, Liverpool, for the entire warming and ventilation by their latest improved hot-water apparatus and patent tubular exhaust ventilators.

A deputation from residents in New Wortley waited upon the sanitary committee of the Leeds Corporation on Friday, and complained of the state of things connected with half a dozen cottages owned by Alderman Knowles. They stated that the tenants of the property, in order to reach the closets, had to go sixty yards along a public thoroughfare, and thence through a dark passage only 25in. wide. It was further complained that the accommodation was insufficient, there being only two closets for eight houses—the six belonging to Mr. Knowles, and two to another owner. The committee passed a resolution ordering a notice to be served upon the alderman, requiring him without further delay to remedy the present unsatisfactory condition of affairs.

At Partick Dean of Guild Court on Friday linings were granted for the erection of tenements aggregating in cost about £50,000.

Mr. E. Sandford Fawcett, A.M.I.C.E., an inspector of the Local Government Board, held an inquiry on Feb. 9 at Clayton-le-Moors into the application of the urban district council for sanction to borrow the sum of £5,075 for purposes of paving and other improvements on portions of the main roads within the district. Mr. A. Dodgson, surveyor to the council, explained the details of the scheme, after which the inspector viewed the sites of the respective works.

## PROFESSIONAL AND TRADE SOCIETIES.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—At the last meeting of this body, held in the Royal Institution, Edinburgh, Mr. Thomas Ross, president, in the chair, a paper was read by Mr. Thomas A. Croal, entitled "Some Words about Edinburgh Architecture." Dealing with the placing of buildings, and the exits from public places, Mr. Croal took for his starting-point Mr. Waterhouse's comments on the site ultimately selected for the Usher Hall. Mr. Waterhouse had remarked, on the general question, that a site for a public building should be more or less surrounded by lawns and trees, as nothing, in his judgment, so much enhanced the enjoyment of fine architecture as the softening influence of neighbouring vegetation. Proceeding on the lines thus indicated, Mr. Croal reviewed the position of many public buildings in Edinburgh, first noting the beauty to the eye presented by the Register House, and suggesting that the determination of Edinburgh to preserve the north side of Charlotte-square—by the same architect—lay in the charm of its combination of a sunny frontage and the "softening influence of neighbouring vegetation." Mr. Croal indicated the Scott Monument as a prominent illustration of a building badly placed, in respect that its worst aspect was on its own proper front. The university was so placed that the best front view was obtained inside, and the Museum of Science and Art had heavy cornices to keep off the sun, and an open glass front to the cold north. Fettes College was so grandly placed that the plainness of its rear view did not offend; but many buildings existed whose back parts, although on the sunny side, were so bald as to show only deformity. Princes-street, although Glasgow folk called it "a street wi' ae side," seemed the perfection of condition for prominent town architecture. Referring to the fact announced by the Lord Provost that the new buildings in the Castle were condemned by the Commander-in-Chief and the War Secretary, Mr. Croal showed how they came as an ugly breach in what was formerly a lovely and perfect contour, and then commented on the curious fact stated at Dundee by the Marquis of Lothian that the War Office had raised the question of carving the English quarters on the Castle. The second part of the paper pointed out the dangers of exit from a number of public halls in Edinburgh, and counselled architects to keep this point well in mind. The members of the Association made their first visit for the present session on Saturday afternoon. Tolleross cable-power station was thrown open for inspection, and members were met at the depot by Mr. W. N. Colam and Mr. Cooper, the engineers for the corporation. The chimney is 180ft. high. The front of the building has been treated in terracotta and stone in a Victorian Gothic style, and the sides are of terracotta brick. The total cost will be approximately £44,000. Members then paid a visit to the Industrial Brigade Home in Fountainbridge, over which they were shown by Mr. Frank W. Simon.

**THE EXETER DIOCESAN ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY.**—The annual meeting of this society was held in the College Hall, South-street, Exeter, on Friday, the chair being occupied by the Rev. F. B. Dickenson. A satisfactory report was presented, and a balance in hand of £45 19s. 10d. was reported. The offices and committee were re-elected, with the addition to the latter of Mr. A. J. Mackay, Mr. Harbottle Reed, and the Rev. J. O. Reichel. The Rev. C. J. V. French, Mr. W. B. Harbenden, and the Rev. E. Gill were elected new members. The Rev. R. Medley Fulford read a memoir of the late Rev. J. L. Fulford. Mr. Harbottle Reed read a paper on Tintagel and Boscastle Churches.

**NOTTINGHAM MASTER BUILDERS' ASSOCIATION.**—The annual dinner of this association took place at the Albert Hotel on Friday last. In the absence, owing to illness, of the President, Mr. James Wright, Mr. Enoch Hind, a former president, occupied the chair, and was supported by Mr. W. Edgar (in the vice-chair), Ald. John Bowen, J.P., Birmingham (president of the Midland Federation), Mr. Ernest Jardine (president of the Nottingham Engineer Employers' Association), Ald. Pyatt, County Councillor W. Lewin, Messrs. J. Sulley, Chambers (president of the Leicester Master Builders' Association), Fox, Barker, J. J. Adams, T. Barlow, A. G. Bell, J. Cooper, T. Cuthbert, Crane, Eliot, Attewell, G. Fish, A. H. Gell, Gabbittass,

Goodband, J. Greenwood, Green, F. Hodson, W. J. Barton (secretary of the Association), Heighton (secretary Master Plumbers' Association), R. Morley, Maule, J. T. Norris, G. A. Pillatt, J. F. Price, W. Savage, J. Shaw, A. Vickers, J. Carr, J. H. Williamson, J. H. Spencer (solicitor to the association), J. Wright, W. Hall J. Hickinbottom, Buttler, G. Hind, J. R. Rudd, W. Appleby, T. Long, H. Haines, J. W. Shaw, J. Burton, L. Pask, T. Thorpe, Adkins, T. Woolston, T. Day, W. Hobson, J. Hotching, R. Simpson, T. Flewitt, A. Wright, J. Bryan, Walter Danks, T. Greenall, L. Lloyd, T. Salisbury, W. Watson, and others. Mr. Lewin submitted "The Mayor and Corporation of Nottingham," coupling with the toast the name of Ald. Pyatt, who suitably responded. Mr. Vickers gave "The Architects," observing that he was sorry to have to utter a discordant note, but he was bound to say they were somewhat behind other large towns in the matter of architecture. During the last few years, however, there had been great improvement in this direction, and he sincerely trusted it would continue. In proposing "Success to the Master Builders' Association," the Chairman said the association had been formed for only two or three years, but during the past year their membership had increased by 31, and the members on the books were now 99. They were all aware that they had had some differences with the architects and with the men during the year. At its beginning there was a strike with the labourers, and the bricklayers were in sympathy with them. The association had to give way because work was good; but he was sure that so long as they remained banded together they would go on progressing. The Chairman referred to the decease of two old friends of the association, Mr. Fred Messom and Mr. Enoch Kent. Mr. George Fish responded. Mr. Thomas Greenwood submitted the "National Federation and Kindred Associations," and referred to the advisability of unity in consideration of the action being taken in respect to the limitation of apprentices. The names of Ald. Bowen, J.P., and Mr. Ernest Jardine being associated with the toast. The health of "The Chairman" closed the list.

**SOUTH WALES ARCHITECTS.**—The annual dinner of the Cardiff and South Wales and Monmouthshire Architects' Society was held at the Royal Hotel, Cardiff, on Saturday evening. Mr. C. B. Fowler, F.R.I.B.A., president of the society, occupied the chair, supported by the Deputy Mayor of Cardiff (Alderman Troughton), Mr. H. L. Florence (vice-president of the R.I.B.A.), the Mayor of Newport (Councillor T. H. Howell), Mr. Lewis Williams, Mr. E. W. M. Corbett, Mr. D. T. Alexander, Messrs. J. Coates Carter, D. Morgan, M.S.A., Edwin Seward, B. Lawrence, and Mr. W. H. Dashwood Caple (secretary). Mr. W. Cooke proposed the toast of "The Royal Institute of British Architects and the Cardiff, South Wales, and Monmouthshire Architects' Society." Mr. H. L. Florence (vice-president R.I.B.A.), in responding, remarked that he had that afternoon visited Cardiff Castle, and there he saw the spirit of an artist who had produced the forms of the 13th century, and had infused into them the life and spirit of the 19th. That should be the end and aim of the architect. They were, he had found, about to put up a new series of magnificent municipal buildings in Cardiff, for which there was no parallel in the town in time past. He had called upon Mr. Lanchester and had seen the plans, and he was surprised and delighted to see how convenience and admirable arrangement in the interior had been blended with beauty and proportion in the exterior. The President also responded in felicitous terms, and expressed the opinion that young architects should, instead of settling down at once in the town, go about and get eight or ten years' experience in different parts of the country. In this way would local architecture be raised to the highest standard. He referred to the work in connection with the local society done by their indefatigable secretary, Mr. W. H. Dashwood Caple. The President closed by moving a resolution of hearty congratulation to Mr. Goscombe John on the occasion of his achieving membership with the Royal Academy. Mr. E. W. M. Corbett seconded, and the resolution was adopted with acclamation. Mr. J. Coates Carter (president-elect) proposed the local government bodies. The Deputy Mayor (Alderman Troughton), the Mayor of Newport, and Mr. Lewis Williams responded. Other toasts were "The Master Builders" and "The Visitors."

During the evening a programme of orchestral music was given, which had been designed by the president. The wording of the menu bore the heading "Specification," and the courses were happily named, "Setting Out," "Foundations," "Damp Course," "Joinery," "Walling," "Roof," "Certificates," "On Account," and "Final Certificate."

A church is about to be built for the Felstead School Mission in Royal-road, Victoria Dock, E., from plans by Messrs. G. A. T. Middleton and R. W. Carden, A.A.R.I.B.A., of 19, Craven-street, Strand, W.C. The building will be of inexpensive character, and will be seated for 460 persons. It will consist of a nave 86ft. by 30ft. without clerestory, and only 20ft. in height to roof-plates, transepts 28ft. broad and 14ft. deep, and apsidal chancel 22ft. depth, with vestries to north. The facing materials are Brown's red bricks and brown Ancaster stone for dressings.

At the Surrey County Council meeting on Tuesday, it was resolved to approve the recommendation of the joint committee of Surrey and Middlesex to increase the width of the projected new bridge over the Thames at Kew from 45ft. to 55ft. The consent of Middlesex has already been given.

Lord Russell of Killowen opened, on Saturday, new technical and art school which has just been built in Kingston-on-Thames, at a cost of nearly £10,000. The late Mr. Thomas Lanson, of Brighton, was the architect.

St. Peter's Church, Oldham, which was consecrated on June 2, 1768, was used for public worship for the last time on Sunday, and its demolition will be at once commenced. The church is to be rebuilt on the same site, but the new edifice, which is to be of stone, will be a larger one than the old. The estimated cost is £12,000.

In the case of the application on behalf of George Carter, of Great Grimsby, builder, an order of discharge from bankruptcy has been refused.

New casual wards are now being erected at Bolton, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The generous offer of Mr. Willett, a member of the Brighton Corporation, to redecorate the interior of the Royal Pavilion has created considerable interest in that borough. The Royal Pavilion belongs to the corporation, and was purchased for £60,000, and is used for entertainments, &c.

A Local Government Board inquiry was held at Morecambe on Friday by Colonel Durnford, R.E., into an application by the district council to borrow £2,900 for widening Marine-road, opposite the Midland Hotel. An application to borrow £1,200 for private street improvements was also dealt with.

Lieut.-Colonel C. A. Smith, R.E., one of the Local Government Board's inspectors, held an inquiry in Bradford on Friday into the application of the City Council for power to borrow £20,000 for the purposes of electric lighting extensions. Details of the proposed expenditure were given, and afterwards the inspector visited the electrical works of the city.

The foundation-stone of the great dam across the Nile at Assouan was formally laid on Sunday by the Duke of Connaught. The engineering works are being carried out by Messrs. Aird and Sons, of Belvedere-road, S.E., and Mr. Blue is the local manager and representative of the firm. The dam will be a mile and a quarter long, 80ft. wide at the base, and 80ft. high. It will raise the level of the Nile for a distance of 140 miles.

The city council and the docks committee of Bristol have decided to offer as a starting salary for the docks engineer, in succession to the late Mr. J. M. McCarrick, £1,000, to be advanced by annual increments of £100 to a maximum of £1,500.

Queen Anne Street U.P. Church, Dunfermline was reopened on Sunday after restoration and internal construction, including re-flooring and new roof and seats. The total outlay, including erection of organ by Messrs. Ingram and Co., of Edinburgh and London, has been about £3,600.

At Tuesday's meeting of the London County Council the tender of Messrs. J. Cochrane and Sons of £109,500 for the construction of a footway tunnel under the Thames at Greenwich was accepted. A motion by Dr. Cooper for the relaxation of the standing order relating to the erection of workmen's dwellings, by the omission of the provision that the erection of such dwellings shall entail no charge on the county rate, was, after discussion, referred to the General Purposes Committee. To the same committee was referred a proposal to erect in the portion of the Strand to be widened by the removal of the Holywell-street block statues of Chaucer and Milton.

## Engineering Notes.

NOTTINGHAM.—The Corporation of Nottingham is constructing a new road on the north side of the River Trent, between Trent Bridge and Welford Bridge, on the site of part of the "Meadows," now nearly built over. The river-side road and promenade will be from 180ft. to 210ft. wide, and about a mile and a quarter long. The foot of the bank is protected by strong piling, from which rise seven concrete steps, which in themselves will provide a safe and dry promenade, except in flood times, when they will be submerged. The promenade and road are to be above flood level, and between these and the concrete steps is a grass slope. The carriage drive is 36ft. wide; on each side there are two footpaths and a grass verge, and altogether three rows of trees. For the purpose of raising the road above flood level about 182,000 cubic yards of material will be required, all of which is being dredged from the river. The council have also acquired a piece of land of an area of about 25 acres abutting upon the new road, which will be laid out as a cricket and football ground. Another important work which the corporation have on hand is the extension of their sewage farm at Stoke Bardolph. At present the area is about 900 acres, and a provisional order was obtained last session for the acquisition of nearly 1,000 acres of additional land. The land lies contiguous to the river below Colwick, within six miles of the city, and is suitable for this purpose. The system adopted is that of broad irrigation combined with intermittent downward filtration; the whole of the land except that used as permanent pasture is underdrained. An important work has just been completed in the construction of an intercepting sewer for the drainage of the property now being so rapidly built on the Meadow Lands. This has involved the construction of about 1,220 yards of 5ft. 6in. diameter sewer and 1,430 yards of 4ft. 6in. diameter sewer; there is a siphon under the Tinker's Leen, and another under the canal. A new pumping station has been built, which is to take the place of the old one, which is now out of date and at too high a level. The new pumping station contains two boilers, 26ft. by 7ft., and two 24in. centrifugal pumping engines by Messrs. J. and H. Gwynne, Limited. A new sewer is also being constructed on the Lenton Boulevard. The Leen Valley sewer, constructed 25 years ago, is now much too small for its purpose. The new sewer for a length of about a mile is 9ft. wide by 7ft. 5in. Beyond Lenton this sewer is continued for about 2,150 yards, but is 7ft. diameter. This work has only recently been commenced, and the first portion will be completed in about twelve months. The contract for the second portion is not yet let. Nottingham has other improvements on the way, including a tramway extension scheme, the erection of a new electricity supply station, and other works. The constructive work of the electrical department is undertaken by Mr. Arthur Brown, M.I.C.E., the borough engineer, and the whole of the electrical work is in the hands of Mr. H. Talbot, the electrical engineer. Mr. Brown is also responsible for the riverside improvement, and has prepared the plans for the tramway extensions and all other works in progress.

The memorial to the late Sir J. E. Millais, P.R.A., will take the form of a statue to be erected in the Tate Gallery of British Art at Millbank. Towards the £2,000 required, about £730 has already been promised.

During excavations in the Forum at Rome eight large blocks of marble belonging to a cornice of the Temple of Julius Cæsar have been discovered. The blocks are deeply imbedded in the earth in a position which they must have occupied since their fall from the edifice.

The Estate Governors of Dulwich College have granted a site for a new Congregational church at Horne Hill.

Dr. F. St. George Mivart, an Inspector from the Local Government Board, held an inquiry at Scarborough on the 3rd inst. with reference to the application of the corporation for power to borrow £15,000 for the erection of a new infectious diseases hospital. The medical officer of health (Dr. Littlejohn) and the borough engineer (Mr. H. W. Smith) gave particulars as to the hospital. It will contain thirty-two beds, and provision is made for the reception of cases of scarlet fever, enteric fever, diphtheria, measles, &c.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXIV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., and LXXIII., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—P. S. M. and Co.—W. Allen.—H. F. G.—T. Moore.—W. Collins.

NOTES. (We do not think you can prevent him; but it is impossible to give an opinion as to ancient lights without personal inspection, and you had better take advice from a competent surveyor. It is impossible for us to advise on questions of this kind.)

## Correspondence.

### RIGHTS OF LIGHT AND AIR AND THE NEW MUNICIPALITIES BILL FOR LONDON.

To the Editor of the BUILDING NEWS.

SIR,—The present state of the law with regard to matters of light and air in building operations is one of great uncertainty and productive of much waste of time and money, and frequently seriously impedes the building enterprises of those wishing to improve or rebuild their premises, and it is very often a question whether it is not worth while to pay a sum of money as blackmail rather than have the progress of the work stopped by an injunction, and risk the heavy expenses incurred in fighting an action often based on trivial or imaginary rights.

How to deal with this question so as not to interfere with vested interests and rights, and yet at the same time facilitate building operations, may be a difficult problem: but it is not by any means an impossible one.

In Scotland these matters are dealt with by the Courts of the Deans of Guild, and it ought to be possible to adopt some similar means here. It has been suggested that a technical court should be established, and every building owner, where any question of light, air, or other easement arises, should be able to appeal to this court and arise before it all respondents who may be interested. Plans could be deposited to which all interested parties could have access, and the court would then proceed to hear the objectors and the

building owner, and decide the limit to which the building could be carried without interfering with the lights and easements of the objectors; by this means no injury would be done to the rights of either party, and the decision obtained before the building owner is pledged to his contract with the builder, would most certainly prove of invaluable service to those contemplating building, and prevent blackmailing or useless actions.

The technical court would be composed of professional men who would not require expensive expert evidence to be brought before them to determine the issue, and who would visit the premises and see for themselves. The nucleus of such a court is to be found in the Tribunal of Appeal under the London Building Act of 1894. Its numbers could be increased and additional powers given to it to charge the necessary fees for maintenance, and the whole cost of deciding between the parties would be a mere fraction of the present unsatisfactory and wasteful course of fighting a light and air action. There could, of course, be an appeal to the Divisional Court, if thought necessary, and also the building owner, if he exceeded the limits laid down by the court without first settling with his neighbours, would be proceeded against by the court, who should have the power of enforcing their own decision.

To this end the Society of Architects in November last approached the Lord Chancellor with a petition, praying that a Parliamentary committee might be appointed to inquire into the present law with regard to ancient lights, with a view to saving the large amount of moneys being expended in determining the rights of owners with regard to same, when his lordship intimated that he would give the matter his careful attention.

It is hoped that the hearty co-operation of the leaders of the professions, both architects, surveyors, and lawyers, will be given to obtaining an Act of Parliament to deal with this subject, and thus enable us, at least, to be on an equal footing with Scotland and the present new Municipal Government Bill should give a good opportunity for forming the necessary court under the central authority, the London County Council.—I am, &c.

C. McARTHUR BUTLER,  
Secretary of the Society of Architects.  
St. James' Hall, Piccadilly, W.

### LEEDS MARKET HALL COMPETITION.

SIR,—It may interest some of your readers to know a new requirement in competition. The conditions ask for four perspective drawings. I have written pointing out the unnecessary number; but the city engineer, in answer to my letter, says: "I think both the number of the perspective drawings and the scale to which the drawings are to be made are quite necessary."

I may say, 1/4 in. scale drawings are required, and, the site being very large, they would be great drawings. I wrote asking for 1/4 in. scale drawings, and it is needless to say I shall not send in a design now.—I am, &c.,

SIDNEY SMITH.

14, York-buildings, Adelphi, W.C.

### IRON AND STEEL.

SIR,—In an elementary lecture on iron and steel I made the following statement—viz., "The fracture of good wrought-iron when broken under a tensional strain gradually applied should be fibrous"; and with regard to steel, whenever rupture occurs slowly, a silky fibrous fracture is invariably the result.

This statement was questioned, and the questioner wrote to an authority in the North who has made a special study of metals with the microscope. He replied as follows:—"The term fibrous when applied to steel, seems to take a lot of killing. As a matter of fact, steel is not fibrous. It is a homogeneous material, crystalline in its ultimate structure, and gives a granular fracture. Wrought iron is also often spoken of as giving a fibrous fracture. All that can be said is that it gives a fibrous appearance in the fracture; but wrought iron is also a crystalline substance, and is no more fibrous than any other crystalline substance known to chemists."

I should like very much to know the views of others who have made a special study of this subject, for one is so accustomed to look upon wrought iron as a fibrous material, and so many books state that it is so.—I am, &c.,

SIDNEY HARRIS.

St. Giles's-square, Northampton, Feb. 13.

THE PALACE OF JUSTICE, BUDA-PESTH.—NEW PREMISES FOR EASTMAN'S PHOTOGRAPHIC MATERIALS CO., LTD.—BRONZE MEDALLIONS OF JOHN KEATS AND CHARLES LAMB.—NAVE ROOF OF WINCHESTER CATHEDRAL BEFORE REPARATION.—CHAIR FROM BISHOP'S PALACE, ST. ANDREW'S.

## Our Illustrations.

THE PALACE OF JUSTICE, BUDA-PESTH.

(For description and further sketches, see p. 226.)

THE EASTMAN PHOTOGRAPHIC MATERIALS COMPANY, LIMITED: NEW PREMISES, REGENT-STREET, LONDON, W.

THE constructional alterations, decorations, and furniture at these premises were designed by Mr. George Walton, of Bayswater, W. The finishings, such as the decorations, furniture, glass, metal work, and fittings were executed at the works of Messrs. George Walton and Co., Limited, in Glasgow, from his designs and under his personal directions. These photographs are exhibited at the exhibition just opened in Glasgow at the Royal Glasgow Institute of the Fine Arts. The hoarding in Regent-street for the Eastman Co., when the work was in progress, was designed by Mr. George Walton, and consisted of a series of upright posts tapered on front side to top and painted white. The filling of common flooring boards stained a bright emerald green, the lettering being simply the plain wood without stain. The figure at end was in stencil of white, with touches of purple, pink, and black. There was some difficulty in connecting the effect of shop front between windows and doors, owing to heavily plastered front. This, to some extent, was overcome by movable cases, carrying a cornice round top of them in connection with cornice at spring of window arch. The front and window stall is in oak and metal work; the leaded lattice work is rich in material and colour; entrance, white marble step and white marble mosaic; interior ceilings are strap-moulded and painted white; the frieze, white ground, decorated in bright colours—blues, purples, and touches of pink; lower wall panelled about 6ft. 6in., and white enamelled floors; counters, and furniture are in oak. The grate and fireplace in the centre of the room are not new, but were originally there. The furniture is in oak, covered in green leather; screen is in oak with lower panels in leather, with diaper in metal. The rugs are bright in colour, and were designed by Mr. Robert Paterson, one of Mr. George Walton's assistants in Glasgow, who was successful in gaining one of the eight National Gold Medals last year at South Kensington for that design.

PASSMORE EDWARDS LIBRARY, EDMONTON: MEDALLIONS OF JOHN KEATS AND CHARLES LAMB.

THESE two charming tablets have been executed by Mr. George Frampton, A.R.A., and are the gift of the donor of the building, Mr. J. Passmore Edwards. The medallions are executed in bronze, and will be placed on Sienna marble slabs, framed by a green marble moulding on a red

brick background, and they will be affixed to the vestibule of the library. The portrait of Keats has been executed from the mask taken after death, and from the portrait painted in Rome in 1821 by his friend Joseph Severn. The likeness of Charles Lamb was modelled from the painting done at the age of 23, in 1718, by Robert Hancock, and also suggestions were obtained from the portrait by William Hazlett. Every care has consequently been taken by the sculptor to render these memorials truthful records of these two distinguished Englishmen, whose lives were intimately associated with Edmonton, where they lived. Charles Lamb died there. Mrs. Humphry Ward, on the occasion of the laying of the foundation-stone, gave a most interesting account of their history and work, and her *résumé* was gracefully supplemented by no less an authority than Dr. Garnett, the librarian of the British Museum, when he opened the buildings on the 10th of April, 1897, to the public. We published a view, with plans, of the library in the BUILDING NEWS for April 9, 1897. Mr. Maurice B. Adams, F.R.I.B.A., was the architect.

WINCHESTER CATHEDRAL NAVE ROOF.

For description see page 227.

CHAIR FROM THE BISHOP'S PALACE, ST. ANDREW'S, MDCXII.

THIS chair is in oak, of a very dark-brown colour. The turning, mouldings, and carving have been softened down by age and wear, which gives the chair a beautifully soft appearance, and is in very good condition. The seat is of pine, which may have replaced the original. The chair is now in the Edinburgh Industrial Museum.

J. DOUGLAS TRAIL.

## CHIPS.

Mr. Dennet H. Barry, F.S.I., has been appointed by the Benchers as surveyor to the Honourable Society of Lincoln's Inn.

A new window recently placed in the north wall of the chancel of St. Chad's Church, Slindon, was dedicated last week. The window is by Mr. C. E. Kempe, and consists of two lights, in which are figures of St. Paul and St. Thomas.

The parish church of Colbury, in the New Forest, is about to be underpinned and provided with buttresses, the drought of last summer, acting on insufficient foundations laid in a clay soil, having rendered the structure almost unsafe for use. Mr. Cancellor, of Winchester, is the architect for the works of repair.

The Electricity Committee of the Corporation of Glasgow agreed, by a majority, to recommend that the corporation offer £30,000 for the buildings, plant, and rights of the Kelvin-side Electricity Company. The agents of that undertaking have stated £48,000 as the price at which they are willing to sell.

At Burmarsh Church, Kent, the tower and bells have been reopened after restoration and addition. A new tenor and treble have been added to the three 14th-century bells, and the work has been carried out by Messrs. Mears and Stainbank, of White-chapel.

The urban district council of Newtown, Mont., have adopted plans for a free library, prepared by Mr. Edward Powell, architect. The building, which will cost about £1,500, will occupy the site of the King's Head Inn in the centre of the town.

A chancel screen of open carved oak work, which has been designed by Mr. A. Scrivener, of Hanley, and executed by Messrs. Overfield, of Leek, was dedicated at St. Luke's parish church, Leek, on Sunday week. The screen consists of an open central arch, surmounted by a vine, and terminating upwards in the cross. On either side stand two angels, two facing west and the other two east. The western angels have trumpets, the eastern a harp and cymbals respectively. There are two bays on either side the central arch, and the vine is carved in the headwork of the screen. On the lower part of the screen are two inscriptions, one facing east and the other west.

A new board school in the Ashley Down district, Bristol, was opened last week. It is situated in Tortworth and Olveston-roads, and accommodates 690 scholars in three departments. The central hall system had been adopted. The materials are local bricks, Bath stone dressings, and Bridgwater angular roof tiles, the whole of the floors being of wood blocks. The general contract was in the hands of Mr. E. Walters, of Montpellier. Messrs. W. S. Paul and James, and Mr. G. C. Laurence were the joint architects for the buildings, and Mr. S. White acted as clerk of work. The cost has been £8,500, or £9 a head.

## COMPETITIONS.

BRISTOL.—An unexpected difficulty has arisen in regard to the plans for the new public library for Bristol North. Sanction having been given by the council for the purchase of a site in Cheltenham-road, nearly opposite the Colston School for Girls, the libraries committee gave instructions that Bristol architects be invited to send in designs for the new building. Communications were forwarded to the architects whose names appeared in the Bristol Directory; but, to the surprise of the committee, replies came back from a great many that no plans could be submitted unless an assessor was appointed to judge them. The committee saw no necessity for such a departure; and members felt that, not being without experience in judging whether plans were such as they wanted, there was no justification for the responsibility being taken out of their hands. A sub-committee waited upon the representatives of the local Society of Architects, who will in due course report to their society. A meeting of the libraries committee has been held, and this body approved of the action the sub-committee had taken.

PETERBOROUGH.—At the last meeting of the city council, the town clerk reported having despatched a cheque for £20, the amount of the first premium for the Guildhall improvement designs submitted by Mr. A. E. McKewan, of Birmingham, together with a communication stating that, in view of the municipal purchase of the Broadway property, and its suggested adaptability as a site for corporation buildings, there was a possibility that Mr. McKewan's accepted plans would not now be carried out. Mr. McKewan had at once replied that this intimation much surprised him. Had he been informed of the possibility of such a development, he would not have entered the competition. In view of the acceptance of his premiated designs, he should expect to be retained as architect for the erection of any municipal buildings in Peterborough. Such a communication had clearly not been anticipated by the town council, add various opinions were expressed as to Mr. McKewan's professional claim upon the council in respect of any building operations which might in the future be instituted. Ultimately the question was deferred for a week.

The memorial erected on the site of the burial-place of Archbishop Benson, in Canterbury Cathedral, will be formally unveiled on Saturday, July 8.

The Blackman Ventilating Company have sent us an admirable little pocket notebook they are issuing, which contains an excellent memorandum book, some useful information about the company's well-known system of ventilation, and a policy of insurance good till March 1900 for the person carrying the pocket-book about him.

The Winchester Cathedral reredos is, after a long interval, again about to receive the central figure—viz., the crucified Saviour. Messrs. Brindley and Farmer are carrying out the work, and the whole will be complete on Easter Day. West's picture of the "Raising of Lazarus" has been removed from the position it has occupied since 1781. The great panel over the holy table, which it covered, will be filled with a piece of sculpture representing the Holy Family.

Two of the properties to be rebuilt under the improvement scheme just adopted by the Ipswich Corporation for the widening of the eastern end of the Butter Market are to be reconstructed from plans by Mr. E. Fearnley Bishopp, of that town. The style selected for the façades is the Later English Renaissance, to be carried out in red brick. The site will be divided up into six shops, and on the first floor will be some suites of offices. The length of the Butter Market front will be nearly 150ft.

An inquest was held at Birmingham, on Friday, touching the death of the two men, Stokes and Peaton, in the employ of Messrs. Benton, through a fall of roof timbers at Christ Church, built in 1820, and now in process of demolition. It was shown that the huge beam which gave way, precipitating the deceased and one other man to the ground, had been reduced to a state of decay by dry rot. This, however, was not perceptible on the outside, and Mr. William Hale, architect, of Birmingham, the expert called in by the coroner, would not go further than to say that the method followed in the removal of the timbers was imprudent. The jury returned a verdict of "Accidental death," and recommended that the city authorities take cognisance of the demolition of old buildings, with a view to the minimising of danger.

### QUESTIONS.

[12185.]-**Certificate.**-Shall be greatly obliged if someone will kindly give me a good form of wording the certificates one has to give a builder from time to time as the work he is doing proceeds, and when he requires part payment for the same. Also the form generally used when the work is finished, and done in accordance with the drawings and specification.—TECHNICAL.

[12186.]-**Quantity Surveying.**-Is it usual to give a separate item for plumbings to all external angles of a building? Does this include all window and door jambs, as well as quoins? Are all the four angles of a square pillar measured? I believe this item is sometimes given as "forming fair quoins."—SURVEYOR.

[12187.]-**Wet Granite Walls.**-Can any practical reader speak from experience of a thoroughly effectual remedy for drift right through walls? I have no faith in the patent liquids in such a case. Is there anything short of cementing the whole surface outside? The walls were battered, but all to no purpose against a heavy Dartmoor drift.—E. A. S.

[12188.]-**Encroachment.**-A has a piece of land on which I have recently built a shop, over the window of which there is a projecting wood cornice. B has

property standing at right angles to A's property. The cornice above referred to butts up against B's wall, but is not attached to it. B complains that A is encroaching on his rights. Will someone kindly give an opinion?—T. L. S.

[12189.]-**Society of Architects Examination.**-What are the subjects required for this examination, and where are particulars to be obtained?—PHIL.

[12190.]-**Ornamental Ceilings.**-Is there any work on this subject treating of wooden, panelled plastic, and other ceilings? How are wooden moulded ribs formed and fixed to form panels? Also, I should like to know how the plastic slab decoration is fixed. Is it necessary to plaster or board the surface, or can they be fixed direct to the joists? An answer will oblige.—A SUBSCRIBER.

[12191.]-**Architectural Tours.**-Are there any tours arranged so that a student may be able to sketch and study the chief buildings on the Continent at first hand? Books do not always afford all that is wanted—the materials, their arrangement and working, also the colours, are not mentioned—and personal inspection is of more value than whole pages of description.—A STUDENT.

### REPLIES.

[12172.]-**Wood-Block Floors.**-One of the best wood-block floors I have seen is the "Fawcett," in which steel tongues are introduced, running through the corners of each block, by which they are held together and prevented from springing. See notice in last week's "B.N."—G. H. G.

[12173.]-**Wet Over Shop.**-Are you quite sure that provision was made for draining away the water from the lead gutter in cavity? Are the flashings over shop cornice watertight? The water may perhaps come in at A (see sketch), that is, between the flashings and the end

of gutter. Your best plan would have been to have built in the lead gutter in one large piece extending over cornice, as sketch, B.—ALLEN T. HUSSELL, Hfracombe.

[12176.]-**Wet Over Shop.**-The lead shown in section does not go through the whole outer-wall thickness, hence it does not intercept percolation of water. It should also have a fall on each side to prevent any dampness coming through. Sometimes mortar droppings fill up the cavity and allow the wet to pass through. I should advise the lead to be dressed up a course or two within an inch of the outer thickness, and then bent horizontal again and passed through the inside thickness of wall. It is a good plan also to put a sheet of lead through the whole thickness of wall above the cover-stone. There is little doubt one cause of the wet running down on the inside of hollow is that the lead channel, as shown, connects the two thicknesses, the water overflowing the lead channel wetting the inside brickwork. But the chief cause of the mischief is that the lead does not go through the outer  $\frac{1}{4}$  in. of wall, the water therefore is absorbed downwards, and trickles down, round, or

through the cover-stone. Remedy: Rake out joint above cornice of shop, and insert  $\frac{1}{4}$  in. lead, and turn up against outer wall in cavity.—G. H. G.

[12177.]-**Area of Brick Piers.**-Square length of a side, or multiply by itself. The length of diagonal is found by multiplying length of side by square root of 2, which is 1.41, 14 in decimals, or 1.5.0 in duodecimals. Area of oblong by length into breadth; length of diagonal by adding squares of two adjacent sides, and extracting square root. If  $l$  = length  $b$  = breadth, then  $\sqrt{l^2 + b^2}$ , &c. Area of polygon: Divide into triangles, drop perpendicular lines from opposite vertices on these lines, and find areas of triangles by that for trapeziums. Say top and bottom = 5ft. and 7ft., distance vertical being 12ft.;

then— $\frac{5 \times 7}{2} \times 12$ , or 72sq.ft.

Area of triangle, say 12ft., 15ft., and 19ft.—

$= \sqrt{23 \times 11 \times 8 \times 4} = 4 \sqrt{506}$ , or 90sq.ft.

See Dobson and Tarr's "Measuring" (Crosby Lockwood and Co.) A rod of brickwork averages 15tons in weight, made up as follows:—4,352 bricks, 1 cubic yard lime,  $\frac{3}{4}$  cubic yards sand, equal to 235 cubic feet of bricks, and 71ft. of mortar (four courses to a foot) not allowing for waste.—REGENT'S PARK.

[12177.]-**Area of Brick Piers.**-The area of piers may be calculated by dividing the total load on pier, divided by the safe load per super. foot of concrete, which will give the feet superficial of footings, the square root of which will give side of same.—G.

[12178.]-**Damp.**-Try a solution of "Fluate," or Szechemey's liquid. The cost may be obtained by writing to either firm. The former is supplied by the Bath Stone Firms, Ltd.—A. T. O.

[12179.]-**Flooring.**-Such a floor as described, of 9in. planks placed on edge, laid on main beams and nailed, would make a very strong and fire-resisting floor. I believe for a floor on which heavy machinery is placed, and which has to stand vibration, this plank-on-edge floor will be found all that has been said of it. Insurance premium will be reduced, and the wear to machinery will be lessened. There is no doubt about the strength and stiffness of such a floor, if the main girders are placed at ordinary distances apart.—G. H. G.

[12181.]-**Gas-Fires.**-The only gas-fires, in my opinion, permissible in any room where health is valued are those built up with asbestos in the ordinary grate, from which the noxious products can escape by the chimney. These are not economical, nor are they "healthy," but they dry the air in the room less than any other, and they are clean and very convenient. The best forms are Verity's and Fletcher's. Verity's is the dearest; but I like it the best. Fletcher's is cheaper, but the "fuel" required is dearer. Verity's is a sort of firebrick box of the shape of a tin-leaf, into which a Bunsen burner plays, the jets of gas escaping through holes among the lumps of fireclay and asbestos piled upon the grate. I have it in my bath-room, billiard-room, and study, and can speak well of it. My wife insisted on having it taken out of the drawing-room, because she said it always gave her a dry throat. Have nothing to do with any gas-stove without a flue, or which has a stove-pipe out in the room. If you have Verity's or Fletcher's, or any other of the same sort, be sure you have plenty of gas behind them. The ordinary gas-pipe which supplies your burners is not big enough. The one great disadvantage in London with gas-fires is that the gas companies will not put on enough pressure in the cold mornings or on Sundays. In the afternoon when you have got warmed up they put on plenty. In frosty, foggy weather, too, such as, thank goodness, we have not had much of this winter, the gas products freeze in the pipe, and you very often cannot get a fire worth calling such.—KAPPA.

[12182.]-**Preserving Wood.**-Mostly by fan work, hot or cold air, stove work, open air. There is a fresh arrangement of late by putting timber into a solution of 100 gallons, say, adding, borax 10 per cent., resin, 5 per cent., soda  $\frac{1}{2}$  per cent. Having electrode at top and bottom, when contact is made the sap rises to surface, and the other materials are absorbed by the wood.—REGENT'S PARK.

[12182.]-**Preserving Wood.**-"J. J. S." should try the patent wood preservative, "Carbolineum Avenarius," registered, which enters into pores of wood by its own action. For wood plates, bond-timber joists, &c., it is well suited, and I believe it has been largely used by builders and others. Apply to Peters, Bartsch, and Co., Queen-street, Cheapside, or Derby.—ARCHITECT.

[12183.]-**Painting Plaster Walls.**-If "A. B." puts on a coat or two of oil-paint, it will, no doubt, do a little good. The oil should be boiled in the first coat, or a first coat of boiled oil and red-lead will be better. I should be inclined to try some of the advertised stone liquids, or the Bath Stone Firms' "Fluate" before painting. Stucco work ought not to be painted. Houses so treated only look decent for a year or two, and then the coating peels off and becomes dirtier than before. The walls should be thoroughly dry before painting, and this weather is the worst for the purpose. Wait till the walls are perfectly dry.—G. H. G.

[12184.]-**Foundations.**-Accidents may arise to foundations by the sinking of trenches or drains below the foundations and near the building, by sinking wells and drawing off subsoil water, or by any means by which the foundations can be undermined or disturbed. The manifestations of such interference would possibly show itself in settlements or cracks of the plaster, the dragging of wall-paper, walls cracked or out of plumb, uneven floors, &c. I know of no book treating of building near the Thames, &c.—G.

Mr. Frank Latham, assistant surveyor of Margate, has been elected as borough surveyor of Penzance.

The Hon. John Collier has completed his portrait of Dr. Welldon, which is being subscribed for by past and present Harrovians, and in accordance with the wishes of the Bishop of Calcutta it has been hung in the Vaughan Library at Jarrow.

### PARLIAMENTARY NOTES.

**SOUTH KENSINGTON MUSEUM.**-In reply to Sir C. Dilke, Mr. Akers Douglas (First Commissioner of Works) said: All the new buildings on the east side of the Exhibition-road will be devoted to the art collections. The existing science building on the east side of the road will be the only portion which will continue to be used for science purposes. The new science buildings will be erected on the west side of the road. The plans have been prepared by the architect in communication with the officers of the art and science branches, and meet with the approval of the Lord President and his department. Mr. McLaren asked when it was proposed to commence the new buildings in front of the South Kensington Museum; whether the new public offices in Whitehall and Parliament-street would be commenced as soon as the sites were cleared? Mr. Akers-Douglas said: It is proposed to commence the new buildings in front of South Kensington Museum within the next few weeks. The new public offices in Whitehall and Parliament-street will be begun as soon as the sites are cleared and the plans approved.

**HERTFORD HOUSE.**-Mr. Massey-Mainwaring asked when Hertford House, containing the Wallace Bequest, would be opened to the public. Mr. Akers-Douglas replied that the trustees hope that it may be possible to open the collection to the public at the beginning of next year. As far as his department was concerned, the whole of the works will be finished in July.

### WATER SUPPLY AND SANITARY MATTERS.

**LONDON WATER COMMISSION.**-At the meeting of this Commission on Monday, Mr. J. Restler, engineer for the Southwark and Vauxhall Company, stated that the area served by the company was 50 $\frac{1}{2}$  square miles, and the population supplied 820,000. He considered it right that the water companies should be defended against the consequences of failure to supply by reason of frost, drought, or other unavoidable circumstances. Mr. Boulnois, M.P., chairman of the West Middlesex Water Company, said that company had never experienced any difficulty in furnishing a full supply of water to its district. He explained the steps taken by the company to provide for future demands, and, as regarded the management of the London water supply, said it did not seem to him any disadvantage to the consumer that there should be eight different companies, but rather the reverse. He had grave doubts whether any real saving would be effected by the amalgamation of the companies, or by their acquisition by a single elective authority. The witness stated objections to the equalisation of water-rates over London, and to the existing sinking-fund clauses. If a policy of purchase were determined on, it should be carried through under the Lands Clauses Act. At Wednesday's sitting of the Commission, evidence in reference to the position of the West Middlesex Waterworks Company was given by the secretary and engineer of the company. Mr. Tendron, chairman of the Grand Junction Company, was of opinion that purchase would not be advantageous to the consumers. The sitting was adjourned until Monday next.

### CHIPS.

A new Baptist chapel on the Grove Estate, London-road, Lowestoft, was opened on Thursday in last week. There is sitting accommodation for 700.

Mr. Wm. Ede, builder, of Frances-street, Truro, has committed suicide by hanging himself in his tool-house in William-street. At an inquest held on the body, a verdict of suicide during temporary insanity was returned.

A new illuminated clock, showing the time upon two external dials, and striking the hours upon a large bell, has just been erected over the granary at Vaynol Park, Port Dinorwic, near Bangor, North Wales, for Mr. J. G. Duff Assheton-Smith, J.P., by Messrs. Wm. Potts and Sons, clock manufacturers, Guildford-street, Leeds, Mr. Williams, of the Vaynol Estate Building Department, having erected the tower, and carried out all the necessary builder's work. Messrs. Potts have also a large clock and bell for the New Barry Dock Offices, Cardiff, South Wales.

A chancel screen, presented to the parish church of Leamington by Alderman S. Flavel (churchwarden), was dedicated on Saturday. The screen is of hammered wrought-iron, richly decorated, and constructed from designs prepared by Sir Arthur W. Blomfield, A.R.A. It is about 26ft. high, and surmounted by Maltese cross 7ft. high, and weighing 1 $\frac{1}{2}$ wt. It forms the finishing work in the task of restoring the chancel, which Mr. Flavel commenced ten years ago. The screen is the work of Messrs. Hart, Son, Peard and Co., Limited, of Drury-lane, W.C.

## LEGAL INTELLIGENCE.

**A BETHNAL GREEN ARBITRATION.**—COLONEL WARD V. THE SCHOOL BOARD FOR LONDON.—This claim, heard in the London Sheriff's Court on Friday, before Mr. Under-Sheriff Burchell and a jury, was for nearly £20,000 compensation in respect of the compulsory sale of a site of some fifty thousand square feet in Gossett-street, Daniel-street, and Orange-street, Bethnal Green. The experts for the claimant included Mr. Edmund Farmer (Debenham, Tewson, Farmer, and Bridge-water), Mr. Eason (Reynolds and Eason), Mr. Bliss, and Mr. Dixon. On behalf of the School Board, Mr. Daniel Watney (Watney and Sons), Past President of the Surveyors' Institution, Mr. Samuel Walker (Walker and Son), Mr. Giffard, and Mr. G. A. Wilkinson gave evidence to the effect that about £11,000 would amply compensate the claimant. The jury awarded the claimant the sum of £18,000.

**RE EDWIN FAIRCHILD.**—This was an application for an order for discharge. The receiving order was made in November last, the bankrupt being described as of St. Mary's-road, Harlesden, surveyor, and it appeared that proofs amounting to £17,372 had been made against his estate. No assets were disclosed, and none had been realised. The bankrupt was formerly a builder, and in 1888 he paid a composition of 1s. 6d. in the pound on liabilities amounting to between £7,000 and £8,000. Since that failure he had not been engaged in business or had any regular occupation. Mr. Registrar Hope suspended the order of discharge for two years.

**GREAT NORTHERN RAILWAY AND THE BURTON CORPORATION.**—At the Conference Rooms, King's Cross Station, N., on Friday last, Mr. J. Wigram sat as arbitrator to consider a claim of the Great Northern Railway Company against the Corporation of Burton-on-Trent for compensation for a sewer recently constructed through property of the company at Burton. The company acquired the land through which the sewer now passes in 1879, and they now claim that by the action of the Corporation they are prevented from extending their building area. The company estimated the damage at £2,251, while the surveyor of the Warwickshire County Council laid the damage at £384. The arbitrator reserved his award.

**HOUSES WITHOUT PARAPETS.**—At Bristol Police-court, on Friday, an important decision of the Divisional Court, which affects a large number of houses at St. George, was declared. A case was heard at the Bristol Police-court in May of last year, in which Edward King, builder, of the Grove, Fishponds, was summoned at the instance of the city surveyor, Mr. T. H. Yabbicom, for erecting at Glen Park, Bell Hill, St. George, in 1897, a certain house contrary to the provisions of the Bristol Improvement Act, 1847, inasmuch as he omitted to build parapets to such houses. The Bristol magistrates then dismissed the information, but on appeal the Divisional Court stated that the decision must be reversed. The Chairman stated, in pursuance of the ruling of the Divisional Court, they now convicted him, fining him £1 and costs.

**A DERBY BUILDING ARBITRATION.**—At the Surveyors' Institute, Savoy-street, London, an arbitration has taken place before Mr. Robert Vigers (the president of the Institute), between Messrs. Ford and Messrs. Bemrose (Limited), both of Derby. Mr. A. A. Hudson appeared for the claimants, and the Hon. A. Lyttelton, M.P., for the defendants. In May, 1895, Messrs. Bemrose and Co. (Limited), well-known printers, contracted with the claimants, builders at Derby, for the erection of buildings in Park-street, Canal-street, and Carrington-street, Derby, for the sum of £10,559. The architect was Mr. Ridgway, and the contract was drawn up without any detailed statement or specification, being based on eight plans and a bill of quantities, as is not unusual in the North of England. The builders, finding early in the contract that the quantities were insufficient, called in Mr. G. H. Kenwick, of Birmingham and London, a surveyor, who, after January, 1896, measured up the work done, and rendered detailed statements to Messrs. Bemrose. In September, 1896, the works were completed, and the cost, according to the measurements of Mr. Kenwick, was £15,316 1s. 1d. The sum of £8,750 had been paid on account, and the claimants now sought to recover £6,566 1s. 1d. due on the contract. The account of the builders was sent in on February 18, 1897, and though negotiations had been entered into no arrangement had been made. No money had been paid since that time. On the 1st April, 1897, the architect of Messrs. Bemrose gave a certificate that £1,530 13s. 5d. was the amount due, with the exception of four items, which were not included in the contract. The question turned on the legal interpretation of the contract, which specially prescribed that no alteration or variation should invalidate the contract, and that at the conclusion the architect should certify the sums due for payment. Mr. Kenwick was examined. He said he had been for 20 years a

quantity surveyor. He had measured up the work on Messrs. Bemrose's premises. He had been 36 days there, and, charging at the rate of the schedule of prices in the contract, he found the cost of the works had been £15,316 1s. 1d. The quantities supplied are, on the whole, short in every trade, though there were some exceptions in which the quantities supplied were not required, and for which he had given credit on his account. In cross-examination, witness said he had not separated the items in the contract from what might be considered extras. He had only, as he was instructed, measured up all the work, and charged for what had been done. His view was that the bill of quantities was simply a schedule of prices that the builders were to be paid, *quantum meruit*, for all the work done at that scale. Mr. Lyttelton, for Messrs. Bemrose and Co., contended that the claimants had, as a matter of law, proceeded altogether upon a wrong basis. They had measured up and charged for the whole building independent of the contract. At the very outside they were only entitled to the extras at the contract price. Mr. Hudson said if there had been a proper specification that might be so; but the quantities given were not sufficient to erect the building. Considerable legal discussion arose on this point. Ultimately Mr. Hudson stated that, at the request of the arbitrator, Messrs. Ford would prepare an account showing the difference in the quantities in the contract and the work done, and all the alterations and variations, with any difference in the contract price; and for this purpose the proceedings were adjourned for one month. The claimants agreed to render their statement of claim within 14 days.

**THE VALUE OF LAND AT KILBURN.**—The Under-Sheriff and a special jury sat at the North London Hotel, Kilburn, on Friday, to hear the case of "Cave v. the Metropolitan Railway Company," a claim for compensation in respect of the compulsory sale to the company of a strip of land at Kilburn held by the claimant on a building lease from the Ecclesiastical Commissioners. Professor Bannister Fletcher valued the land in question at £2,867. Mr. E. H. Bousfield (Messrs. Edwin Fox and Bousfield) estimated the total compensation payable to the claimant at £2,337. On behalf of the railway company, Mr. James Green (Messrs. Weatherall and Green) expressed the opinion that the apportioned ground rent of the land taken by the company was £15 per annum, and this capitalised at 22½ years' purchase amounted to £337 10s., which he deferred for seven years on the 4½ per cent. table, giving £248, to which he added the customary allowance of 10 per cent. for compulsory sale, making £272. Among the experts engaged on behalf of the company were Mr. A. R. Stenning and Mr. C. W. Willoughby (Messrs. Weatherall and Green). The jury awarded the claimant £625 as compensation.

**FRANCIS MORTON AND CO., LTD.**—A second and final dividend of 4s. in the pound (making, with the previous payment, 7s. in the pound) has been declared, payable on Monday last, or any subsequent day, between the hours of ten and three o'clock.

## CHIPS.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied their patent Manchester grates to the new cottage hospital, Ramsbottom.

In the case of Arthur Simpson, of Leeds, estate agent, surveyor, and valuer, an order for discharge from bankruptcy has been conditionally granted.

Col. W. R. Slacke, R.E., inspector of the Local Government Board, held an inquiry at the Guildhall, Bath, on Friday, into the application of the town council for a provisional order, amending the Bath Act, 1870, so as to enable the corporation to borrow additional moneys for the Monkwood reservoir. The town clerk explained that the loan for these works, which were completed in 1897, was for £29,000. There was an excess of £7,270 1s. 1d., the total cost of the reservoir being £36,270 1s. 1d. Mr. C. Gilby, the waterworks engineer, described the construction of the reservoir, and how the extras were incurred.

Before the Lord Chief Justice, on the 9th inst., in the Queen's Bench Division, Mr. A. Lucas, an art publisher, sued the Great Central Railway Company to recover £875 damages for injury to two houses at Marlborough-hill, St. John's Wood, caused, as he alleged, by the works in connection with the new line to London. There had been subsidences, and the result was cracks in the walls and other injuries to the houses. The defendants said the damage was in no way brought about by the construction of the railway. The jury awarded the plaintiff £250.

At the Derby Bankruptcy Court George Brough, builder, applied for his discharge. He had paid a dividend of 8s. 7d. in the pound, but it was stated that he had not produced to the Official Receiver all his books of accounts. His honour suspended the discharge for three years.

## Our Office Table.

THE private view of the seventy-third exhibition of the Royal Scottish Academy will take place at the Mound, Edinburgh, to-day (Friday). This year the old controversy as to what is to be done with the work of the architectural members and the other black-and-white work has been compromised, the *Scotsman* remarks, by allotting a certain amount of wall-space in the first octagon to the architectural members of the Academy, and by resolving to hang in this gallery, where the water-colours are also placed, the best drawings by outsiders. The rest of the black-and-white work is hung in the small octagon. Among the works on loan are two by Whistler, the one entitled "A Piano Lady," and the other "The Thames in Winter." There is an example of the work of an American artist resident in Paris—Mr. John W. Alexander; a large sea piece by the late Henry Moore (from the Manchester Corporation Art Gallery), called "Mounts Bay"; and there are also hung works by Alma Tadema, David Murray, Tom Graham, and Byam Shaw. The President (Sir George Reid) sends three portraits—a half-length of the Marquis of Tweeddale in archer's uniform—a companion picture to that painted by the late Sir John Millais of the Marchioness of Tweeddale, and exhibited also in the Royal Scottish Academy; a half-length of Mr. W. Wybrow Robertson, of H.M. Office of Works, presented the other day to the Merchant Company by subscribers; and a full length of Sir William Henderson, ex-Lord Provost of Aberdeen, intended for the municipal collection. Mr. Guthrie shows his portrait of Mr. J. J. Burnet, A.R.S.A., architect, Glasgow; Mr. Lavery sends an equestrian portrait of Mr. Cunningham Grahame; Mr. George Henry, a figure-picture; Mr. Lorimer, "The Ordination of the Elders"; Mr. G. Ogilvy Reid, a large picture of Prince Charles Edward escaping from the mainland in a fishing cobbie. There are landscapes by Mr. Thorburn Ross, Mr. Robert Burns, Mr. James Paterson, Mr. John Smart, Mr. Beattie Brown, and Mr. A. K. Brown; portraits by Mr. Arthur Melville, Mr. Henry Kerr, and Mr. R. Brough. Mr. Hole sends an altar-piece. The water-colours include drawings by Mr. Tom Scott, R. B. Nisbet, and Mr. Marjoribanks Hay.

THE "Waddesdon Bequest" to the nation will necessitate a considerable rearrangement of part of the collections in the British Museum. The only condition attached to the bequest by the late Baron Ferdinand Rothschild is that the collection shall be kept together in a room to be known as the Waddesdon Room, but, owing to the crowded state of the galleries, the museum authorities have had some difficulty in finding a suitable exhibition gallery for the many objects included in the bequest, the first portion of which has now been received at Bloomsbury. It is proposed to set aside the Anglo-Roman Room for the purpose, space for the antiquities at present exhibited therein, which illustrate the Roman occupation of Britain, being found elsewhere. It will be some months before the collection can be seen by the public.

THE Metropolitan Asylums Board, at their meeting on Saturday, adopted a resolution declaring that every architect employed by the managers should be, as a general rule, engaged under an agreement sealed by the board, and a draft agreement with an architect, submitted by the works committee, was approved and adopted as the basis of future agreements with architects, and upon the understanding that the actual agreement entered into should be settled in each separate case by the board's solicitors. It was explained that the committee had included in the draft agreement every condition that could be properly put in for the protection of the interests of the managers and of the public, particularly in the matter of expenditure. Mr. Hilton Johnson, who was for seven years a managing engineer and electrician in the service of the Great Northern Railway Company, was appointed assistant engineer to the board at a salary of £300 a year, with travelling expenses.

THE Improvements Committee of the London County Council reported on Tuesday that they have received a letter from Mr. H. W. H. Palmer, stating that he has instructions to dispose of the unexpired lease of the Olympic Theatre in Wych-street, a property required by the Council in carrying out the plan of the new

street from Holborn to the Strand. The lessee holds for an unexpired term of 51 years from December 25, 1898, at a rent of £2,250 per annum. The agent acting for the lessee has expressed the willingness of his client to accept for his interest in the property the sum of £12,000, which the committee consider to be a reasonable amount. They are advised by the valuer that if the Council neglect this opportunity, the property will undoubtedly fall into the hands of a speculator, with the almost certain result that a few months hence the Council will have to pay a largely increased amount. The valuer estimates the saving to be effected by purchasing immediately at no less than £25,000. The committee say they have no hesitation in advising the Council to take steps to save so large a sum. The recommendation will not be dealt with until next Tuesday, under the operations of the Standing Orders.

A RECENT voting contest was, says the *Canadian Architect*, held by the readers of the *Brochure Series of Architectural Illustration* to determine which were the eight greatest façades in the world. The "greatness" was to be considered from a purely architectural point of view, not from that of historic or other interests. No limitations of style or period were imposed. The contest resulted in the choice by consensus of the following façades, the order of preference being indicated:—(1) Notre Dame Cathedral, Paris; (2) The Parthenon, Athens; (3) The Opera House, Paris; (4) St. Mark's Library, Venice; (5) St. Peter's, Rome; (6) Amiens Cathedral; (7) The Farnese Palace, Rome; (8) The Ducal Palace, Venice. The selection and its order are curious and unexpected from an English standpoint, and it is strange that the cathedrals of Peterborough and Wells are not even located.

MR. G. A. T. MIDDLETON and R. W. Carden, A.A.R.I.B.A., have organised a sketching tour for architectural students to Italy at Easter. The party leaves Harwich on Saturday, March 25, and, proceeding via Hook of Holland, Cologne, Basle, and Milan, will visit Verona, Venice, Bologna, Ravenna, Florence, and Rome, returning via Pisa, Genoa, Pavia, Chiasso, and Basle, and arriving at Liverpool-street Station from Harwich on Tuesday, April 18. The inclusive cost of the twenty-five days' tour, which is arranged for a working and sketching party, will be thirty guineas. At Whitsuntide Mr. Middleton will conduct a similar party through Holland.

#### MEETINGS FOR THE ENSUING WEEK.

**MONDAY.**—Carpenters' Hall. "Terracotta," by Professor T. Roger Smith, F.R.I.B.A. 8 p.m.  
Royal Institute of British Architects. "Municipal and Public Libraries," by J. M. Brydon and F. G. Burgoyne. 8 p.m.  
Surveyors' Institution. "The Management and Valuation of Brickfields," by J. L. Crouch. 8 p.m.  
Society of Arts. "Cycle Construction and Design," Cantor Lecture, No. 1, by Cyril Davenport. 8 p.m.  
Liverpool Architectural Society. "Some Burgundian Churches," by Professor F. M. Simpson. 6.30 p.m.  
Leeds and Yorkshire Architectural Society. "Steel Construction in Buildings," by Professor Goodman. 6.30 p.m.  
**TUESDAY.**—Institution of Civil Engineers. Discussion on "Lake Superior Iron Ore Mines." 8 p.m.  
Society of Arts. "Persian Trade Routes," by A. Hotz. 8 p.m.  
Northern Architectural Association. Annual Social Gathering. 7.30 p.m.  
**WEDNESDAY.**—Society of Arts. "Electric Traction and Its Application to Railway Work," by Philip Dawson. 8 p.m.  
**THURSDAY.**—Society of Architects. "Lincrusta Walton," by F. Scruby. St. James's Hall, Piccadilly, W. 8 p.m.  
**FRIDAY.**—Birmingham Architectural Association. "The Advantage of Being An Artist," by H. B. Cresswell.

## The Society of Architects.

Founded 1884. Incorporated 1893.

The FOURTH ORDINARY MEETING of the Society of Architects for the Session 1898-99 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, February 23rd, 1899, at Eight p.m., when a Paper will be read by F. SCRUBY, Esq., on "LINCRUSTA DECORATION."

ELLIS MARSLAND, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.

The builders of the clock-tower at Wainfleet are Messrs. Turner and Sons, of Wainfleet, and the design was furnished by Mr. J. B. Corby, architect, Stamford.

## Trade News.

### WAGES MOVEMENTS.

**BARNSELY.**—The members of the Barnsley Building Trades Federation threaten to lock-out the whole of the Trade Union labourers in their employ. In September the plasterers employed by Mr. Lindley struck work because material was being obtained from a firm at Mirfield which employed a man who had failed to pay a fine imposed by the National Union of Plasterers. This was settled, but the Barnsley Labourers' Union imposed a fine on a labourer who had continued to work for Mr. Lindley when the strike occurred. The man would not pay the fine, the labourers struck, and Mr. Lindley's shop has been idle ever since, as the plasterers cannot work without labourers. The Federation, having failed to obtain a settlement, have given notice that if the objection against Mr. Lindley's shop is not removed by to-morrow (Saturday) they will lock-out all the Trade Union labourers in their employ.

**NORTH WALES SLATE TRADE.**—At the Carnarvon-shireslate quarries, particularly those at Bethesda and Llanberis, business keeps extremely brisk, and there is some difficulty in getting the output to meet the demand. In all the districts high wages are being earned by quarrymen. The sett quarries at Penmaenmawr are also very busy.

**THE PLASTERERS' DISPUTE.**—The standing committee of the National Master Builders' Association met on Wednesday at Derby to consider the reply of the Plasterers' Union to the ultimatum addressed to that body on Feb. 1. The reply was regarded as most unsatisfactory; but it was decided, in order to give the union an opportunity of reconsidering its decision, to postpone further action till after Feb. 21.

**THE SKILLED LABOUR MARKET.**—The monthly memorandum prepared by the Labour Department states that in January the state of employment underwent little change, and remained good in all the principal trades. The proportion of unemployed in the trade-unions making returns was, at the end of January, 3 per cent., compared with 2.9 per cent. at the end of December, and 5 per cent. in January, 1898. Employment in the building trades (painters and decorators and plumbers excepted) has continued good. The furnishing trades are scarcely so brisk.

### CHIPS.

On Saturday, a new Liberal Club, erected in Bolton-street, Brixham, was opened by the president of the Central Liberal Association, Mr. G. S. Bridgman, C.C., M.S.A., of Paignton. Constructed at a total cost of £700, the club includes a skittle alley in the basement, a reading-room, a billiard-room, and a games-room; also rooms for a caretaker. Messrs. Hosgood and Wills were the builders. The architects were Messrs. Bridgman and Bridgman, of Paignton.

The Leeds Board of Guardians have adopted plans by Mr. Butler Wilson for the enlargement of the central offices in South-parade, Leeds, at an estimated cost of £7,100.

An inquiry has been held at Heaton Norris by Mr. H. P. Boulnois, an inspector of the Local Government Board, touching the urban district council's application to borrow £6,407 for works of sewerage and sewage disposal and other sums for private street works.

The urban district council of Leiston, East Suffolk, have adopted plans by Mr. Miller, C.E., of Ipswich, for the sewerage of the town at an estimated cost of £3,000, and have also arranged with Messrs. Richard Garrett and Co., the well-known local agricultural implement makers, for a supply of water from their existing artesian well and tank and its distribution through the district by cast-iron mains at an estimated capital outlay of £1,000.

A Dominican Church of St. Sebastian is now in course of erection in the Gerald-road, Pendleton, Manchester. A priory, to accommodate a larger number of fathers, will soon be built according to the designs of Messrs. Sinnott, Sinnott, and Powell, of Liverpool, the architects of the new church. The church and priory buildings have a frontage to Gerald-road.

The town council of King's Lynn have just accepted a number of tenders for electric lighting amounting in all to £22,833. The installation will be carried out under the direction of Professor Henry Robinson, of Westminster.

The building trade is particularly brisk in the island of Mull, N.B., at present. Among buildings in course of construction are Salen Parish Church, a lemonade factory at Tobermory, and a mansion house at Glenborrodale, as well as a shooting lodge at Shielbridge, for all of which Mr. Donald Fletcher, Tobermory, is the contractor.

## SUPERVISION AND INSPECTION.

**A**BLE and competent designers of buildings are often twitted as being impractical supervisors; the man who can conceive and plan is frequently unable to carry out his own ideas in the best way, and this inability is not altogether due to the want of practical knowledge, but to the want of seeing things with the eye of the workman. The difference is that between the power of abstraction, or of seeing the whole effect of the masses, and that of administering in detail. Both powers are wanted in a successful architect, but it is owing to their lack of co-operation that so few men pass beyond the teaching and traditions of the office and studio. The "draughtsman-architect," if we use a compound term, is an example of the extreme of this side. He knows when a building looks well on paper, he can give details of mouldings and drawings in various materials; but he would be quite at a loss to instruct a bricklayer, a carpenter, or a smith how to execute his design to the best advantage, or to discover any defect in the workmanship when done. The fact is, the architect accustomed to office routine, engaged in directing draughtsmen and carrying out the official duties of contracts, has so very little to do with the actual operations of building that his knowledge crystallises, so to speak, into certain stereotyped modes of thought. What he may have learned while a pupil or as a student of a class as to the trades are often misleading; theorising has taken the place of real building. The clerk of works now fills the office of supervisor, and has, by his intervention, rendered it possible to bridge the gulf between modern official architecture and building. In this way the modern gap has been filled up. But it is not the old way: it leaves the architect-designer independent of the real work, and, what is more to the point, his duty as an inspector or overseer in the real sense of the term disappears.

Speaking of the Gothic architects of the 12th century, Viollet-le-Duc says, in his remarks on "Construction": "The men who cannot acquire a very broad education for want of instruction, completed by the successive observations of several centuries, are obliged to make up for that elementary poverty by the keenness of their intelligence; and being unable to rely upon documents which do not exist, they must make these observations for themselves, collect them, classify them, and form a theory from them. Experience alone guides them; it is not until later that rules are established, and it must certainly be confessed that, however complete may be the theory, however numerous and good the rules, they never succeed in taking the place of the observation based on the experience of every day." So it was during the Mediæval period. The duty of inspection was paramount, and there was no thought of intrusting the work of supervision to others. What the master of the work or the architect designed he took care to see carried out.

Supervision means inspection; but in this sense the modern architect must plead guilty. In a large and complex building it would be absolutely impossible for him to look at everything; he gives his directions to the clerk of works, sometimes to the contractor. In a still looser sense the duty is understood to be fulfilled when it is delegated to another—the instructing someone else to see that your design is carried out. But how can another person

interpret A's meaning, or see what he intended? It is impossible. As well might a painter hand over his sketch and brush to another, and ask him to finish the picture. The analogy is not quite true—a building comprises a number of materials and technical matters which a picture does not, and therefore a man well versed in construction and workmanship can supervise as well as the designer. Up to a certain point he can do so; he can detect inferior materials, and reject them; discard imperfect bond or joints in carpentry; but in many instances such an expert is quite incapable of deciding whether the usual and correct method agrees with the intentions of the architect. The methods of the trade are generally the most expeditious and easy, and if there are several ways of executing a piece of masonry or a structure of timber, that which is easiest and cheapest will in all probability be followed. The designer's intention often takes more cube stone or timber to carry it out; it is more laborious. The delegate supervisor of work seldom cares to make those finer distinctions of material that the artistic architect thinks important. Take, for instance, such qualities as those of colour in bricks and slates. Uniform colour, texture, and squareness are considered sufficient recommendations for bricks if they are well burnt and hard, whereas the architect may desire varying tints and broken colour, and bricks which are a little uneven in surface, so as to break up the dead flatness. So also with slates. Greenish or pleasantly varied tints are preferred. A few of our leading architects insist on these qualities of colour and texture; they select their own materials, direct how the jointing of brick and stonework is to be done; they avoid anything like machine labour in stone and wood, and require certain ways of jointing and planing wood, so as to develop the individuality of the craftsman.

Another view of supervision as it affects the administration of the London Building Act, or any local by-laws, may be considered. It has often been asked whether those who administer the Act in the Metropolis can carry out a thorough system of inspection of every building in course of erection or alteration, or whether the district surveyor can adequately inspect every such building in his district? Many serious mishaps and building accidents take place which favour the assumption that the supervision is not what it ought to be. The superintendence of buildings in Edinburgh, as recently reported in the BUILDING NEWS (see abstract of paper read at the Society of Architects by Mr. David Lyon in our last issue), shows how thoroughly supervision is carried out north of the Tweed. A warrant is granted by the Court when a new building has to be erected, or alteration made, the duration of which is limited to three years, or longer term if thought desirable. The Dean of Guild may renew the warrant for three years longer. To prevent the person who obtains the warrant disposing of the ground of the building or the building itself, thus transferring his responsibility to the purchaser, the Court directs that the person by whom any building is erected or altered, if other than the petitioner to whom the warrant is issued, is to be liable for the due performance of the terms. Thus one cause of difficulty experienced under the Building Act is avoided. At the commencement of the work the petitioner has to give notice of his intention to begin, and the clerk of Court hands the notice on to the master of works, with the plans deposited and the rules that have to be observed, a copy of which is attached to the warrant.

Before the building can be occupied, within a month of its completion, the builder or owner has to intimate that the building is ready for inspection, and if satisfied with it, if it is fit for occupation, and in accordance with the law, the master of works grants a

certificate to that effect. On the other hand, if the owner fails to give notice for inspection, and permits occupation, he is liable to punishment. Under this rule, it is nearly impossible to let houses before their construction and sanitary condition are guaranteed to the tenants. How many of our suburban new estate dwellings are guaranteed or even inspected? Perhaps only their drainage is looked to; but bad foundations, sites on rubbish heaps, damp walls, and imperfect roofs and fittings go unchecked. The by-laws are theoretically perfect, but are they in all cases tested by actual inspection? We do not blame the district surveyors—they have enough to do; but are they furnished with the machinery and a large staff of inspectors? This it is that insures the efficient regulation of building operations in Edinburgh. The master of works has an army of inspectors trained in various branches of the trade, who are constantly engaged in inspecting buildings and alterations, examining them to see whether the regulations of the Court have been complied with, and whether the buildings are fit for occupation. Nothing less than this last test is actually agreed to. Those who have failed to comply or have deviated from the plans sanctioned are liable to a penalty not exceeding £25, besides being called upon to take down and remove any portion of the building that so contravenes. Equally stringent is the law in respect of alterations of buildings intended to be used for habitation, not previously so occupied, or any alteration as to the mode of occupancy by which a larger number of tenants are allowed without a warrant. These are evasions which can only be discovered by a careful supervision of buildings during progress and after they have been occupied. In London the provisions of the Act in these matters are unsatisfactory. How are the rules as to conversion of buildings (sec. 211) enforced? After the building is finished there is no interference with the number of occupants or mode of division, and irregularities are tolerated which often make the law of no effect.

## MODEL SPECIFICATIONS.—LIII.

DECORATOR—DISTEMPERING, PAPER-HANGING, ETC.

**U**NDER the head of the Decorator's work may be included, not only distempering, stencilling, graining, gilding, and other processes of the painter; but art-glazing, metal-work, mural painting, wall-papering, upholstery, &c. Some of these it is difficult to describe in a specification, and the most desirable way is to obtain an estimate from decorator or glass-painter, to be selected by the architect, and include a sum as provision, or describe as p.c. (stating cost per foot).

Distempering is a good ground for ordinary decoration for walls, &c.; it has no gloss, and the work dries quickly. The architect should make a sketch of any decoration for ceiling or walls, say, to  $\frac{1}{2}$  in. or larger scale, putting in the desired colours. For setting out the scheme of ornament, cartoons are made full-size, taking care to observe the rules for any stencil patterns, so as to repeat, and that "ties" are introduced to keep stencil firm. The design is drawn on cartoon paper or board and then transferred to the stencil paper, such as the Willesden paper or stout drawing-paper. This is oiled with boiled-oil, and the paper thus prepared can be used to trace the pattern on. For stencil patterns on mouldings tinfoil is often used. For stencilling upon distemper, a fine sponge is sometimes used for applying the colour, it produces a clean, sharp effect, and the broken tones are more artistic. The colour should be ground "stout" in turpentine thinned with turps and quick-drying varnish. Some useful directions are given in

W. J. Pearce's work on "Painting and Decorating."

For decorating by hand, the cartoon or drawing of ornament is transferred to the surface by rubbing the back of drawing with red chalk and tracing over the lines with a point, or pricking off the pattern or forming a pounce. Through the needle-points powdered black or red chalk is dusted to form the outline of ornament. Stencilled decoration is also used in painted work, as well as hand-painted ornament, and this kind of work is better done *in situ*. The ornament can be done in the following manner: Lay in the pattern in a flat tint; when dry, glaze in the shadows with brown or sepia, and outline strongly.

For low-relief decoration *gesso* has high decorative capabilities, and can be appropriately employed in friezes, panels, dadoes, wall surfaces. *Gesso* is made of fine gypsum or plaster of Paris and weak glue size—the latter should not be too strong, and the ground should be of plaster. The modelling is sometimes done on stencil-plate, which is then removed, leaving a clear, sharp edge to the ornament, giving a depth of relief of from  $\frac{1}{16}$  in. to  $\frac{1}{4}$  in. Wooden combs are used for producing waved surfaces, and various other tools and methods are used to produce the modelled effects of flowers, leaves, figures, &c. Hog's-hair and camel-hair brushes are employed to apply the paste in low-relief *gesso* work; but the work must be left chiefly to the artist's own resources and manipulation. The work is durable if properly done, and can be heightened by gilding. *Gesso* low-relief decoration has been lately much revived by Mr. Walter Crane and others, and promises again to become a mode of interior decoration in which the art of hand-modelling and individuality of treatment are combined.

#### DECORATIVE GLAZING.

27. *Brilliant Cut Glass*.—The panels of vestibule and screens to be glazed with "brilliant cut" obscured plate-glass, not exceeding 4ft. or 7ft. square, fixed by screwed beads. The designs or centres to be selected by the architect.

28. *Tinted Glazing*.—Glaze the screen with pot-metal glass in approved cathedral tints, properly bedded in the rebates, and secured by copper-band to saddle-bars. Or—

29. *Quarry Geometrical Lead Lights*.—Provide leaded quarry lights in selected geometrical patterns of three or more varieties, glazed with stout-rolled cathedral plate,  $\frac{1}{16}$  in. thick, in various approved tints, with two borders, and fixing in wood frames, banded with copper ties.

Prepare templates for geometrical leaded squares or quarries, according to designs, for 16oz. or 21oz. rolled tinted glass, and fixing securely to wood frames (or cementing in stonework), with all copper bands, clips, &c.; or specify the stained-glass work to be done from designs by Messrs. Heaton, Butler, and Bayne, of Garrick-street.

We append a few clauses for decorative stencil-work and painting.

30. *Stencilled Decoration in Distemper*.—The ceilings, friezes, and wall surfaces of hall or drawing-room to be decorated in distemper from the designs and under the architect's directions, and all the materials and colours to be of the best quality. Fill up all cracks in Parian cement, and prepare surfaces of ceilings and walls; line with white lining paper and lap joints, clearcoale, and distemper, and pick out mouldings and enrichments. Or—

Fill up all cracks in Parian cement, and size, clearcoale, and distemper walls for decoration. The decorator is to make full-size cartoons from the architect's sketch (or to set out the ornament on paper, or on the walls for the architect's approval). The stencilled ornament and borders are to be made to accurately repeat, and with proper "ties" at intervals, and the tints to be selected and approved in position. The decorator to prepare all the necessary stencil plates, and to transfer the pattern accurately by means of a brush or sponge, so as to produce a clean, sharp pattern. The work to be approved by the architect. Pick out all mouldings and enrichments. Or—

31. *Painted Decoration*.—Prepare surfaces, fill up as before, and make full-size paper patterns for all the decoration from architect's sketches, with the tints shown and approved. After his

approval, the ornament is to be transferred to walls by means of red-chalk outlines or pounces pricked through the pattern, and the ornament is to be painted in two or more tints, the first laid on flat tint, and the shadows glazed with sepia or umber, and the mouldings and enrichments picked out in colours to the satisfaction of the architect. Or—

The colouring is to be in monochrome in tones of grey or sage-green, terracotta, or blue, the deeper shades of colour to be laid on first, then the next shade, and last the high lights.

32. *Relievo Decoration*.—The ceilings and walls of hall, staircase, and drawing-room to be stopped and prepared for relief decoration in *gesso*, which is to be done from the architect's design (or sketches), and under his directions. Transfer design to ceilings or panels. The whole of the work is to be hand-modelled, except the cornice and friezes, which are to be done with the aid of stencil-plates or millboard, the *gesso* being modelled on the stencil-plate. When removed, the plaster to be sharp and clean. The material to be of the best and finest quality gypsum or modelling plaster, mixed with thin glue-size to the consistency of cream, and to be applied quickly with a brush. For the higher parts of relief copper tacks are to be driven into the wall, and the lower relief to be not more than  $\frac{1}{16}$  in. to  $\frac{1}{4}$  in. Or—

Prepare walls, and lay on a coat of *gesso* composed of plaster of Paris or fine whiting mixed with glue-size, on parts to be in relief, the work to be done properly by hand, and to be modelled in low relief with hog's-hair and camel-hair brushes. The paste to be of the consistency of thick cream. (Instead of plaster and size, "Alabastine," a preparation made in several colours, can be used. It is very durable and hard.)

In our last article (p. 224) we gave a few sketches for lead-light panels for doors and windows, as 1, 2, 4, and 5, and the upper transom lights to a shop-front, 3. The borders are set with "burrs" or glass bottle-ends, which give a jewelled effect on the interior. Sketch 5 represents an ornamental leadwork light the leads being worked in curvilinear or folial forms corresponding to the cut panes. (See clauses 25, 26.)

In our present issue we show a few stencil patterns for borders, showing the "ties" suitable for margins of panels, friezes, bands, a, b, c. These patterns may be in monochrome shades in browns, reds, or greys. No. 2 represent a simple geometrical diaper for wall surfaces, and No. 3 a frieze.

#### PAPERHANGER.

In selecting a wall-paper, the lighting and aspect of the room are important; not less so is the use of the room. Rooms facing a cold aspect, north or east, should have a warm-toned paper; those with a sunny, or southern, aspect should have, on the contrary, cool colours—greys and blues—as the sunlight suffuses a warm glow over everything. In dark rooms the paper ought to be of light tone, and bright, so as to reflect all the available light. Of course, the pattern and tone of paper should also be dictated by the destination of room. Parlours and living-rooms should have cheerful, but subdued, patterns; drawing-rooms should have papers

of a bright and playful character, the colour and tone being adapted to the light and aspect. If pictures are to be hung, the colour and pattern should be subdued and quiet, or the pictures will be seen to great disadvantage or be "killed." A decided and obtrusive design is objectionable, as it forces itself upon the attention, so is a garish colour;—tertiaries and neutrals are the best tones.

Large patterns tend to make a room look small, especially where the whole pattern can be seen at once; upright vertical lines increase the apparent height of a room, and horizontal lines accentuate its length and width. Papers with fidgety, spotty patterns are always to be avoided, both in sitting-rooms and bedrooms, and for the latter quiet colours and patterns are desirable.

If there is a large and striking frieze, the "filling" or wall surface should be of a quieter tone and pattern.

In specifying, the architect should distinguish between hand block printed papers and machine printed; the former are superior for sharpness of pattern and colour, and the best designs are done in block printing. These are generally printed in distemper colours. Oil-printed papers have advantages, but the machine distemper papers are now largely used. Then there are flock papers of more or less relief, but these are not largely used now. For ceilings, papers printed in colours or monochromes, some in relief, are made in geometrical forms. Washable papers are numerous, and are well adapted for lavatories, bath-rooms, &c.

Several relief papers, or embossed fabrics, made from paper pulp, asbestos, canvas, linseed-oil and wood fibre, and other material, are in the market which are well known, such, for example, as the "Anaglypta" decoration (Anaglypta Co., Limited, Great Russell-street), the "Lincrusta," the "Coriacene" (Woollams and Co.), "Muraline," &c. Some of these are very effective relief decorations for walls and ceilings, made in a variety of patterns in every style of design, and the price moderate. These wall coverings vary in width, and can be painted, picked out in relief, and gilded. The "Anaglypta" fillings run from 21in. wide and upwards, and range widely in price. For machine printed and hand printed, raised flock, "Relievo" and embossed papers for ceilings and staircases, embossed copper panel decorations, firms such as Jeffrey and Co. may be specified.

NOTE.—A "piece" of paper is 12 yards long and 21in. wide, and contains seven square yards; and a piece of French paper is about 9 yards long by 18in. wide.

Describe preparation of walls, if rubbed down, sized, and stopped, and describe the least expensive first. State name of manufacturer, and quote pattern and price per piece.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary meeting of this Institute was held on Monday evening, the President, Professor George Aitchison, R.A., in the chair. The death was announced of Mr. James Murray, of Portman-street, W., who joined as an Associate in 1851, became a Fellow in 1867, and retired from practice in 1889.

## MUNICIPAL AND PUBLIC LIBRARIES.\*

Two interesting papers on this topic, both illustrated by lantern-slides, were read—the first by Mr. JAMES M. BRYDON, F.R.I.B.A., dealing with the planning and treatment with reference chiefly to buildings of a sumptuous type, such as those subsidised or erected by millionaires in the States; the second, by Mr. F. J. BURGOYNE, librarian of the Central Tate Free Library, Brixton, treated of matters of finance, arrangement, management, and fitting in reference to institutions of the more modest type built on the penny-rate basis in the United Kingdom.

Mr. BRYDON explained that he should confine his attention to the buildings themselves, leaving to Mr. Burgoyne all questions relating to management. He proposed to show, with as full illustrations as possible, something of what had been recently done in library building, so that one may learn to follow in the future. A suitable site is of primary importance. It should be central and

prominent, yet quiet; ample in area for future extension; have a good light all round, and be dry. As regards the building,

## THE FREE AND OPEN SYSTEM

of the ordinary popular library—i.e., reference and loan, combined with reading-rooms—rendered proper supervision essential, and as libraries are usually understaffed, the arrangements of the plan must be concentrated, so as to enable the officials to supervise at a glance all the rooms to which the public have access. An ideal plan is to place all the public rooms on one floor. Where this cannot be done, the rooms to which most frequent and rapid access is required should be placed on the ground floor, and those less frequented on an upper floor. The administrative portion of the library—such as the book stores, the librarian's office, and the workrooms for his staff—must be conveniently placed for the service of the departments, to which they are more particularly attached. The public rooms should be lofty, well-lighted, and thoroughly ventilated.

## THE PLANNING

of a public library is not, however, a very complicated problem. The requirements are comparatively few and simple, and lend themselves to a stately and architectural system of design from which some striking effects almost necessarily follow. It must be endowed with a fitting dignity both in plan and elevation. The reading-rooms being large, give ample scope for the designer's knowledge of proportion. They should possess that quiet dignity of effect which can only be obtained by good proportion and restraint in design. Fussy little bay windows and other nooks and corners are uncalled for and out of place. Respecting

## THE LENDING DEPARTMENT,

the author considered that an architectural opportunity had been missed in many recent English libraries. Instead of being simply a book store, with a space cut off for the public, the latter might be treated as a hall or lobby by itself, as in some of the American libraries, notably at Boston, which was designed by Mr. McKim. There the delivery room is 64ft. long by 33ft. wide, and 20ft. high, and is decorated in the most sumptuous manner. Adjoining it is the stack-room, to all parts of which application slips are sent through pneumatic tubes. The books come back to the alcove by means of an elevator, delivering into a little electric railway with low wire basket carriages, running at the rate of 500ft. per minute. The delivery-room at the Edinburgh Public Library, designed by Mr. G. Washington Browne, of that city, is modelled on the telling-room of a Scotch bank. The central space is devoted to the public, with counters round three sides, and alcoves behind them for the storage of 48,000 books. This arrangement gives scope for, and is treated with considerable architectural effect, a handsome hall, instead of, as in most cases, an unseen store-room, being the result. The public library of the future will be the centre of culture and enlightenment of the district in which it is placed, and will wield an influence which must ever become wider and stronger. The building, apart from its books, should be of such a character as to assist, rather than retard, this influence. The suburban villa type, with its useless turrets and bay windows, should be altogether discarded; in short, the building should be endowed with that distinction of style and nobility of design which will render it an enjoyment and inspiration to all who hope for the growth of a living interest in architecture as a fine art. Having briefly referred to

## THE ARRANGEMENT OF ROOMS

in libraries recently erected in the United Kingdom, including Brixton, Chelsea, Wolverhampton, West Ham, Dublin, and Liverpool, plans, sections, or views of all of which were shown, the author turned to the great American libraries, describing in more or less detail the buildings, plan, and notable features of the Congressional Library at Washington, of which a lucid historical sketch was given; the public library at Boston; the Columbia University Library, New York; and the public library about to be erected in New York. In the Washington Library, founded in 1800 and rebuilt in 1889-95, the American Government had commissioned American sculptors and painters—some 50 in all—to decorate broadly and thoroughly one of its great national monuments. The result was the most interesting record possible of the scope and

capabilities of American art. Not only sumptuousness of design, but richness of materials, had been pressed into the service—marble, bronze, mosaic, fresco, and choice woods all bear their part. The staircase, hall, and the rotunda or reading-room are each a blaze of rich marbles and decoration. In the rotunda the columns and pilasters of the piers carrying the dome are of red Numidian marble, resting on pedestals of dark purple Tennessee marble, their capitals being gilded. The screens between the piers are of yellow marble, and the portrait statues which surmount the balustrade are of bronze. The room is lighted by eight large lunettes filled with glass. The building is 468ft. long from north to south, 340ft. deep from east to west, by 72ft. high. The rotunda is 100ft. diameter, 125ft. high to the top of the dome, and 160ft. to the domed ceiling of the lantern. The architects were first Mr. Smithmeyer, then General Casey, Mr. Bernard Green, and Mr. Pelz. The building cost £1,272,000 sterling. The great architectural features of the Boston Library (built in 1886-96 at a cost of £475,000) are the staircase hall and the Bate's Hall, the former notable for its noble series of mural paintings by the late M. Puvis de Chavannes, illustrating Philosophy, Astronomy, History, Chemistry, Physics, Pastoral, Dramatic, and Epic Poetry. The cost of the eight panels was £10,000. Bate's Hall is the reference reading-room on the first floor; it is 218ft. by 42ft., and 50ft. high to the crown of its arched ceiling. It has accommodation for 264 readers at thirty-three tables. Sargent Hall, named after the eminent painter, is 84ft. long, 23ft. wide, and 26ft. high; the ceiling is vaulted, and the hall is lighted from the roof. The decorative painting will be entirely by Mr. Sargent; the scheme, representing the Triumph of Religion, illustrates certain stages of Jewish and Christian history. Some of the work was shown at the Royal Academy in 1894. The interior court, another charming feature, is surrounded on three sides by an open arcade of white marble, similar in design to that of the Cancellaria Palace in Rome. In its centre is a marble fountain, set about with grass plots. Along the walls under the arcade are low oak benches, so that on warm days the court may be used as an open-air reading-room. The building is a careful study of Modern Renaissance, thoughtfully and lovingly carried out, reflecting the greatest credit on its architect (Mr. Charles McKim, of the firm of McKim, Meade, and White) and the public spirit that called it into being. Many interesting facts and figures in connection with this library and the ten branch libraries at Boston were given by the author. The third library called attention to—that of the University of Columbia, New York—was built and presented to the university by Mr. Seth Low, president of the university, as a memorial to his father. Its construction and equipment have cost nearly £240,000. The architects were Messrs. McKim, Meade, and White, of New York. In plan it is like a Greek cross, with the great reading-room at the intersection of the arms, and covered by a dome. It has a magnificent approach of great terraces, and steps leading up to a noble entrance-porico of ten Greek Ionic columns. The entrance-hall is adorned with splendid marble columns. The building may be taken as an example of a typical university library worked out on modern lines to suit modern requirements—a utilitarian scheme artistically carried out. The public library about to be built in New York was the subject of a limited competition last year, and copies of the successful design, lent by the architects, Messrs. Carrère and Hastings, were exhibited in the meeting-room. In its main lines it somewhat resembles the Boston Library; but in the instructions was this distinction—that though the authorities did not object to external splendour, they were rather disposed to favour a simple interior. The winning design had resulted in a good plan and what promised to be a stately, dignified exterior. A marked feature is the raising of the building on a great terrace. The architects were not content with designing the building alone, it must have a dignified setting; so by means of broad flights of steps, terraces, fountains, and votive columns, the approaches were made to contribute to and enhance the effect of the architectural picture. This, the author thought, was a point to which more attention should be paid in public buildings in England. In conclusion, the author expressed the hope that these American works were not without their lesson for us in more senses

Clarkson), Oct. 14, 1892; Redruth, Passmore Edwards (James Hicks, Redruth), Aug. 3, 1894; Rochdale, plan, June 27, 1890; St. George, Bristol (Frank W. Wills), July 16, 1897; St. George's, Hanover-square (A. J. Bolton), Aug. 14, 1891, and Nov. 18, 1892; St. George's-in-the-East, Passmore Edwards (Maurice B. Adams), May 21 and Sept. 24, 1897, and Oct. 28, 1898; St. Ives, Cornwall, Passmore Edwards (John Symons and Son), May 1, 1896; St. Martin's-in-the-Fields (Robert Walker), March 6, 1891; Sale, Manchester (Robert J. McBeath, Manchester), Sept. 5, 1890; Shoreditch (Richard J. Lovell), May 12, 1893; do., Passmore Edwards (Henry T. Hare), Dec. 13, 1895, and Jan. 13, 1899; Southampton (A. E. J. Guy), Oct. 9, 1891; South Lambeth, Tate (Sidney R. J. Smith), April 19, 1889; Stoke Newington (Bridgman and Goss), Sept. 25, 1891; Streatham, Tate (Sidney R. J. Smith), April 24, 1891; Truro, Passmore Edwards (Silvanus Trevail), May 17, 1895; Walthamstow (J. Williams Dunford), Sept. 28, 1894; Washington, Congressional, Aug. 19, 1898; West Ham (Gibson and Russell), Oct. 4 and 11, 1895, and Oct. 7, 1898; Westminster (Francis J. Smith), July 7, 1893; West Norwood (Sidney R. J. Smith), June 27, 1890, and Jan. 30, 1891; Whitechapel (Potts, Son, and Hennings), Oct. 28, 1892; Widnes (Woodhouse and Willoughby), Sept. 11, 1896; Willesden (Edmeston and Gabriel), Jan. 12, 1894; Wolverhampton (Henry T. Hare), March 25, 1898; Yale, Conn. (Bruce Price), Jan. 13, 1899.

than one—not only as libraries, but as public buildings *per se*. Would that some of the public spirit and the love of art which animated the founders and designers of those works could be transferred to the hearts of the City Fathers of London and our great provincial towns!

LIBRARIES: THEIR MANAGEMENT, FITTINGS, AND ACCOMMODATION.

Mr. F. J. BURGEOYNE followed with a paper in which he made some telling observations on the very limited income derivable by municipal libraries from the rates, urging that the initial charges for building and sites should be paid out of the general rates, and the whole proceeds of the penny rate ought to be available for the current work of the library. The plan of the building should be considered, not only in relation to the public, but also to the probable size of the staff which the income will allow to be engaged. Dividing municipal libraries into three kinds, small, medium, and large, the author indicated the minimum accommodation that should be provided for staff, books, and public, illustrating his points by reference to plans of existing buildings, a large number of which were shown by the lantern. For a small library, the plan generally adopted is a rectangular room, lit chiefly from the top, with newspaper stands and tables in the centre; the walls, on one, two, or three sides shelved for books, 15ft. to 18ft. in height, and a counter or rail running round the room 6ft. or 8ft. distant from the books. Libraries of medium size require a quiet room where books of reference may be consulted. Such a room may be combined with one for reading the higher-class magazines and reviews. If the public rooms are all on one floor, the reference books will be shelved alongside those of the lending departments. If on two floors, the reference department is placed upstairs, and the lending and general newsroom on the ground floor.

#### IN THE LARGER LIBRARIES

the work done in the reference department is of the most valuable character, and it is advisable to have, in addition to the ordinary reference reading-room, a smaller room for the use of students of special subjects, or those who are engaged upon original research. The librarian should have a room for his own use—one that may be used, if necessary, for the meetings of his committee. In large libraries there should be a fireproof strong-room, on the same floor as the reference department, in which the rarer books and MSS. can be stored, and rooms for repairing and binding books. There should be mess-rooms for the staff, and suitable lavatory arrangements. The author recommended that before planning a building a clear idea of the method of work to be employed should be obtained from the librarian. The various methods of issue—with indicator, without indicator, and "open access"—require different accommodation and different arrangements, all duly described by the author. In shelving the books in the lending department, it is important to place them as near the issue-desk as possible, in order to facilitate quickness of issue. Reference-books, the author considered, were best shelved in a store-room adjacent to the reference reading-room. Room must be allowed for growth in this department. It was estimated that in the larger libraries stock would increase threefold in twenty-one years. To cope with such an accretion, the author favoured the adoption of the American "stack" system of packing the books, combined with rolling bookcases for works in least demand. This system was described by the author, and plans and sections were shown of the stack systems in the libraries at Grieswald, Halle, and Strasburg.

#### THE NEW SYSTEM OF SLIDING PRESSES

in use at the British Museum consists of stacks three tiers in height, and about 9ft. apart. In front of each bookcase a couple of steel girders with flanges are bolted to the iron floor above, at a distance of about 36in. from each other, and at right angles to the case. From these girders hangs a bookcase of the same width, to within a few inches of the floor. It can be filled with books, and is readily pulled away from its normal position close against the front of the fixed bookcase. It can be adopted piecemeal as the necessity arises for greater accommodation in any particular section of the library. A somewhat similar system is in use in the library of the India Office. The iron bookcases hang from girders, as at the British Museum, but are packed

close together, and if a book is wanted the case containing it is pulled out into the central gangway, which is the same width as the sliding case. This is the closest method of shelving yet devised, and very useful for books not much in use. All shelves should be of the same length—36in. is the most convenient length. No bookcase should be higher than 8ft.—7ft. is preferable. The lecturer concluded by showing lantern-slides of plans of libraries, most of which have been illustrated in our pages, and are referred to in a footnote. Valuable and practical criticisms were made on the merits and defects of the various schemes, especially on the desirability of providing in the smaller buildings for easy supervision of all departments from the librarian's desk.

Mr. F. PACY, hon. secretary to the Libraries Association, in opening the discussion which followed, congratulated his brother librarians on the fact that such a subject had been so clearly set forth before a representative body of architects who would be able to realise that the planning of public libraries was a subject which might well provide a field for the exercise of their highest abilities. Nothing could be more fatal to the success of a library than for it to be housed in a shabby and ill-arranged building in an out-of-the-way place. He was not in accordance with Mr. Burgoyne in his preference for the storage of books on the stack plan rather than in alcoves and along the walls. All proposals to decorate a library with paintings and frescoes, such as were adopted in the luxurious American buildings illustrated and described by Mr. Brydon, were quite out of place; there could be no better furniture for a library than its books. One practical hint that architects might consider was, that in their schemes for heating, the steam or hot-water pipes should not be placed behind the shelves, where they injured the books and filled the leaves with dust and dirt, but should be grouped in the centre of the rooms in the portion used by the public. By placing the librarian in the centre of the building, his easy supervision over all departments was certainly rendered practicable; but it had the disadvantage that he had to breathe the most impure air in the building. Tiles, marble, and other washable materials should be used where possible for walls and floors, and so the times during which the library was closed for periodical cleansing and decoration could be shortened. It was remarkable that in Great Britain, where we possessed an indigenous literature, the libraries were far less sumptuous and ample than in a new country like the United States.

Mr. J. H. QUINN, chief librarian, Chelsea, suggested that the architect of a public library should provide liberally for extras. In his own institution Mr. Brydon's designs were ruthlessly cut down by the building committee, who, within twelve months after its opening, regretted their own parsimony, but it was too late. He differed from Mr. Burgoyne in his liberal estimate of the rate at which a library could be weeded of works of fiction no longer in vogue. When the Chelsea Free Library was opened in 1891 they possessed 10,000 volumes, and it had now grown to 21,000. Before long they would have to build on space reserved at the rear, and he hoped Mr. Brydon would carry out the extension. The growth of libraries was inevitable. At Liverpool the William Brown Library had been already enlarged thrice, and now a fourth extension was in progress under Mr. E. W. Mountford.

Mr. H. H. STATHAM proposed a vote of thanks to Messrs. Brydon and Burgoyne for their interesting papers, remarking that it was cheering to hear from their colleagues that opportunities for architects and artist-decorators were presenting themselves in the States, while Mr. Burgoyne had shown that duties of a librarian did not necessarily extinguish in one the sense of humour. Complaint had been made of the risk of dust settling on books if air was admitted through open windows; but what was there to prevent dust getting in through air supplied by ventilating apparatus? As to the Liverpool libraries, the Pictorial circular reading-room was an ingenious and successful attempt to utilise a corner site, and unite two diverse buildings set at an obtuse angle to one another; but it had one serious drawback in use due to its shape and size—that every utiliser was reflected and magnified. The floors of libraries were generally laid with some noiseless material, which, from its absorbent nature, was not always easily kept clean. A better plan would be to produce a washable floor, and to cover it with strips of carpet or matting, which could be speedily taken up, changed, and replaced.

The vote was seconded by Mr. BERESFORD PATE, who observed that he recently had a surreptitious view of the most costly library in the United Kingdom—the Rylands Library at Manchester, now in course of erection from Mr. Basil Champneys' plans. The building was entirely exotic in style, possessing a gorgeous 15th-century vaulted hall; the windows filled with elaborate tracery, and the deep bays admitting a minimum of daylight. The outside atmosphere was to be excluded, but a current of air was to be washed, cleansed, and purified before being admitted to the building. There was necessarily a great difference in the treatment of such an institution, and one erected and supported out of a penny rate. He held that elaborate ornament and painted decoration were out of place in a free library, and that all space above the level of the books, say 7ft. 9in., should be left to whitewash and the imagination. Architects generally seemed at sea in the treatment of libraries, and the details were usually such as would be equally appropriate to baths and washhouses or vestry-halls. He believed that if our libraries were kept as plain as workhouses it would be a benefit to the architecture of the Metropolis in which we unhappily were obliged to live.

The vote of thanks was cordially passed, and Messrs. BYRDON and BURGEOYNE briefly replied.

#### COLOUR DECORATION.\*

IN our cities and manufacturing towns the architect, in attempting to add the charm of colour to his building, has to encounter the smoke demon, who, no sooner than the building is finished, sets to work to deface it as far as he is able. At present no remedy is possible. Perhaps in the future, when we shall see more use made of electricity, or some means are found to compel manufacturers and householders effectually to consume their own smoke, we may see our buildings decorated with colour of a more cheerful tone than they now possess.

#### THE RESTLESSNESS OF GLAZED SURFACES.

The trials which have been made of glazed earthenware or majolica for both outside and inside architectural treatment are hardly satisfactory. It is an excellent material where cleanliness is a sanitary necessity; but the glazed surface is fatal to that repose that colour when applied to a building seems to demand. It gives a restless appearance which is disturbing to the harmony of colour; and even this material the smoke fiend does not respect. But then you can wash it, say its advocates. So you doubtless can; but do you find in practice it is washed? The light falling on the mouldings and ornaments is a disturbing element, and distorts them. It gives a better appearance and is more decorative if the material presents a smooth, non-reflecting surface, and has only a dull glaze. Detached objects executed in a glazed earthenware are properly so treated; when applied in larger surfaces it becomes distracting. These remarks apply, but in a lesser degree, to polished marble, which, unless introduced with great discrimination, is hardly satisfactory when covering large surfaces. Mosaic should be always employed on a concave or convex surface, and is hardly ever pleasing on a flat surface; hence its unsuitability in reredoses, as generally applied. I ask how long the custodians of our cathedrals and churches and the worshippers in them, will be content with the sculpture and painting that is generally thought good enough? There are not wanting instances where one sees work which it is a pleasure to find; but such instances are rare. Buildings erected by our best architects contain too often sculpture and painting executed by incompetent and nameless artists. The late John D. Sedding saw this need for calling on accomplished artists to help him in his work, and all true architects would wish it, instead of having to be content with the poor, lifeless, mechanical productions of advertising firms one generally sees.

#### SOME DECORATIONS BY COTTIER.

Mention must, however, in fairness be made of the great progress made in stained glass; much of it is admirable. In a house in the North, where it has been my privilege to stay many times, is a mode of decoration which is original, and certainly most delightful. I am indebted to the owner for a description of the work. He was

\* Abstract of a paper by COLE ALFRED ADAMS, F.R.I.B.A., read before the London Architectural Association, Friday, Feb. 17, 1899 (see p. 264 post).

present and saw how the work was done, and the artist who executed it was a Scotchman—by name Cottier—a man of great genius, better known in the North and America than here in London. The walls and ceilings were prepared in the usual way. They were then covered with a thick coat of oil and whitelead, made the consistency of pudding, and laid upon the walls and ceilings with a trowel. The next process depended upon what the nature of the design was to be. Supposing it was the ceiling to be treated, as a vine trailing over the whole surface; the artist with his thumb boldly draws the leading lines of the design, and then with the end of an ordinary paint-brush draws the stalk, leaves, and fruit. Those parts which he wishes to emphasise he modelled in the material—such as the grapes, which are raised in relief; in fact, with the coating, which he has been careful not to lay on to a uniform thickness, he is able to produce effects, whilst moist, as his fancy dictates. If he wants a more or less geometrical pattern on the walls, he takes a comb and by eye draws in patterns such as you may see done on the outside plaster of old cottages in Suffolk and elsewhere, and also similar to some Japanese patterns with which you are all familiar. Again, on the surface thus prepared, he puts a powdering here and there of small patterns. This coat is allowed to dry and harden. It is then painted the general colour it is to be, and the artist has various mixings at hand of the same colour, and blends them as he goes. Those parts of the design to be gilded are so done, and the various colours applied and allowed to dry. Finally, the work is dull-varnished, and has bronze powder mixed with the varnish, which gives a kind of sheen to the whole. The bright parts in gold are toned down, and the colours blended one with the other. This process is unlike anything with which I am acquainted, and it has great possibilities. The burred edges of the patterns, flowers or fruit, raised in the process reflect light. The colours running one into the other satisfy the eye by their variety, and the dull old-gold effects, mingling again with the bronzes, give a richness and *tout ensemble* which is charming. This work, however, must be done by artists. Executed by the ordinary decorator it would be intolerable. One striking effect in this house was suggested by the patron: he saw a ceiling after it had been floated with the oil and white-lead with the trowel marks left. With a happy inspiration, he told the man to leave it so, and paint it with a deep copper bronze. The result is a most happy one—it has the same charm that beaten copper produces. The rooms in the house described are fine and lofty, the floors of parquet, and the house full of the most delightful old wood-work and furniture gathered from many cities at home and abroad; the walls are hung with pictures, and an air of distinction and good taste is prevalent everywhere. Why should not young architects become decorators? There may be some among you with an eye and love for colour and ornament who might do much worse than take up this branch of architecture as their calling. With the advantages you enjoy of learning your profession, it would be a great gain to you, and you would bring to bear a knowledge of architecture and building construction which would be of infinite use. Growing up around us are town-halls, picture galleries, free libraries, swimming-baths, &c. Do not these offer scope for the artist? For a moderate sum they might be made more attractive and interesting. Now, what happens? The powers that be call in the local painter and decorator; he sets to work and paints it. Knowing very little of the principles of decoration, and absolutely nothing about architecture, he cannot apply his decoration architecturally, and, as a result, he not only wrongs the building and the architect who designed it, but commits the further crime of offending against good taste. Now, for comparatively a few guineas paid to an architect who made such work his speciality, or to a skilled decorative artist, the same local painter and decorator might be led to turn out a work which would at once appeal to educated taste, and give the public decoration of which they might be proud. If authorities having the care of such buildings knew where they could obtain competent advice and skill in carrying out this class of work, they would avail themselves of it. There is abroad everywhere a quickening of interest in public life, and, as time goes on, we may look for a further extension of this good work—a tendency to break down class prejudices;

much may be done to render the lives and homes of the poor happier and better by this process of levelling up. To this end the decorative artist may employ his talent, and do good by creating beautiful work that must have a refining influence. Is it not worth working for to become one of those who shall add to the fame of the town who employs him, by his skill in colour decoration, instead of leaving such work to be ignorantly and vulgarly carried out?

#### EXPERIENCE IN PRACTICAL DECORATION

may be gained in a way that is probably within the reach of most of you. In the parish in which you reside there will be a school or a parish room, and the parson would doubtless be glad of any one who could be found to volunteer to decorate it. This would give you the opportunity of doing experimental work which would be excellent training, and, at the same time, you will be doing practical good to others. But how to set about it! The parson may not unreasonably object to having his building made use of for experiments. You must first qualify yourselves by learning the handicraft to convince him you know something about the art. One of the best ways to study decoration is to sit down before the object you are engaged upon and try and grasp the notion or leading idea of the artist; how he has treated it and how worked it out; what leading colour or colours he has chosen; in short, its leading characteristics. This sitting down before the object you wish to study, and, so to speak, inhaling it through the pores will not be lost time. It will, moreover, have the great advantage of training you to the habit of recollecting a scheme of design and colour, so that when you come to transmit your thoughts to paper, you will have the faculty of seeing your design in your mind's eye. To resume. Having taken in the scheme or design—the next best thing is—supposing it to be a ceiling, for instance—to make a plan and sections of it, then select that portion which will illustrate how the design or pattern will repeat. These drawings you should sketch as neatly and with as little detail as will express the thing you are at work upon, then put on a few leading dimensions; note the distance from the eye where the decoration is most effective, the style, probable or approximate date, place, and, in fact, each and everything that occurs to you as worth noting. I have found by experience the utmost use of thus jotting down particulars of what I am sketching, and (may be years after) it recalls the subject and gives you data which may have passed from the memory. Having made these drawings, you may now proceed to detail the work to a larger scale and draw with the greatest care the ornament. A number or letter referring to where the part is should be noted on the plan or section, so that the details may agree with the drawings. When you have got your details sufficiently forward in pencil you may then proceed to colour them, and this will test your eye for colour. If you have not got your colours with you, or are pressed for time, a simple plan is to put on the drawing a schedule of colours and number them thus: red 1, blue 2, yellow 3, and so on; or you may elect to adopt the heraldic method. Either of these ways will be of use in keeping you in mind of the scheme of colour, and then you can at your leisure colour in your drawing; but the study will be of most use which is painted on the spot. And the habit of noting will be of use in describing how particular effects are produced and where the colouring has been influenced by the hand of time. Some decoration which we find now so charming owes that charm to reasons never dreamt of by the artists who did the work. In fact, the work of the past owes a great deal to the hand and palette of good old Father Time. Of course, in sketching at a museum, for instance, the object is generally detached, and can be embraced in one drawing; but here, again, I would urge upon you the need of cultivating your power of criticism and observation by noting down any memoranda which the subject may call forth. Let nothing appear too trivial. Where the detail would work out very small and not large enough to explain the design, that part should be drawn to a larger scale. As you proceed you will insensibly learn what best shows and illustrates the subject which you are engaged upon.

#### IN STUDYING FROM NATURE

the same method should be adopted. And as correctness, beauty, and accuracy of line cannot

be learnt better than by study from the living model, the same principle exists in studies made from still life, and no better advice can be given to those studying decoration than to go direct to that source. Every subtlety of line, curve, and contour, every gradation of colour and tint, of light and shade, will be found by those who seek it, in endless variety, and great is the happiness of the search. Store your sketch-book with such studies. Take, for instance, a spray of any flowering plant and sketch it in outline with the stalk, leaves, and flowers, with just enough detail to express it. Note the varieties of form and curve, and how the effect is produced. Then sketch the same spray from another point of view, and if you wish to study it further, from yet another. Then detach one of the flowers and carefully draw it in all its parts, if possible to a full size, the plan, elevation, and section. What is the use of all this? is asked. Every use: for the knowledge of parts thus grasped will one day stand you in good stead, and it teaches you the value of patient research, and trains you in the habit of thinking no part of your work too small or insignificant, besides giving you glimpses of the miraculous, and discovering new beauties which you never so much as dreamt of. You must, therefore, train yourself in the habit of close observation, which will in time become a habit. The simplest flowers are the most suitable to study from, and the most useful, the simpler the better. For models of expression in sketching you should study the Japanese. They succeed in that most difficult art of knowing how much to put into the picture to express its meaning. Time spent in studying these drawings will not be lost. Excellent Japanese books can be procured at Mr. B. T. Batsford's, bookseller, Holborn, and very inexpensively.

(To be continued.)

#### "BUILDING NEWS" DESIGNING CLUB.

A VILLAGE TAVERN.

THE limit of our choice has afforded no opportunity for the selection of designs—at least, for the two first places—from the rank and file of our contributors to the Club competitions. "Thistle" and "McGilligan" change places; but the superior character of their work, as compared with the other drawings sent in, has prevented the introduction of fresh names at the head of the list, which, to speak candidly, we would rather have seen diversified. Justice, however, must be done, even at the risk of what, to others, may seem a degree of partiality on our part. The goal to be aimed at in our club's work is the greatest good for the greatest number, and we are anxious to inspire among all the members a serious determination to persevere, even although it may so happen that some who hoped for more immediate success do not come to the top. The general improvement of the many is of far more consequence than the striking achievements of the few. Those who take their places among the best, notwithstanding these remarks, most assuredly have our sincere congratulations; but as nothing succeeds like success, they will need but little additional inducement to make the most of their opportunities. It is inevitable in the ordinary course of things that some who have tried, as they think, in vain, will fall away. No greater mistake could be made in their own interest, and certainly in no other. Practice and experience can be obtained in no other way than by repeated endeavour, while by working out a problem for themselves they will be better able to take advantage of the suggestions afforded by the chosen plans and the critical remarks which accompany the illustrations.

In accordance with our custom, we print, for reference, the conditions issued for this particular subject:—"D.—A Village Tavern situated by the road-side in the main street, with a frontage of 48ft., the ground line falling from left to right 1 in 12. The elevation is set back 15ft. from the rear line of pavement; but a porch or bays may project from the building not more than 6ft. The adjoining houses are plain 18th-century brick ones, 26ft. high to top of parapet. A carriage entrance, 10ft. wide, must be contrived leading to the stable-yard in the rear. The new building to comprise ground floor, first floor, and second floor. The top rooms may be partly in roof. The accommodation to include a good, sufficiently ample public bar, a smoke-room, a good, spacious stairway, 4ft. wide, leading

to club or meeting room about 32ft. long by 20ft. wide, or of that area on the first floor. There must be a billiard-room for two full-size tables on the ground floor, and a 'tap-room' leading out of the stable-yard. The stables and coach-house need not necessarily be drawn in. The residence connected with the tavern to comprise a sitting-room to the rear of the bar, a good ample kitchen, scullery and offices, five bedrooms, bath-room, and w.c. Sanitary accommodation for customers must be arranged in the yard premises; but it is essential to keep the house and its buildings distinct from the public part of the establishment. A retiring-room in conjunction with the big room on the first floor is necessary, also a rolling-way and hatch to the cellars below. The elevation is to extend the whole width of the site in front, and must include the 10ft. way already mentioned. The forecourt to be inclosed with posts and chains. A sign of the 'Red Lion' is to form part of the design. Style, 'Later Renaissance,' in red brick mainly, with stone sparingly used. An old-fashioned-looking tavern is required, not a modern gin-palace. Tiles for the roof. Parts may be plastered. Scale, 8ft. to the inch for elevation, and two sections, plans 16ft. to the inch if desired. There must be a sketch view."

"Thistle," "McGilligan," and "Nothe" are accorded the first, second, and third places respectively. The problem is not a cut-and-dried one by any manner of means, and the restricted character of the site, considering the requirements, necessitated no little thought on the part of the contributors. The 10ft. carriage-way and the billiard-room located on the ground floor increased the difficulty. "Thistle's" scheme may not be an ideal solution of the problem, but it is by far the best; while the suitability of the elevation may be at once acknowledged. The staircase crowding up the main entrance is a weak feature in the planning, while the entrance door being placed towards the lower level of the frontage necessitates the steps up to the ground floor level just inside the porch at the end of the passage, which is very awkward. Architecturally, too, the bay appears to suggest a room window rather than a staircase. Strictly speaking, this is an objection, though the chief criticism must be directed against the cramped space inside. On the other hand, the short stages of the stairway itself, leading from an assembly hall, are contrived to prevent crushing, and being so near the exit the audience would be soon out in the street. The bar is none too light. The tap-room has an external door under the covered way; but the apartment is not very convenient, almost all doors, window, and fireplace. The outside approach to the billiard-rooms is good; but the w.c. should have had a ventilated lobby and space ought to have been provided for a lavatory basin. The coal-place is awkwardly located. The kitchen is ingeniously contrived on the first floor, and is in a favourable position for serving dinners in the meeting-room; the back stairs would not only cut into the sitting-room, but would hamper the floor space of the scullery, if head room is well allowed for, as it must be. The divisional walls, too, upstairs are shown without much regard to the arrangements below, and lath and plaster partitions are not the result of really good planning. Would not a girder over the carriage-way opening have looked more satisfactory than the flat arch, which would have to be held up? The front door, for effect sake, is shown to hang the wrong way in the view. "Thistle" has not done the design for the entrance stone-work justice in his sketch, while in the section through the sitting-room he avoids the real crux in the matter of the rear staircase above mentioned.

"McGilligan" sends a pleasing front, though his detail is thin, particularly the pilasters to the entrance, which are drawn flush with the walling. The plan is ingenious, but not good, with the dark, long corridor in the centre of the building and the kitchen door at the end of the vista. No w.c. is provided for the billiard-room or the retiring-room upstairs. The service from the kitchen to the club-room is not good, while the lift, if used for anything more than drinks, is too small and too much in the way in the main entrance passage.

"Nothe," who ranks third, has distinct merit; but in the outline view he has hardly given sufficient emphasis to the roughcast treatment of the gables. In reality, they would appear more like the effect indicated in the elevation. The plan has similar defects to those pointed out in others. The central corridor would

be none too light, and the kitchen has little reference to the club-room upstairs. This apartment has no lavatory or convenience *en suite*. The public bar is not very nicely contrived, and the standing space in the hall at the foot of the staircase is awkward. The tap-room is not well located. The fourth position is taken by "Vignoria," who knows the value of simplicity in design, though his drawing is spiritless and poor. He isolates his house arrangements rather well from the public part of the building, and gives a good lavatory and w.c. to the billiard-room. The lift to serve the club-room would be most inconvenient, and the kitchen is a long way off. The tap-room down in the stable-yard would require a barman to be in attendance, as it is entirely isolated from the house. The front bar is not a good one, with the curved counter.

"Quadrant" draws in a splashy way. The sharply-pitched gables ill accord with the broadly-handled bays below, and these latter are not happily contrived. The tunnel between the two service counters, and running under the staircase is ingenious; but the whole arrangement is too cramped. It is a great mistake to make the only approach to the billiard-room through the smoke-room. The meeting-room is not a good shape, and it is entirely cut off from the kitchen, with no chance of serving a dinner. "Swan's" plan bears a very neighbourly likeness to the last named, and in some respects it is better, though in a general way it looks like "Quadrant's" plan turned over. The same contrivance under the stairs has been adopted, and the billiard-room is reached through the smoke-room. The tap-room comes close up to the bar parlour, with a door out of the archway for carts. As in the other, the kitchen has not been considered in relation to the club-room. Externally, this design seems wanting in point, and the archway being out of the centre of the gable as well as the bay oriel above, considerably mars the symmetrical effect imposed by the skyline. The interior woodwork is suggestive of taste. "Tokio" puts his windows very low down in a way not in accord with modern ideas of light and ventilation. He thereby gains a degree of quaintness in his exterior, and we accord him praise for his endeavour to insure a broad treatment. His plan has considerable merit, which we have not overlooked. The billiard-room is well placed, with a fireplace at each end, but the w.c. and lavatory ventilated only from the top is not a model arrangement. The kitchen, again, as before, is far away from the big room upstairs. The care devoted to the house-yard, scullery, and washhouse, &c., is commendable. "Tokio" ought to have avoided long, narrow passages. The tower was not wanted, and rather spoils his composition. "Scruton" overdoes his design, drawing in a heavy manner, and overweighting the elevation with pilasters and pediments. The whole thing is too ambitious, though marked by a degree of cleverness. The meeting-room is not a nice shape, and the landing is very wasteful; but the staircase with a lobby of its own has a distinct advantage in some ways. The coffee-room upstairs was not asked for, and the public-house is schemed too much on the model of a suburban house. "Pup" is improving, and if his drawings were more refined and not so crude he would stand a better chance. The whole performance is too rough and intentionally odd. The plan might have been made a success, with a little more thought. "The Old Firm" has not taken a village tavern of the old type as a model, but prefers the regulation "pub," with a roomy but uncomfortable bar, and a club-room contrived with little regard to hospitality beyond drinking. The design is, however, very well worked out from the author's standpoint, though we do not like his elevation. "Cantab," who comes next, has more sense of fitness. His perspective spoils the proportions of his facade. The plan is too cut up with passages. "La Poupée" mixes the scullery and billiard-room up together too much, and the elevation, which is country-like, is spoiled by odd little windows close up under the eaves, making the meeting-room exceedingly ungainly inside. The projecting window to the retiring-room must be fit off the floor, judging from the perspective. "Grip" has merit, and shows ability; but his Red Lion Tavern might be taken for a police station. The plan is rather a good one, and is well worked out, though wasteful in staircases. The meeting-room has a recessed stage, which is all very well, but the place is not large enough for such a contrivance. "Espoir" marks his front

with three curved-shaped oriels, though there is a want of governing idea in the treatment, which is lop-sided and meaningless. The plan is very much of the same kind, with little sense of roominess. The symmetry of the three oriels in the club-room itself would be right enough inside. A third gable would have brought the external elevation more into shape. "Arc" might just as well have chosen a sweetly-shaped gable for the central feature of his frontispiece, instead of this waggon hood of a pediment, while his entrance comes nowhere in the composition—that is to say, the author has not realised the importance of the entrance as compared with the remainder of the elevation, particularly where a balance of parts above the ground story has been allowed to dominate. "Casual" would greatly have improved his tavern front if two gables had been introduced instead of one, and we are at a loss to understand why this was not done. The bar is too far inside the house, and the billiard-room brought to the front is not improved thereby. The club-room is well lighted, but the retiring-room cannot be got at except from the big room, and it has no w.c. The kitchen is right away at the back end of the building. The elevation is one of the best submitted. "Balbus" sends a regulation public house, though it is devoid of vulgarity, and has refined and simple detail. The broken eaves cornice cut away six times for the dormers is ugly enough, and stackpipes (not shown), necessary to carry off the roof water would be very much in the way below. The plan is poor. "Claude" approaches the conclusion of the series of the first-class designs. Three gables, three oriels, and three big arches make up the prescription for the treatment of his elevation. The plan follows, the cartway being in the midst. This cuts up the house too much into two, with no economy of administration. Externally, "Claude" secures a point, but it is at the sacrifice of homeliness and village-like hospitality.

"Astragal" has a very pretty elevation, and with it ends the best of the proposals made for our tavern. In execution this scheme would look well with its Tudor-like projecting porch, recalling the "Luttrell Arms" at Dunster. The plan, unfortunately, ill accords with the front, so inconveniently are the parts jumbled together. The bar is cramped. The billiard-room is a bad shape, and is too much shut off from the forepart of the premises. To reach it the visitor must either pass the kitchen or go outside. "Gargoyle" plans badly and draws poorly. The scheme of his front with the four oriels and two gables over the middle ones might have been made a pleasing arrangement if the detail had only been better. The front chimney comes somehow over a void, and the top floor is not quite clear. "F" draws neatly, and puts in sweep's brushes for trees. His plan has evidently had no little thought expended upon it. The loss in passages is an objection which "F" should avoid another time. "Blue Funk" need not feel so. He divides his bar in the "bottle" and "jug" fashion by screens, and cleverly has a hatch to serve the smoke-room, and the same for the tap-room. This indicates care. The club-room is well adapted for that purpose, but for meetings it would not do. "Blue Funk" has given a suburban house rather than one fitted for the wants of a village. His elevation would be considered pretty. We do not go so far as that; but the removal of the turret would have improved it. "Butts" is plain, and has a careful plan. The sections are worked out in a painstaking manner. "Vulcan" should have left out the trees. The flat pitch of his main roof does not harmonise with the sharp pitch of the front gables. The mitre would look so ugly, though, as a matter of fact, the main ridge would be lost from the street. In perspective "Vulcan" fudges the roofing to make it show. "Hoopoe" fudges nothing, and tries his level best, showing his work most conscientiously, making a feature of the wrought-iron sign. His plan is too cut up, and the style chosen is too pretentious. The other designs come as follows:—"Indian Ink," "Philomel," "Notts," "Quercus," "Sphinx," "Jonnie," "Angler," "Sparrow," and "First Attempt," which comes last.

A window in the modern chancel of the fine Perpendicular parish church of Cromer is about to be filled with stained glass, representing the Parable of the Sower, as a memorial of the late Rev. F. Fitch, for 53 years curate and vicar.

# CHAIR-TABLE MADE FOR H.R.H. PRINCESS HENRY OF BATTENBERG.

BY the courtesy of Mr Percy G. Stone, from whose designs it was made, we are enabled to give two illustrations of a Chair-Table just executed for H.R.H. Princess Henry of Battenberg. As a rule, "convertible" furniture is not distinguished for beauty of design or fitness of purpose; but this example is as simple and successful in all respects as any we ever remember to have seen.

## THE MANAGEMENT AND VALUATION OF BRICKFIELDS.

UNDER the above title a paper was read at the ordinary general meeting of the Surveyors' Institution, on Monday last, by Mr. R. L. Crouch, who dealt with the subject especially from the point of view of the surveyor, who had to do with arrangements between owners of brick-earth land and tenants who desired to work it at a profit. The paper dealt first with the geology of brick earth and the method of testing its fitness for special purposes, next with the working of a Metropolitan or rather suburban brickfield, next with the covenants in a brickfield lease, and lastly with the assessment for rating purposes of a brickfield and its valuation as between landlord and tenant, or incomer and landlord, at the termination of a lease. The author gave an exhaustive classification and analysis of brick earths, under the heads of clays, loams, and marls, all being alluvial deposits of varying thickness and constitution, the clays being hydrous silicates of alumina, of which the purest form was kaolin, or china clay, which, it was necessary to remember, would shrink and crack in drying and fixing in proportion as the alumina exceeded the silica. This could be remedied by adding sand. The distinctive characteristic of clay was its plasticity, which depended, so the author held, on its interstitial, but not chemically combined, water; for though a powdered brick would absorb a large proportion of water, it did not become plastic. Kaolin was derived from the decomposition of granite rocks, as a result of the action of the free carbonic acid in the air on silicate of potash and soda. The author proceeded to give interesting analyses of china clay, china stone, and pipe-clay, which are perhaps too full and technical to quote at length, our main object being to view his paper as dealing with brickmaking from the building aspect. The testing of soils was learnedly dealt with, and boring instruments advocated as preferable to test pits. The well-known system of boring was fully described, with a note of the usual precautions which are observed in the preservation of the several and distinct samples from each bore. It might be argued, as it had been by at least one well known professor, that an empirical test is the only practical test of what the results from a given boring would be; but the author contended that an analytical test was a great help in determining beforehand the value of a bed of clay. It must not be forgotten, however, that the value of the clay largely depended on the cost of getting it, of working it, of carting it, and of finding a market for the finished bricks. The author then went into a careful description of the various methods used for analysing the constituents of a clay, and from such an analysis determining its value as a brick-making earth, and followed with a description of the various processes of manufacturing bricks and the action of different constituents on the colour, hardness, or texture of the resultant bricks. The description of the process of burning stock bricks in clamps, as practised in the suburbs of London, followed, with a résumé of the advantages of the system, as preventing undue contraction of the moulded bricks, and the disadvantages in the way of unpleasant fumes from the ash-heaps and from the burning. The process of moulding, pugging, drying, and burning were dealt with, and the author next came to the important question of brick leases and brick royalties. The usual method was, he said, for the brick-maker to produce his moulders' books, showing the number made at so much per thousand, as checked by his wages book, to enable the owner or his agent to calculate the royalty (after taking care to occasionally look round the yard to see that a fair stock was kept up). Then came an allowance for waste—i.e., spoiled bricks, weather, firing, &c., which the author estimated at 5 per cent., although we have known instances

in which it is put, perhaps more fairly, at 10 per cent. The lessee should covenant to remove all top soil or vegetable mould and store and replace it at the end of the tenancy. Any clay brought

on to the ground must be considered as the landowner's. The ultimate prospective use of the field must, of course, be considered. If the land would then be suitable for building or for agricultural purposes it would be necessary to covenant for its being levelled to a fair surface, and

value to the hypothetical tenant, although the working and management of one field might make it of very much more annual value than that of another carelessly or ignorantly looked after. The depth of soil must be considered. If too deep, it was expensive to work. If too shallow, it hardly paid for the rent and the removal of the surface, and allowance must be made for proximity to town, accommodation for workmen, facilities for obtaining fuel and water, and, above all, cost of carriage to the best market.

Mr. J. Jopling said he had given the subject much attention for a number of years. He would advise anyone who wished to start brickmaking on unknown land to make practical experiments, and, if these were not successful, to consult an expert analyst. As to rating, no two fields, even in the same parish, could be assessed alike. He agreed that less than 3ft. of brick earth would not pay to work, but, on the other hand, the line must be drawn, he thought, at a maximum of 30ft. He had seen sanguine prospectuses, issued by vendors, stating that there were so many acres of brick earth 200ft. deep, which would cube out at so many million bricks. What was the good of clay at 200ft. deep? If one could not get clay within 30ft. of the surface, within reasonable distance of a market for the bricks, or of carriage by rail or water, if there were no available labour or fuel, and no prospect of disposal of the output, it would be better, he thought, to leave the land alone, and feed sheep on the grass growing on its surface. Many people thought they had only to dig clay, mould it into bricks, and burn it, and "there you are." There, indeed, they were! He believed a boring to be the best test, for such things had been known as carefully-prepared "test-pits." The valuation of the machinery of a field depended entirely upon whether it had been bought with a special intelligent knowledge of its adaptability to the circumstances of the particular field. A machine worth £500 in one field might be only worth £25 as old iron in another.

Mr. F. B. Buckland said that, although brick-making was one of the oldest arts, as instanced by the references to the Tower of Babel and the labours of the early Israelites, and by the works of the Romans, it must not be forgotten that times had changed, and that now steam and even electricity played a large part in the manufacture of bricks. He lately saw a brickworks where the whole chain apparatus had been superseded by

CHAIR-TABLE FOR PRINCESS HENRY OF BATTENBERG.

plans and sections should be attached to the lease. The question of the use of bricks made on the field for the purpose of sheds, &c., for the use of the lessee, and the subsequent property in such materials had lately been raised by a query in the "Professional Notes" of the Institution; but this, the author thought, depended entirely on whether the erections could be considered as "trade fixtures" or not. The rating of brickfields must depend, in every case, upon their

electric wires. He would suggest that there should be in all brick leases a covenant that no use should be made of the land except for brick-making or agricultural purposes, thus doing away with the present undoubted nuisance of brick-yards being turned into dustbin-refuse deposits and sifting-grounds.

Mr. G. Wragge could not help agreeing that the dustbin refuse and the burning of ashes in the making of stock-bricks was a nuisance; but

he asked the landowners, who derived a royalty from the brick-earth, and who at the same time complained that clump-burning was a nuisance to the rest of their tenants, to suggest any method by which stock-bricks could be burned without ashes. He was sure any reasonable scheme would be eagerly taken up by the brickmakers.

Mr. J. W. Kemsley and Mr. J. J. Robson also spoke on Mr. Crouch's paper, agreeing on the whole with his conclusions, and the author having very briefly replied, thanking the members for their reception of his remarks, the meeting then adjourned.

#### SEWER VENTILATION.

LAST week we illustrated Messrs. Robert Boyle and Son's system of ventilation as applied to the sewers of a town. The diagram on the next page shows the application of the system to suburban sewers, to meet the difficulty which has hitherto been experienced in getting rid of the disagreeable smells arising from street ventilators. As the "air-pump" upcast ventilator, and also the downcast ventilator are fixtures, and have no movable parts, they cannot get out of order. There are no parts to corrode by the action of the gases arising from the sewers, as in the case of some ventilators, which cease to revolve with sufficient rapidity, causing the air to pass downwards instead of upwards, and driving the odours from the sewers up through the street openings.

#### OBITUARY.

MR. HAYWARD RICHARDSON BRAKSPEAR, A.R.I.B.A., who for over eighteen years was a member of the architectural staff at Spring-gardens, employed by the Metropolitan Board of Works, and their successors the London County Council, died on Tuesday, the 14th inst., at his residence, Ulverscroft, Napier-road, Wembley. He joined the Royal Institute of British Architects as an Associate (by examination) in 1888.

#### CHIPS.

Wellington parish church is being fitted with the latest improved "small tube" hot-water apparatus, by John King, Limited, engineers, Liverpool, employing their well-known special economic coil-heater, with waterway fire-bars.

A new line of electric tramways at Bradford to Eccleshill Mechanics' Institute, from the top of Bolton-road, belonging to the Bradford Corporation, was formally inspected on Tuesday by Sir F. Marindin, who expressed his satisfaction with the work.

A faculty was granted by Dr. Tristram, Q.C., Chancellor of the Diocese of London, on Friday, to the vicar of St. Philip's, Stepney, authorising him to convey an unconsecrated portion of the burial ground at the rear of his church, comprising 7,500 sq. ft., to the governors of the London Hospital for the extension of that building from plans prepared by Mr. Rowland Plumbe, F.R.I.B.A.

At the Auction Mart, Tokenhouse Yard, last week, several parcels of leasehold ground-rents changed hands at over 23 years' purchase, and others were only withdrawn because 24 years' purchase proved unacceptable. A City freehold of some magnitude and a building site at West Norwood found competition and sale. Metropolitan and suburban property accounted for a large proportion of the total amount realised, the business done, including transactions not officially reported, amounting to £98,718.

The annual report of the Surveyors' and Auctioneers' Clerks' Provident Association states that the advance in receipts amounted to £53, and the invested funds have increased by £343. The committee have made grants from the Benevolent Fund of £10, and the sick claims have amounted to £30. The number of members is 136. The annual meeting will be held on Wednesday next, the 1st March.

On the retirement of Mr. W. H. Preece, C.B., the Postmaster-General has appointed Mr. J. Hookey, previously assistant engineer-in-chief, to be engineer-in-chief of the Post Office, and he has also appointed Mr. J. Cavey to be assistant engineer-in-chief and electrician.

The papers and MSS. from the Deed-room, Wimpole Hall, the property of the Earl of Hardwicke, which have been recently catalogued for sale by Messrs. Sotheby, Wilkinson, and Hodge, have been privately sold to the British Museum. The collection consists of a large number of letters of historical, political, and literary interest, to a great extent accumulated by Lord Chancellor Hardwicke.

#### COMPETITIONS.

THE REBUILDING OF THE OLD BAILEY.—The city surveyor (Mr. Andrew Murray) and Professor George Aitchison, P.R.I.B.A., are engaged in preparing the instructions to the six competing architects who will be asked to submit the plans for a new sessions house in the Old Bailey. The new building will probably cost over £150,000 to erect.

BRADFORD.—The Fire Brigade Station competition at Bradford has been settled, and Messrs. Mawson and Hudson, of Bradford, are the chosen architects. There were 44 designs submitted, and we understand the drawings were on public exhibition for two days up to Saturday night last; but several complaints have reached us from competitors who say they knew nothing of the exhibition, which they describe as having been closed before an opportunity was afforded them of inspecting the premiated designs, the announcement of the exhibition only appearing in an evening local paper on Friday last. It is a matter of regret, should this prove to be true, because, apart from the advantage of publicity, it is very desirable that competitors should see how those who manage to be successful have worked out the problem. Moreover, it is only reasonable to exhibit the plans so that it may be seen how the conditions have been complied with, and the rules of the contest adhered to—conditions which are, of course, binding on the promoters equally with the competitors, though this rule is by no means invariably observed. The chief elevation faces Nelson-street, with return facades to Dunsen-street and Caledonia-street, the site at the rear being bounded by Bowling Beck, a narrow passage which will be widened. The total outlay is limited to £15,000. A premium of £100 for the first design, £50 for the second, and £30 for the design third in order of merit. A builder's *bond-fide* tender to be obtained to confirm the correctness of the estimate. The accommodation provides for an engine-house for five engines, a duty room, stable for eight horses, a recreation room and hayloft on the first floor. The chief officer's house and superintendent's house to be included in the scheme, with 24 dwellings in flats, a hose-tower, workshops, laundry, and additional stabling for six horses, as well as conveniences for the men in the yard. The second premium was awarded to Mr. W. J. Morley, F.R.I.B.A., of Bradford, and the third prize was given to Mr. Owen Roberts, of Liverpool. From the information sent us, it would appear that three schemes were prepared by Messrs. Mawson and Hudson, and the complaint is not so much that alternative plans were made—for that, surely, was allowable—but that no individual design was accepted, the first premium being given, it is asserted, for the three plans collectively. This must surely be due to a misapprehension? A protest, however, appears elsewhere, which certainly assumes that this was so. No official communication as to the award had been received by some of the competitors up to Wednesday; the result only reached them through the Bradford papers.

LEEDS.—The corporation are offering premiums of £150, £100, and £50 for the three best designs sent in for the erection of a market hall and market shops on a site 4,560 square yards, which forms part of the present Kirkgate Market.

MORECAMBE.—In a recent public competition for a convalescent home at Morecambe, for the Girls' Friendly Society of the Ripon Diocese, the design of Mr. Edward C. H. Maidman, architect, of Edinburgh, was selected, and he has been instructed to proceed with the work as quickly as possible.

SHOREDITCH.—The town-hall extensions competition at Shoreditch does not appear to make a very attractive project for architects, seeing that, to begin with, no elevations or sections of the existing buildings are furnished to competitors, who will consequently have to take their own particulars, and it is specified that the new part must be made to conform with the design of the facade of the old building. A plan of the ground floor is furnished with the conditions, but, inasmuch as the other floors enter most intimately into the project, which must be considered as a whole, including recasting of the officials' offices, it would only appear reasonable that competitors should have been supplied with measured dia-

grams to scale, at any rate. Beyond the additional offices, several extra committee-rooms are to be provided, and rooms for the caretaker. £12,000 is the limit. A turret or tower is suggested, provided the money will allow, which is very doubtful. How far any outsider can adequately understand to what extent the rearrangement of the offices is really intended is also a matter of great uncertainty. With a new building the actual intentions of the promoters is always more or less a question, but with an alteration job such as the Shoreditch town-hall this difficulty seems most speculative. No professional referee is guaranteed, and the premiums are £50 and £25. March 22nd is the day for sending in.

#### PROFESSIONAL AND TRADE SOCIETIES.

THE ARCHITECTURAL ASSOCIATION.—The ninth meeting for the present session of the Association was held on Friday evening at 9, Conduit-street, W., Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the chair. A vote of thanks was accorded to Mr. H. L. Florence for allowing the recent Saturday afternoon visit of the members to the new Carlton Hotel in the Haymarket. The President called attention to the class on Colour Decoration, to be conducted by Mr. Alfred H. Hart, and to be opened on Wednesday, March 8. The subject was of great interest, the fee very low, and he trusted that many members would support the course, and do all they could to make it a success. A donation to the library of "English Cathedrals, Illustrated," by the author, Mr. Francis Bond, M.A., was acknowledged with thanks. Mr. Cole A. Adams, F.R.I.B.A., then delivered a lecture addressed to students under the title of "A Chat About Colour Decoration," explaining that he proposed to speak of some of the various methods adopted in colour decoration, and to offer a few practical suggestions which might be of use in the study of the subject. The paper is fully reported on p. 260, *ante*. A vote of thanks was accorded the lecturer on the motion of Mr. L. A. Shuffey, seconded by Mr. J. D. Crace, and supported by Mr. Hampden W. Pratt, Mr. E. Howley Sim, and Mr. Matt Garbutt. Mr. Pratt, in his remarks, referred to the works of decoration now in progress at St. Paul's Cathedral, and declared that it was time to speak as to the manner in which a building was being ruined by a great artist, who had no one to control him in his works. Mr. Cole Adams briefly replied.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—A meeting of this Association was held in the Grosvenor Hotel, Westland-row, on Tuesday evening last, Mr. Geo. P. Sheridan, A.R.I.B.A., vice-president, in the chair. Mr. R. M. Butler, hon. sec., read a paper entitled "The Influence of Climate and Material on National Architecture." This paper was awarded the "Essay Prize" of the Association for 1897. The lecture was illustrated by lantern views, and the subject very fully dealt with. The lecturer showed that in all great periods of architecture the influences of climate and material had exercised a large influence over the art of building. That it was only when the art became corrupted and enervated, and when mere copyism was called design, that these principles ceased to govern design. Likewise the lecturer showed that the social conditions and requirements of the people had had in all times exercised an immense influence on their buildings. Messrs. Walter Doolin and Joseph Holloway having spoken in very complimentary terms of the paper, a hearty vote of thanks to the lecturer was passed unanimously.

BRISTOL SOCIETY OF ARCHITECTS.—The monthly meeting of this society was held at the Fine Arts Academy on Wednesday, the 15th inst., when the question of the competition for the proposed new library was discussed, and, after hearing the report of the deputation to the Libraries' Committee, it was resolved that in default of an independent professional assessor being appointed, the original determination not to compete be adhered to. Surprise was expressed that the Libraries Committee had refused to accede to so reasonable a request, the ostensible intention of the competition being to obtain the best design. Mr. Arthur Lee, J.P., read an interesting paper on "Marble Decoration," profusely illustrated by lantern views. The proceedings terminated with a hearty vote of thanks to Mr. Lee, on the motion of the President, seconded by the vice-president, and supported by Mr. Frank Wills,

# THE BOYLE SYSTEM OF VENTILATION As applied to SEWERS (Suburban).

A. Boyle's Patent "Air Pump" Ventilator, (Upcast).

B. Upcast Shaft connected with top of Manhole, or Sewer, carried above level of top windows.

C. Boyle's Patent Domestick Ventilator, for catching the Wind from every quarter and driving it down the Shaft D into the Sewer, which is divided into sections, each about 300 feet in length, by Boyle's Triple Flight Flap Valve E.

Each section is ventilated separately. The sizes of the Ventilators and the diameters of the pipes are determined by the size of the Sewer.

E. The Boyle Triple Flight Flap Valve.

the latter of whom strongly endorsed the remarks of the lecturer with reference to municipal buildings.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS. — The monthly meeting of this society was held on the 14th inst., at the School of Art, Mr. R. W. Fowler in the chair. Mr. P. Marshall, F.S.I., gave a lecture on "Surveying." The lecturer gave a detailed description of the work done by surveyors of 150 to 200 years ago, and the character and beautiful workmanship of

the finished plans of that period. He illustrated the manner in which the surveys were carried out from that period to the beginning of the present century, and explained how the plans were prepared by these early surveyors and the various details connecting therewith, contrasting the amount of labour expended upon the finished plans of that period with those prepared in these hurried times. After referring to the work done by the surveyors in the inclosures of the commons and waste lands of England, he

gave a detailed description as to how the surveys of these commons were made, the manner of laying out the roads and dealing with the rights of way across the same, also the way in which the surveyors valued the commons for dealing with the commoners' rights, and also the allotting and setting out the plots apportioned to them. He also gave an outline of the work done by the Commissioners and the hearing of claims, and as to what these claims consisted of, and explained how the lands were allotted in lieu of

those rights. The different methods adopted in meeting the expenditure incurred by the Commissioners in their work were then shown. He described the various systems of modern surveying, and their application to the surveys of country estates and property in towns, and specially explained the applicability of traversing with the theodolite for these surveys, with advice as to how the same should be carried out. Proceeding, he laid down what in his opinion was the best mode of preparing Parliamentary plans for engineering and other uses, and in particular the making of the surveys required for the working plans for railways and other works. He next gave advice as to preparing the cartoons for Parliamentary and other purposes, which are used in the illustration of works before committees of the Houses of Parliament and other tribunals, completing his paper with a brief description of how the Ordnance Survey of England was carried out, and the details shown on the published maps. On the motion of Mr. Fred Fowler, seconded by Mr. C. Hadfield, and supported by Mr. H. Vickers, a hearty vote of thanks was given to the lecturer.

**THE INCORPORATED INSTITUTE OF BRITISH DECORATORS.**—The idea of forming an institute for those engaged in the art and business of painted decoration, and having objects allied to those with which the institutes, such as those of engineers, of architects, and of surveyors have been formed, seems to have originated within the present decade, and to have taken more definite shape at a meeting of the National Association of Master Painters at Manchester in 1894. Endeavours were made to obtain a charter last year; but objections being found, it was decided to incorporate the institute under the non-trading clauses of the Limited Companies Act; and, after some years of persevering effort, the institute was finally registered as incorporated on January 21 this year. The first meeting of the provisional council since incorporation was held at Painters' Hall on February 8. This council, consisting of 25 members, is representative of England and Wales, Scotland and Ireland, Mr. Grace, of London, being president. They at once proceeded to elect officers and arrange for the organisation and working of the institute. Mr. W. H. Pitman was elected treasurer; Mr. G. Petter, auditor; and Mr. F. W. Englefield (of Messrs. Pritchard, Englefield and Company, solicitors), secretary. The first general meeting is appointed for March 23 at Painters' Hall, Little Trinity-lane, where the new institute's headquarters will for the present be situated.

#### CHIPS.

The new schools, Heath Town, Wolverhampton, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The net value of the estate of the late Samuel Bayliss, of No. 5, Hanover-terrace, Regent's Park, civil engineer and contractor, Associate of the Institution of Civil Engineers, and Member of the Imperial Order of the Medjidi of the Ottoman Empire, has been sworn at the sum of £545,849 11s. 3d.

The Urnston Urban District Council have appointed Mr. James Heath, of Ashton-on-Mersey, as surveyor and sanitary inspector at a salary of £120 per annum. There were 42 applicants for the position.

At the Hampshire Assizes, last week, Charles Jobbins, builder, of Lee-on-the-Solent, was awarded £300 damages for slander in an action brought against Samuel C. Gale, auctioneer and surveyor, of the same place. Defendant, it was alleged, saw a commercial traveller named Howell, then in the employ of Messrs. Bailey and Messrs. White, of Portsmouth, and told him that Messrs. Pearson, a firm of builders at Notting Hill, had "closed down" on plaintiff, and that they were not the only ones. At defendant's suggestion Mr. Howell went to the railway station and stopped some timber consigned to plaintiff.

Messrs. Levatt and Co., of London, have secured from the Admiralty a contract to build the new naval barracks at Portsea, which are to replace the present wooden hulks as a naval depot for the port. The barracks are to accommodate 4,800 men, will occupy four years in erection, and are to cost £400,000.

The urban district council of Llandudno have decided to construct a new relief sewer to East Llandudno, in accordance with plans prepared by their surveyor, Mr. Stephenson, at an estimated cost of £11,600.

## Building Intelligence.

**BATLEY.**—The special sub-committee appointed recently by the corporation to take the initial steps towards the provision of a new town-hall for the borough have visited several Yorkshire townships where municipal buildings have been erected during the past few years. They have reported, and are now under instructions from the general purposes committee, comprising the whole of the members of the council, to consult Mr. Walter Hanstock, of that town, with a view to laying a scheme before the corporation. Mr. Hanstock will prepare sketch-plans of an entirely new building, and will also report to the council concerning the market estate as the probable site.

**BOMBAY.**—The new administration offices for the Bombay, Baroda, and Central India Railway Company have been recently completed near the Church Gate Street Station. The work was begun in April, 1894, and the surrounding garden has yet to be laid out. The principal façade, 300ft. long; has a tower 160ft. high rising from amidst the many dazzling white domes. The building is in the Gothic style, with Oriental feeling, and has been designed in harmony with the surrounding public buildings—a condition laid down by the Government of India. The structure is faced with blue basalt stone, and the domes, mouldings, and carved work are of white Porebunder stone. The tower, which can be seen from all parts of Bombay, is square from its base for the first hundred feet, then takes an octagonal form up to the springing of the dome. Crowning the central cupola is a group of figurative sculpture representing "Engineering," a work which has been executed by Mr. Roscoe Mullins. In the circular panels between the arches of the central carriage porch are two carved heads in full relief of Colonel French and Colonel Kennedy, which have also been executed by Mr. Mullins. Three floors of the building have been set apart for office purposes, and in the centre is an extra floor for records. On the ground floor, the traffic, police, medical, and cashier's departments are accommodated; the first floor is set apart for the agent's and engineering departments and the finely-decorated board-room, and on the second floor the accounts and audit departments and the Government Examiner of Accounts are housed, whilst space is also found for a library and an officer's tiffin-room. The architect for the building is Mr. F. W. Stevens, C.I.E., F.R.I.B.A., who has been assisted by his son, Mr. C. F. Stevens, M.S.A., and the total cost has been 6½ lakhs of rupees.

**DOUGLAS, I.M.**—The directors of the Isle of Man Banking Company, Ltd., having decided to erect new head offices in Douglas, made a tour of the chief cities in England and Scotland, and decided to build on the model of the Northern Assurance Company's premises at the corner of Union-street, Aberdeen. They accordingly instructed the architect of the edifice, Mr. Marshall Mackenzie, A.R.S.A., to prepare plans for a building to be faced with Aberdeen granite, and to cost about £13,000 in execution. The offices are to be built at the junction of the principal thoroughfares, Athol-street and Prospect Hill. It is intended to commence its erection at Whitsuntide, when the company obtains possession of the site. The style is Renaissance, and the whole exterior will be executed in finely-axed granite, while the interior of the lobby will be of polished granite, and of different varieties as to colour. All the granite work of the two elaborate fronts will be dressed in Aberdeen, and will be sent to Douglas by sea. On the ground floor the bank offices will be located, and the two upper floors will be let out as business offices. The angle to the streets will be rounded above the corner entrance, a range of four columns being carried up through the two floors over the doorway, and a uniform open balustrade will be carried along the two sides of the building, the piers between the windows being continued through the frieze.

**HYDE.**—The new building for the technical school and free library was opened on Saturday afternoon. The premises, which are in Union-street and near the Corporation baths and the Mechanics' Institute, have been erected at a cost of about £13,000. Of this sum the Corporation provided £5,000, and £1,640 was obtained from the old Mechanics' Institute. The new building has accommodation for 1,000 students. In the

basement are rooms for laundry work, cooking, dressmaking, and art-modelling. The ground-floor has a reading-room, ladies' room, lending department of the library, the librarian's room, the secretary's office, committee-room, and the building construction and machine construction departments. On the first floor are the chemical laboratory, the chemical theatre for scientific lectures, the chemical master's room, the physical laboratory, the elementary art room, and the advanced art department and the art-master's room. The architects were Messrs. Woodhouse and Willoughby, of Manchester. We illustrated the building in our issue of Feb. 28, 1896.

**RUGBY.**—The urban district council are in a dilemma with regard to the municipal buildings they propose to erect on the site of the Shoulder of Mutton Inn, High-street, bequeathed to the town by the late Mr. G. C. Benn. The donor expressed no wish beyond that the buildings should be some likely benefit to the town. The council decided on offices for their servants and a chamber for themselves, and a town's meeting condemned the proposal. The clerk was instructed to draw up a statement of the council's position for publication, and he unearthed a letter from Mr. B. H. C. Fox (Mr. Benn's legatee) in which that gentleman said he knew what Mr. Benn's wishes were. This letter was written in 1896, and the council at the time decided that a deputation should wait on Mr. Fox. The council, at their last meeting, instructed the clerk to ask Mr. Fox to receive the deputation now; but he has declined, and he reminds the council of Mr. Benn's wish that the gift, though unconditional, was intended to be for the benefit of the town. In addition to the site, Mr. Benn left £4,000 to erect buildings thereon, and £2,000 to maintain them. The council advertised for competitive designs for the buildings, the estimated cost of which was not to exceed £5,000, and they selected plans by Messrs. North and Hawk, of Battersea, from the 39 sets sent in. The estimate was exceeded, and they applied to the Local Government Board for sanction to borrow £3,000 to meet the additional cost. Now, however, it is found that the lowest cost will be between £8,000 and £9,000, and the council are reluctant to apply, in the face of present feeling, for sanction to borrow another £3,000.

**STONE, KENT.**—The Corporation of London have decided to make improvements at the City of London Lunatic Asylum at Stone, near Dartford, at a cost of £85,850. The original estimate—£70,000—which the Common Council accepted in October, 1897, included £12,095 for the warming, heating, lighting, and engineering works in connection with the new building; but further inquiry has led to the condemnation of existing boilers, which have been in use since 1865, and to the introduction of an entirely new system. This, together with the installation of the electric light in the Asylum, has necessitated an increase in the expenses of £15,850, bringing the total to £85,850. A report sanctioning that enhancement has been adopted by the corporation.

**WELLINGTON, SALOP.**—There are many signs of building activity in this town and its neighbourhood. The extensive steelworks at Hadley, formerly belonging to Messrs. Nettlefold, which have been closed since November, 1890, have been purchased by Messrs. G. F. Milnes and Co., of Birkenhead, who will manufacture electric tramcars, omnibuses, &c. Messrs. Milnes have also purchased over twenty acres of land adjoining for the erection of workshops. From 600 to 700 men will be drafted into the Wellington district, and a further 200 will be employed by the extension of large ironworks in the district. A scheme has been formulated by Dr. Whittaker (medical officer of health for the district) and Mr. Myles Morley (surveyor to the Wellington urban district council) to erect 60 workmen's dwellings, to be let at rents varying from 4s. to 7s. per week. To carry out this most of the dilapidated cottages in the town, 40 of which have been condemned as unfit for human habitation, will be demolished. A more extensive scheme is being undertaken by a syndicate to acquire the Vicarage Estate, situated on the old Watling-street Road, not half a mile from the foot of the Wrekin. It is proposed to erect detached villa residences on the estate, and upwards of £100,000 will be expended. Building operations will commence almost immediately. Mr. Dalgleish, architect, of Wellington and Shrewsbury, has been instructed in connection with the several building schemes.

**YORK.**—A fresh appeal has been issued for completing the work of restoring and rebuilding at the Cathedral, and the Dean and Chapter hope eventually to raise a sum of £50,000. A preliminary appeal to those directly connected with the Minster has brought in £5,000, and another £8,000 has since been promised. The appeal now being issued shows what has been done already (at a total cost of more than £100,000) and what it is proposed to do. Appended to the appeal is a report by the architect to the Dean and Chapter, Mr. G. F. Bodley, A.R.A., who suggests that the £50,000, if obtained, should be invested, and the interest, say £1,250 per annum added to the present fabric fund of between £700 and £800 a year, so as to place the authorities in a position to deal with the repairs in a better manner. The latest work done, the rebuilding of the pinnacles on the south side of nave, cost about £200 each; Mr. Bodley added that he should much like to complete the six flying buttresses on the south side and the pinnacles and flying buttresses on the north side; the former would cost £400 and the latter £200 each. The restoration of the pinnacle at the east end, together with the adjacent pinnacles and parapets, would cost £700 or £800. The west front, central tower, and nave and choir parapets are also all in need of repair, and the cost would be large.

## Engineering Notes.

**LEITH.**—Since the North British Railway obtained possession, in May last, of the ground between the foot of Easter-road and the foot of Leith-walk, Leith, in connection with the construction of their new line between Edinburgh and Leith, considerable progress has been made, not only with the railway, but with the passenger station buildings at the corner of Leith-walk and Duke-street, and the consequent widening and improvement of a portion of these thoroughfares. The work involved the demolition of most of the property contained in an oblong area between Glover-street and the foot of Leith-walk, and from there to Whitfield-lane, and some property between Easter-road and Glover-street. To accommodate the tenants of the dwelling-houses demolished, large blocks of tenements were erected at Halmyle-street and Lorne-street. Building at Easter-road in connection with the laying of the new line (Contract No. 1) was commenced about the middle of July last, and is being pushed forward as rapidly as possible. Two abutments have been erected at Easter-road, and the walls are forward nearly to Leith-walk. The west abutment is 113ft. long by 16ft. high, and 9ft. 6in. thick, and the east abutment is 61ft. long and the same height and width as the west abutment, with wing walls of about 50ft. long, an average width of 6ft., and a height of 24ft., with parapet ashlar on the top. Some of the stones in connection with this work are over four tons in weight. The walls of the subway from Easter-road to the station at the foot of Leith-walk are well advanced, 450ft. of the walls, which are 18ft. high and 5ft. thick, having been built. These walls are lined with white enamelled brick. Of the north retaining wall, 676ft., extending to the summit of the north station wall, has been built, with a height of 16ft. and a width of 6ft. The south retaining wall is also well advanced, 780ft. having been built, of the same height and thickness as the north wall. Both walls are up to the level of the hewn work for starting the station wall, which has been begun. The retaining walls are up to the level of the rails, and are filled up with excavations from railway cuttings. The erection of the station buildings (contract No. 2) is also making satisfactory progress. From the new corner at Whitfield-lane to the foot of Leith-walk a space of about 192ft. has been taken in, and from the corner of Leith-walk and Duke-street about 218ft. of Duke-street has been taken in. After taking down the property on these portions of Leith-walk and Duke-street, excavations were made for the erection of a large retaining wall for the platform. This wall is now up to the platform level, and is built at the foot of concrete 7ft. 6in. broad and 3ft. deep, with stone foundations 5ft., 12in. deep. Above that is rubble building up to 12in. below the ground floor, and coated with asphalt. The foundations are laid with a  $\frac{3}{4}$ in. coat of asphalt, and then with a pavement course 3in. thick all over, jointed and bedded

with cement. All the walls are built with cement, and no lime is used. The length of the Duke-street portion of the retaining wall is about 178ft., and that of the Leith-walk section about 155ft., the whole being now up to platform level. The frontage of the station buildings to Duke-street is about 218ft., and is built partly to the first and second story. The frontage to Leith-walk will be about 190ft. when finished. On the elevation to Leith-walk nine piers, extending from Whitfield-lane, have been erected up to the first-floor level. The stone for the buildings has been brought from Alloa quarries. Some of the shops on the ground floor of the station buildings will be ready for occupancy by May next, and the whole of the operations in connection with the new line will be completed in about three years' time. The contractors for Contract No. 1 (the laying of the new line) are Messrs. Young and Son, Edinburgh; and the contractors for Contract No. 2 are Messrs. Cousin, Edinburgh, who have the contract for the new Waverley Station, Edinburgh. Messrs. Blyth and Westland, C.E., Edinburgh, are the architects and engineers for both contracts.

**RHYL.**—The London and North-Western Railway Company are about to make great additions and improvements to the present inadequate railway station. The scheme includes the provision of a double set of rails, one for fast and one for local traffic. The station will be almost entirely reconstructed. The down platform, to occupy the site of the present goods shed, will be 1,000ft. by 80ft. At the west end of the platform, a bay will be constructed 500ft. long, with two platforms each 25ft. wide. These latter will be devoted to passengers using the Vale of Clwyd line. Other features of the down platform will be the erection of a building of red pressed bricks and terracotta dressing, containing waiting-room, booking-office, cellars, lavatories, &c. The up platform will be lengthened to 1,300ft., and also considerably widened, and the two platforms will be connected with a bridge, built in two portions, one for the use of passengers and the other for luggage, which will be raised and lowered to and from the bridge by hydraulic lifts. Messrs. Gates and Thomas, of Warrington, have secured the contract, which will occupy two years in completion.

### CHIPS.

New buildings are being erected for the Wholesale Co-operative Society at Silverton, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

The freedom of the Plumbers' Company will be presented to Sir Hugh Owen, late secretary to the Local Government Board, at the Guildhall to-day (Friday). Mr. H. Chaplin, the Lord Mayor, the chairman of the London County Council, and others will be present at the ceremony of presentation.

In the cemetery at Candie, Guernsey, a figure of an Angel of Glory, sculptured in Carrara marble, has been erected over the grave of Mrs. John Shaw. The work was executed by Messrs. Harry Hems and Sons, of Exeter.

New buildings are about to be built in Union-street, Aberdeen, for the Scottish Temperance Assurance Co., from plans by Messrs. Jenkins and Marr, of that city. The building will be Free Classic in style, and will have a façade 34ft. in breadth, and carried to a height of 70ft., and a depth of 92ft. The primary material will be dressed granite, and the cost will be about £5,000.

The town council of Widnes decided on Tuesday to raise the salary of their gas and water engineer, Mr. Isaac Carr, M.Inst.C.E., by £150 per annum.

A large turret Cambridge quarter-chime clock, made by Messrs. W. Potts and Sons, of Leeds, under the directions of the urban district council, was started at noon on Saturday at Skipton-in-Craven (West Yorkshire) Parish Church. The clock shows the time on two external dials, the largest of which is 12ft. in diameter, facing south, and the west dial rather smaller; also a small dial on the face of the clock inside, and one in the chamber below for the use of the ringers. The clock strikes the hours and Cambridge quarters. It has the gravity escapement, with compensation pendulum, and all the latest improvements.

The Art Loan Exhibition at the City Guildhall Art Gallery, the principal feature of which will be a representative collection of the works of the great painter, Turner, will be opened by the Lord Mayor on Monday, April 10. In addition to some of the most notable specimens of Turner's works, there will be a collection of the most striking pictures painted by his contemporaries Gainsborough, Romney, and Constable.

### LEGAL INTELLIGENCE.

**WHAT IS A "NEW STREET"?**—At North London Police-court, on Monday, Mr. E. S. Fordham gave his decision in a case in which the Hackney Vestry sued Mr. Stower, an owner of house property in Grove-lane, Hackney, and others for £202, their apportionments in respect of the making up of the road as a new street. The defence was non-liability, because the road had been in existence prior to the Metropolis Local Management Act of 1862, Section 93 of which held that all new roads should be 40ft. in width, unless (section 99) otherwise sanctioned by the Metropolitan Board of Works (now the London County Council). No such permission had been asked or given; and houses had existed in the lane for many years. For the Vestry it was argued that the character of the place had been altered by reason of the erection of dwellings, which had been built in conformity with the Act, 20ft. from the centre of the road. Mr. Fordham, in his judgment, said the question for him to decide was whether Grove-lane was a new street under the Metropolis Local Management Act, so as to make the owners of property abutting upon it liable to pay for paving it. From the plans laid before him by the Vestry he was inclined to think it was not a new street; but on personally viewing it he was at once satisfied that it was a new street in the ordinary and proper sense of the term, because of the erection of the Great Eastern-buildings along a considerable length of one side. An order was made for the amount claimed, with costs.

**A PLASTERER'S BREACH OF CONTRACT.**—Before his Honour Judge Woodfall, at Plymouth, on the 15th inst., James Martin, builder, of Croppin's Park-terrace, Plymouth, sued H. W. L. Lacey, plasterer, for £40, damages for breach of agreement. Plaintiff's case was that defendant agreed to do the plastering of all the five-roomed houses on the Ashford Estate, Mutley, which plaintiff built, at £19 a house. Before he had completed his undertaking he found another job under Messrs. Pethick, and abandoned his contract, after having completed six and partially plastered two. The defence was the agreement was to plaster three houses, which he completed, for £43 a house. It was denied that the agreement was to plaster as many houses as plaintiff built on the estate. Defendant said, having regard to the scarcity of plasterers, it would not pay him to do such houses at £19 each. Judgment for plaintiff for £20 and costs.

**PARLIAMENT-STREET ARBITRATION AWARD.**—A compensation claim against her Majesty's Office of Works in respect of the Whitehall improvement scheme was recently made by Messrs. Maynell and Pemberton, solicitors, who claimed £14,000 for the demolition of their office premises, No. 20, Whitehall-place. The claimant firm, which had existed at the address mentioned since 1835, had secured a Crown lease for a term of 99 years from July, 1820, at a rental of £98 6s. 9d. per annum. At the end of 1896 the Commissioners of Works served the usual notice to treat. The matter was referred to Mr. Robert Vigers, president of the Surveyor's Institution, who acted as sole arbitrator, and in the course of the inquiry it was submitted that the premises were worth £950 or £1,000 a year to the claimants as occupying tenants. Evidence in support of the claim was given by Mr. G. H. Brougham Glasier, F.S.I. (Messrs. Glasier and Sons), Mr. Edward Tewson, F.S.I. (Messrs. Dabenhams, Tewson, Farmer, and Bridgewater), and Mr. H. C. Trollope, F.S.I. (Messrs. Trollope), whose valuations ranged from £6,000 to £12,000. Expert evidence on behalf of the Crown was given by Mr. W. E. Horne, F.S.I. (Messrs. Horne and Co.), Mr. James Green, F.S.I. (Messrs. Weatherall and Green), Mr. W. H. Elwell, F.S.I., surveyor to the Great Northern Railway Company, and Mr. J. H. Sherwin, F.S.I., Whitehall-place. The arbitrator has just awarded the claimants £3,478.

**THE LONDON COUNTY COUNCIL v. DIXON.**—(Queen's Bench Division, Feb. 15, before Mr. Justice Lawrence and Mr. Justice Channell.)—This was a case stated by the Metropolitan police magistrate at Greenwich. An information was laid against John Dixon, the respondent, charging him that he, in May, 1893, at Sandhurst-road, did commence to form a street for carriage traffic leading out of Sandhurst-road without having obtained the sanction of the County Council, contrary to sections 7 and 8 of the London Building Act, 1894. Sandhurst-road is a new street laid out upon property belonging to Mr. A. Cameron Corbett. In May, 1893, a row of houses had been erected in Sandhurst-road. In that month the respondent commenced the erection of six shops upon land bought from Mr. Corbett. The shops were erected with a frontage to Sandhurst-road, and upon the same side of it as the row of houses already referred to. A space of 40ft., as left required by the Act for a carriage way, was left between the last of the houses and the first of the shops. This space was what was alleged to be the street commenced by the respondent. The shop at the corner has a doorway at the angle, and a shop window and other windows of the house over the

shop look into the space. There is also a door opening into the space at a distance of 10ft. or 12ft. from the Sandhurst-road, and five coach-houses and stables have been erected at the back of the premises, the only access to which for horses and carriages is by an entrance 80ft. down the alleged street. The alleged street is the property of Mr. Corbett, and a certain portion of it is used as a cart-track communicating with certain brickfields situated at the end of the alleged street, which is about 90ft. in length. There was no evidence that Mr. Corbett had entered into any agreement with the respondent that the space forming the alleged street should be left open, but this alleged street was marked on the estate plan of Mr. Corbett's estate as "proposed street." Nothing had been done by the respondent to form or lay out the alleged street except the building of the shops and stables. The requirement of section 7 was not complied with. The magistrate found as a fact that, in the circumstances, a new street for carriage traffic had been commenced to be formed and laid out, but that, though the respondent undoubtedly erected the shops in the expectation that the space would be a new street, yet he did not commence to form it, on the ground that he had no control of the roadway of the alleged street. Mr. Avory contended that, inasmuch as the magistrate had found as a fact that a new street had been commenced to be formed and laid out, the only question was who commenced to so form and lay it out. It was clear that Mr. Corbett did not, for he had done nothing. The person who commenced to form and lay out the street then was the respondent. He said that the Act was framed in order to enable the County Council to take steps to enforce the provisions of the Act before any expense had been incurred by owners or builders, and it was also framed to catch the builder who built on land adjoining a proposed street as well as the owner of the roadway. He cited "St. George's Local Board v. Ballard," and "Roberts v. Richards." Mr. R. C. Glen, for the respondent, contended that his client did not commence to form or lay out a street within the meaning of the Act, and that if he came within section 8 he was exempted by the proviso. He cited "Gozzett v. Malden Urban Sanitary Authority." The court dismissed the appeal. Mr. Justice Channell said that the section was framed in the broadest way, and, without the proviso, it would include cases which created an obvious absurdity, because any house built upon any land might at some time or other become one of three or more other houses abutting upon land on which a street might at some time be laid out or formed. But the proviso saved the section from this vagueness. A man might be said to do acts for a purpose other than that of forming or laying out a street within the meaning of the proviso when he did them for a usual purpose—that was to say, when, knowing that some other persons might build houses near him, he built his house so that it would be equally suitable whether the adjacent land were ultimately turned into a street or the contrary. In this case the respondent had obtained his land on such terms that he was entitled to a right of way to his stables; but, knowing that the land over which the right of way passed was likely to become a street, he so built his house as to be suitable in that eventuality.

**WHITWELL METHODISTS AND THEIR ARCHITECT.**—At Worksop County-court, on the 7th inst., Augustus George Taylor, architect and surveyor, of New Brighton, formerly of Whitwell, Derbyshire, sued Mr. S. Clarke, of Worksop, and others, trustees of the Free Methodist Chapel, Whitwell, for £32 10s., for preparing a plan of a proposed new chapel at Whitwell, and drawing up a bill of quantities for the same. Plaintiff alleged that he was ordered by the trustees to prepare the plan produced. He estimated the cost of the building at £1,300, and for preparing the plan he had charged one per cent. He was also ordered by the trustees to prepare a bill of quantities required, and for this work he had charged 1½ per cent. on the estimated cost of the building, or £19 10s., making in all £32 10s. He considered the charge perfectly reasonable. For the defence it was alleged that plaintiff had informed the trustees that he would prepare an estimate of the cost of the proposed building for a very small sum, that the charge made was most extortionate, that the plan was practically useless and unworkable, being entirely without specifications, whilst the bill of quantities prepared was only a rough sketch of what would be required. His Honour considered it a very fortunate thing that the trustees had not attempted to build with plaintiff's plan, and he considered that the defendants had behaved handsomely in the matter in paying £20 into court. There would be judgment for defendants with costs.

**QUANTITY SURVEYORS' CHARGES.**—**RAVEN AND ANOTHER V. MUNDAY AND SONS.**—The plaintiffs in this case, heard by Mr. Justice Darling in the Queen's Bench Division on Monday, were quantity surveyors, and the defendants were builders and contractors. In 1894 the City of London wanted buildings constructed at Deptford Meat Market; and the defendants carried out the work at a cost of

about £20,000. In reference to the works differences arose, and claims were made upon the one side and the other. There were also additions and omissions in reference to the contract, and the plaintiffs did a good deal of work as quantity surveyors in connection with the work. In this condition of things the city solicitor offered to recommend the city committee to settle the whole matter in dispute by a payment of £5,000; and this proposal was accepted by the defendants, and the money was paid to them. The plaintiffs now sued the defendants for money had and received upon their account, their contention being that the amount paid to the defendants to settle the whole of the matters in dispute must be taken to include the amount due to the plaintiffs for the work they had done, in the course of the building operations, as quantity surveyors. The defendants, on their part, denied that in the course of the settlement of the various claims they had incurred any responsibility to pay the amount claimed by the plaintiffs. Mr. Justice Darling, having heard the evidence on both sides, gave judgment for the plaintiffs for £299 14s. 3d.

**ARBITRATION AT BEXHILL.**—At the Surveyors' Institution, on Wednesday week, Mr. Daniel Watney sat as the sole arbitrator in the case of "Squirrell v. the Crowhurst, Sidley, and Bexhill Railway Company," a claim for compensation in respect of about nine acres of land on the Wakeham's Farm Estate, Sidley, Bexhill. Mr. H. T. Squirrell, the claimant, stated that the development of Bexhill during the last ten years had been phenomenal. The land in question, and in respect of which the net compensation asked for amounted to about £15,000, had been dealt with in comparatively recent years at a very low price, and, though it was over a mile from the seashore, there was a keen demand for sites for houses of from £40 to £50 a year. The development of the estate had been greatly retarded by the uncertainty as to which portion of it the railway would traverse, but, since this point has been settled, numerous sales of sites had been effected at prices which worked out at from £2,700 to £3,000 per acre and upwards. Mr. William Hurst Flint (Humbert and Flint) produced a detailed valuation of the property, and expressed the opinion that it could have been developed rapidly and advantageously. Further evidence was adduced on Wednesday on behalf of the claimant. Mr. James Woodhams (T. H. Woodhams and Sons) estimated the value of the land in question at £18,056, from which he deducted the cost of developing the property as a building estate, leaving a net value of £13,767, which he deferred for three years on the 4 per cent. table, representing in present money £12,238. To this he added the customary 10 per cent. for compulsory sale, £1,223, giving a total of £13,461. Confirmatory evidence was given by Mr. J. B. Wall, A.R.I.B.A., Mr. George W. Veness, Mr. Dodgson Graves, and other experts, and the case for the claimant was concluded. On behalf of the railway company, Mr. G. Humphreys Davies (Humphreys, Davies, and Co.), expressed the opinion that no practical man would buy the land in question as a building speculation at more than £300 an acre. It was all back land, and would be difficult and expensive to develop. It would be many years before the land would be ripe for building. He valued the land taken—9a. 1r. 29p., at £300 per acre—at £2,829, to which he added the customary allowance of 10 per cent. for compulsory sale, and £86 for the severance of a small piece of land, making a total of £3,197. The case was adjourned.

**PUBLIC HEALTH ACT APPEAL.**—**ROBINSON V. SUNDERLAND CORPORATION.**—In the Queen's Bench Division, on Friday, Mr. Justice Lawrence and Mr. Justice Channell heard an appeal from a decision by the Magistrates of Sunderland, under section 305 of the Public Health Act, 1875, for an order authorising the respondents, the Sunderland Corporation, to enter 31, East-street, the property of the appellant, a Mr. Robinson, for the purpose of making plans, surveying, and measuring and making certain work. The respondents, acting under section 36 of the Public Health Act, 1875, upon the report of their inspector of nuisances, had served notice on the appellant, requiring him to provide for the said house a sufficient water-closet, and an ashpit furnished with proper doors and coverings. The notice was not complied with, and the respondents determined to execute the works themselves. The respondents' borough surveyor applied to the appellant for permission to make an entry and examination for these purposes, but the appellant refused such admission. The respondents, thereupon, after due notice to the appellant, applied to the justices under section 305 for an order authorising the necessary entry. At the hearing of the application, evidence was tendered on behalf of the appellant as to the condition of his house and as to the sufficiency of a privy and ashpit there. On behalf of the respondents, the admission of this evidence was objected to on the ground that the question of the sufficiency of the privy and ashpit was a matter to be decided by the respondents under section 36 of the Public Health Act, 1875,

subject only to appeal to the Local Government Board under section 268, and that the respondents having jurisdiction under section 36 to give the notice in question in this matter, the justices could not review such notice, and were not entitled to receive evidence as to the sufficiency of the privy and ashpit. In support of this contention "St. Luke's (Middlesex) Vestry," "Sherborne Local Board v. Bogle," and "ex parte Whitechurch" were cited. The justices being of opinion that they were not entitled to review the decision of the local authority as to the sufficiency of the privy and ashpit, declined to hear evidence thereon, and made the order sought for. They, however, stated the present case for the opinion of the High Court as to whether they were right in refusing to receive the evidence. Mr. Scott Fox, Q.C., for the appellant, contended that the magistrates were wrong in refusing to hear the evidence. On the question as to the power of justices to state a case "Diss Urban Authority v. Aldrich," was referred to. Mr. Tindal Atkinson, Q.C., for the respondents, said the jurisdiction of the magistrates was limited to the inquiry whether it was necessary for the purpose of doing the works for the local authority to enter. He cited "Cooper v. Wandsworth Local Board," and "St. James Vestry v. Feary." The respondent had not applied to the local authority for a hearing. "Hargreaves v. Taylor," "Wood v. Widnes Corporation," and "Attorney-General v. Hooper," were also cited. Mr. Justice Lawrence said the magistrates were right, and the appeal must be dismissed. The question arose on the meaning of the words "sufficient cause" in section 305 of the Public Health Act, 1875 (38 and 39 Vic., c. 55). What was attempted to be shown as "sufficient cause" in this case was that the water-closet did not require alteration. That was not, however, a question into which the magistrates could enter when once a proper order had been made under section 36 of that Act. The magistrates might properly inquire into the regularity or irregularity of the order made by the local authority. As to whether the order was required, the magistrates had no jurisdiction. They were right in refusing evidence on that subject. Mr. Justice Channell concurred. There was no power in the magistrates to enter into the question of the sufficiency of the privy. Section 305 was the section for providing machinery under which the local authority could enter on premises for the purpose *inter alia* of making works. In this case the local authority desired to do away with the existing privy and to substitute a similar construction in its place. To understand the position it was necessary to consider section 36. Its framing clearly made the local authority the judges of the matter. The power of insisting on the substitution of one privy for another depended not on the sufficiency of the existing construction, but on the opinion of the local authority as to its sufficiency. It was not, therefore, within the functions of the magistrates to inquire into the sufficiency. In his opinion, the principle laid down in the case of "Cooper v. Wandsworth Local Board" did not apply. The real point was as to whether the justices ought to hear the evidence as to the sufficiency of the privy. In his opinion they had no such power.

At the London Auction Mart, on Tuesday, freehold ground rents, amounting in the aggregate to £4,749 per annum, secured upon a large number of private residences, dwelling-houses, shops, and other premises, including a block of modern residential flats, situate at Crouch End, Hornsey, St. John's Wood, Brixton Hill, and other suburban districts, were sold for a total of £91,120. The reversion to the rack rentals is in from 60 to 91 years, and the prices realised ranged from 29 to 31½ years' purchase.

An inquiry has been held by Mr. W. O. Meade-King at the Guildhall, Lincoln, as to an application by the City Council for the sanction of the Local Government Board to borrow £19,000 for electric-lighting purposes. It was explained that the population of Lincoln was estimated now at 48,000. The corporation in 1897 borrowed £20,650 for electric purposes, and the whole of that sum was either spent or in process of being spent. The current obtainable was equal to 5,000 8c.p. lamps, but the demand for the light already reached 6,000. The engineer, Mr. C. Vesey Brown, said the present length of cables laid was 4½ miles.

In the Queen's Bench Division, on Saturday, before Mr. Justice Bruce and Mr. Justice Ridley, judgment was given on a case stated by the arbitrator appointed to decide disputes between the Southampton Tramways Company and the Southampton Corporation as to the price at which the corporation should take over the tramways. The question to be determined was whether the company could be compelled to part with the undertaking under section 43 of the Tramways Act, 1870. If so, the arbitrator fixed the price to be paid at £51,505, and if not, at £109,963. Their lordships answered the question in the affirmative, and decided that the award held good for £51,505.

## PEARL ASSURANCE BUILDINGS, PORTSMOUTH.

This block is being erected in a prominent corner position close to the town-hall in Commercial-road, Portsmouth. Besides the company's own offices, it will comprise four shops, suites of offices on the upper floors, and a private hotel. It is being built with red brick and Portland stone to the main fronts, and the walls of the internal court are being faced with Wortley white-glazed bricks relieved with coloured bands. The dome and cupola will be covered with copper. The carving is being executed by Mr. Syd. Horsman, of London, and the fireproof staircases, &c., by Messrs. J. L. Wilkinson and Co., of Westminster. The building is being erected by Mr. J. H. Corke, of Portsmouth, from the designs of Mr. C. W. Bevis, F.R.I.B.A., of that town. Mr. A. J. Lewis is the clerk of works.

## PUGIN TRAVELLING STUDENTSHIP PRIZE DRAWINGS: MELROSE ABBEY.

The sketch shows the south transept of Melrose Abbey. It is built of a purplish red stone, with some very strong yellows, which the weather has augmented here and there with patches of green, and which give it a very fine colour effect. The whole tone of the gable is much brighter in colour than any other part of the abbey, owing principally, I think, to its southern exposure. It is supposed to have been built between 1460 and 1480, and is, perhaps, the most elaborate example of 15th-century work in Scotland. The doorway is maintained by some to be an insertion, owing to the fact that the masonry immediately surrounding it is 2in. or 3in. beyond the face of gable, and has been played to meet it. This, I think, is really a mason's error in the setting-out, an instance of which can be found in most Mediaeval buildings, and which, being usually allowed to remain, often added an unstudied charm to the structure.

J. HERVEY RUTHERFORD.

[A complete set of R.I.B.A. Silver Medal measured drawings of Melrose Abbey were published in the BUILDING NEWS for Feb. 5 and March 26, 1897. The words "West Front" in the accompanying plate are due to an error.]

"BUILDING NEWS" DESIGNING CLUB:  
A VILLAGE TAVERN.

(For description and awards see page 261.)

## VICTORIA CLUB AND INSTITUTE, SHEERNESS-ON-SEA.

The accompanying illustration shows the new assembly-hall and billiard-room for five tables, also the extension of the club premises, which is situate in The Broadway, Sheerness-on-Sea. The institution has been established for many years, and with its large and increasing number of members has outgrown its old building. The contract now in hand will more than double

the present bar accommodation, and the existing billiard-room, which is on the first floor, will be used as a reading-room in future. The large hall, when finished, will seat 600 in the body of the room, and its stage is designed for theatrical performances, with retiring-rooms and accommodation for scenery in a dock below. The great feature of this hall is its octagon-shaped roof, with arches of equal spans surmounted by a continuous girder and cornice. The floor space is rectilinear, and the span is fifty feet. To avoid the necessarily ugly outline of such a roof, if carried out to the ends, where an unmanageable sort of pediment would be presented to the street, the architect has adopted octagonal terminations, and in this way the acoustic properties of the hall are increased, while an architectural character to the interior is obtained by simple, bold, and constructional methods. The proscenium of the stage is formed by one of the before-mentioned arches, and steel ribs resting on the intervening piers form the principals of the roof, and carry the lantern, which is terminated by a lead-covered turret, inclosing an exhaust ventilator. The exterior of the work is faced with red bricks and stone, the porch and doorways being entirely of Portland stone. Messrs. Johnson and Co., of Wandsworth, are the builders of the work already in hand. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

## HOUSE, CHURCH LANE, HANDSWORTH.

This residence, for Mr. W. G. Griffith, is to be erected in Church-lane, Handsworth, in accordance with the accompanying plans. Tamar bricks are to be used externally, with Broseley tiles for the roofs, oak for the half-timbered work, and pitch-pine and red deal for the joinery work. The architect is Mr. R. S. Oldacre, of Birmingham.

## BRIDGNORTH AND SOUTH SHROPSHIRE INFIRMARY.

This building is designed to accommodate eighteen patients—viz., eight in male ward, eight in female ward, and two in private ward. All the accommodation for patients is on the ground floor; on the south of the central block is the out-patients' department, on the north is the kitchen department, with yard and detached laundry and mortuary block, while the wards are to the west, and connected to the central block by a cross-ventilated corridor; the upper story of central block is devoted to nurses and servants. The alignment of the large wards was adopted for the purpose of allowing a more even distribution of sunlight than would result from keeping them in a straight line, and also for convenience of administration. The ventilation is attained by concealed roof ventilators and by fresh-air inlets through hot-water radiators. The building generally is heated by hot-water pipes and radiators, supplemented by fireplaces in each room. The infirmary is built of bricks, all external walls being of hollow construction and faced with Ruabon bricks, the upper floor being faced with tile-hanging, with the gables of central block being of oak framing and rough-cast; and the roofs are boarded, felted, and covered with brindled Broseley tiles. The contractor was Mr. R. Merton Hughes, of Birmingham, and the laundry fittings are by Messrs. Bradford and Co., of Manchester. Mr. Edward C. H. Maidman, of 13, South Charlotte-street, Edinburgh, is the architect, whose design was selected in a limited competition confined to architects of hospital experience; Mr. Alexander Graham, Past Vice-President of the Institute of British Architects, acting as assessor.

The directors of John Oakey and Sons, Limited, propose a final dividend upon the Ordinary Shares of 5 per cent. for the half-year ending December 31 last, together with a bonus of 2½ per cent., making 12½ per cent. for the year; to pass £8,000 to reserve, making that fund £39,234 16s. 10d., and to carry £898 13s. 3d. forward to next account.

The Hon. W. F. D. Smith, M.P., is erecting an elementary school, with master's residence, and also almshouses for the village of Hambleton, Henley-on-Thames, in memory of his father, and also to commemorate the Diamond Jubilee of her Majesty.

The late Mr. H. Hicks, the well-known Peterborough builder, has left personal estate to the value of £30,000. The testator bequeaths to his wife an income of £600 a year, the surplus to accumulate until it reaches £1,600, which is then to be divided amongst his brothers and sisters, amongst whom the estate is to be divided on the death of his widow.

## ROYAL ACADEMY ARCHITECTURAL DRAWINGS, 1899.

THE days for sending in drawings and paintings this year have been fixed for March 24 and 25, the last day being Monday, the 27th. Sculpture will be received on the 28th.

Our friends and contributors who are willing to allow us to reproduce their drawings before they are sent to Burlington House, so that their works may be included in our series of illustrations from the Royal Academy Exhibition, to be published after the opening day, are invited to let us have them as soon as convenient for this purpose. We will return the drawings quickly, or, if desired, we are willing to forward them to the Academy direct, provided the necessary labels and letters to the Secretary are attached; and we will do this free of charge.

## CHIPS.

The Elgin Bridge, at Gogra, Bahramghat, was opened on Jan. 25th. It links the Bengal and North-Western Railway Trans-Gogra system with other lines, broad and narrow gauge, to the south and west. It consists of 17 spans of steel girders of 200ft. on the clear. The total cost has been £306,500. Mr. W. J. Turnbull has been the resident engineer in charge of the construction.

At the last meeting of the Council of the Royal Society of Painter-Etchers and Engravers, Mr. E. Bramley-Moore was elected an Associate.

During the exploration connected with the Roman Forum there have been discovered, near the Temple of Antoninus, some interesting fragments belonging to the Temple of Julius Cæsar.

A public recreation ground has been secured by the Peterborough Corporation for £11,000. The property had been advertised for public auction, but the corporation bought it in.

The city council of Sheffield have decided to make a start with a scheme for building houses for working men by constructing a group of twenty dwellings at Walkley.

It is proposed to rebuild the nave of the parish church of West Malling, in accordance with plans prepared by Mr. J. T. Micklethwaite, F.S.A., at an estimated cost of £4,000.

The Eastbourne Town Council have decided to purchase a picturesquely-wooded area called The Decoy, at Willingdon, for the purposes of a public park. It comprises 82 acres. In conjunction with this purchase the council resolved to construct a low-level drive from Eastbourne to Willingdon.

A new clock, striking the hours on a 16cwt. bell and the quarters on two large bells, is about to be placed in the turret of the Guildhall at Newcastle-on-Tyne. The two external dials are each 5ft. 3in. diameter, and a Grimthorpe double-legged gravity escapement will be provided. Messrs. W. Lister and Sons, of Grey-street, Newcastle, are the makers.

Very extensive alterations are being planned by the Great Eastern Railway Company in connection with Histon Station, in the Isle of Ely. Four acres of land have been purchased on the Cambridge or south side of the line, whereon will be erected new good-sheds, offices, sidings, &c. The surveyors have been at work several days, and operations will commence shortly. The accommodation for passengers will also be largely extended.

A half-length portrait of the late Mr. Henry Lee, F.R.C.S., senior consulting surgeon to St. George's Hospital, by Mr. James Sant, R.A., has been presented by his widow to the Royal College of Surgeons.

The excavating and foundations of the huge hotel on Kirkley Cliff, Lowestoft, being well advanced, the contract for the erection and completion of the building has been given to Messrs. William Johnson and Co., Limited, of Wandsworth Common, London, at about £76,000. Messrs. Isaacs and Florence, of Verulam Buildings, Gray's Inn, are the architects.

A font cover is about to be placed in the parish church of Grantham as a memorial of the Diamond Jubilee. The work will be carried out by Messrs. Rattee and Kett, wood-carvers, of Cambridge, at a cost of over £340.

The foundation stone of the new church of St. Peter, South Tottenham, was laid on Saturday afternoon. The new church, which is to be early Gothic in style, will provide accommodation for 800 persons, and will cost about £8,000. The building materials are red bricks and Weldon stone dressings.

The city council of Truro have instructed Mr. George D. Bellamy, of Plymouth, to prepare plans for the improvement and enlargement of the cattle market at a fee of 53 guineas, said fee to merge in a commission of 5 per cent. if Mr. Bellamy is intrusted with the supervision of the work.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XLI., XLIV., XLVI., XLIX., LI., LII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

C. B. GORDON. (Usually all jobs would be completed; but it is, of course, entirely a matter in the discretion of the trustee acting under the direction of the Court.)

RECEIVED.—A. N. F.—W. E. C.—M. T. and Co.—W. B. and W. S.—K. G. (Gosport).—R. F. A.

## "BUILDING NEWS" DESIGNING CLUB.

STUDENT. (It is very late in the day to criticise a design published so long since as 1896; but we are glad to know that the Club designs do get studied in this way. We spoke at the time of the failure on the part of the contributors for the particular subject mentioned to submit a really satisfactory solution of the problem. It is a common fault not to provide adequately for the support of chimney-shafts, and we are continually pointing it out.)

## Correspondence.

## OFFICIAL SUPERVISION OF BUILDINGS.

To the Editor of the BUILDING NEWS.

SIR,—I have been expecting that somebody would follow the able letter of Mr. Ellis Marsland on the subject recently discussed at the Surveyors' Institution. Mr. Weaver seems fond of trying to write smartly; but his paper is full of opinions, without arguments or facts. I have always thought that parish surveyors had plenty to do; yet Mr. Weaver seems to think that he would have plenty of time to perform his present duties, and those for many years performed by Mr. A. Fred Williams and Mr. Hart. Surely it would not benefit the public to have Mr. Weaver's clerks carrying out the Building Act in Kensington, and it is a move exactly opposite to that for which the County Council has been striving.

The object of the new system of the Council is to secure the personal attention of the gentleman appointed as district surveyor. The main point in the discussion appears to have been the proper construction of water-closets; that the district

surveyor could not stop their being constructed without a window in an external wall. Surely a simple clause in the Council's General Powers Act could alter this.

Then drains get mixed up with the Building Act. Builders are not infants fresh from the nursery; they know that they have to give notice to both district and parish surveyors for buildings and drains respectively.

Major Isaacs, who has been so fortunate as to make a large practice while acting as parish surveyor, is entirely wrong as to the value of the districts now offered. He states well under £500, whereas it is a fact that they are about £1,000. The last two filled up averaged £1,000, and several of the amalgamated districts amount to very much more.

Major Isaacs should know that many district surveyors have a good office with one or more clerks. A large staff is not required, as the office is personal. Then the office is paid for by the district surveyor: he has not spacious rooms provided in the town hall at the expense of the ratepayers.

I heard the paper read on the Dean of Guild Court, and it appeared to me that there was a great deal of fuss and red tape over a very small matter.

Coroners are independent officers: why should not district surveyors be? They have definite Acts to administer, and during all these years no fault has been found with them, and I cannot conceive how the work could be better done if the local butcher and baker had a finger in the pie. Give the new bodies greater powers, and do something to secure better men to serve on these bodies, as at present many of the members are very inferior men.

London must have a powerful central body which should control sewers, new streets, the Building Act, tramways, gas, water, and many other things.

The present system secures uniformity of practice, as the district surveyors consult and discuss vexed questions, whereas with Mr. Weaver's system we should soon have the Kensington version and the Whitechapel version with points strained for or against friends or enemies of vestrymen. Leave the system of over fifty years alone.—I am, &c.,

HENRY LOVEGROVE.

124, High-street, Shoreditch, E.

## LONDON BUILDING ACT, 1894.

SIR,—On December 17, 1897, a circular was sent to the members of the R.I.B.A. with reference to proposed amendments to the above Act. I believe nothing further has been done. The hardships and difficulties of the Act are well known to all architects, and I venture to appeal to you. If some of the leading members of the profession would take the matter up, a short Bill might be drafted to settle some of the doubtful points.—I am, &c.,

Q. R.

## BRADFORD CENTRAL FIRE BRIGADE STATION COMPETITION.

SIR,—We shall feel obliged if you will allow us to draw the attention of your readers to the most unusual manner in which this competition is being conducted. The sub-committee appointed to make a selection met last Thursday, Feb. 16th. The drawings were exhibited to the public on Feb. 17th and 18th in the Free Library, Bradford. No official notice was sent to the competitors of this exhibition. It therefore appears to us manifestly unfair and unjust that those persons chiefly interested should be kept in ignorance of what is taking place, and thus be deprived of an opportunity of examining the merits of the designs submitted.

Upon a competitor (who, by the merest chance, happened to discover this state of affairs) asking an official at the public exhibition where the three premiated designs were, he took him to the art gallery and pointed out the three selected schemes. He pointed out to the official that the first premiated design embraced three distinct schemes, and asked him which of them had been selected by the sub-committee; he thereupon replied "No single scheme has been selected, but the whole three collectively." How, we would ask, Sir, can three schemes collectively be compared with any one other scheme in a competition? There are other singular features about the actual selection made which would provoke a great deal of adverse criticism and dissatisfaction by those concerned.

The selection made has not yet been confirmed by the corporation, and we therefore suggest to other competitors that they at once combine to enter a strong protest against this method of procedure, and endeavour to prevail with the authorities to appoint the professional assessor alluded to in the conditions, a suggestion under these circumstances they will probably see the wisdom of adopting, and to hold a more extended exhibition of the drawings to enable all competitors to inspect the various designs submitted.

We shall be happy to receive the names of those who competed, and at as early a date as possible.—We are, &c.,

(Signed) FORSYTH AND MAULE.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS AND TAVISTOCK-ROAD COMPETITION, PLYMOUTH.

SIR,—Herewith I send you copy of letter I received on Saturday last from the secretary of the Royal Institute—a statement quite voluntarily made, the importance of which one cannot overestimate.—I am, &c.,

B. PRIESTLEY SHIRES, A.R.I.B.A.,  
Hon. Sec. Three Towns Branch Devon and Exeter Architectural Society.  
Central Exchange, Whimble-street, Plymouth,  
February 20, 1899.

[COPY.]

Royal Institute of British Architects,  
London, W., 17th February, 1899.

"PLYMOUTH—TAVISTOCK ROAD COMPETITION."

Dear Sir,—I am desired by the Competitions Committee to write to you with reference to Mr. Sidney Smith's, F.R.I.B.A., accepting the assessorship. Mr. Smith acted as assessor entirely without the knowledge of our Council. I wrote to him, expressing regret at his having so acted. I received a letter from him in reply, explaining the circumstance in which he went to Plymouth, and stating that he was entirely unaware—until he had made his award—of the matter having been brought to the notice of the Institute. The committee think that, in fairness both to Mr. Smith and the Council, you ought to be made acquainted with these facts.—I am, dear Sir, yours faithfully,

B. Priestley Shires, Esq.

## CHIPS.

At the Wesleyan Chapel, Halesford, near Nottingham, a new organ, built by Messrs. Alex. Young and Sons, of Manchester, at a cost of £375, was opened on Thursday in last week.

The senators of St. Andrew's University has resolved to confer the honorary degree of Doctor of Laws upon Mr. David McGibbon, architect, of Edinburgh, the author of various illustrated works on Scottish ecclesiastical and castellated architecture.

Justices Bruce and Ridley on Saturday gave judgment on a special case stated by an arbitrator. Mr. J. Nuttall, a contractor, had constructed the railway between Lynton and Barnstaple, and had executed certain works, for which he sought to be paid "extras." The arbitrator, Sir James W. Szlumper, had awarded him in all nearly £26,000, but the company contended that this was wrong in law, as the contractor, on executing the work, had not fulfilled the conditions of the agreement in writing, which was binding. The Court upheld this view, and entered judgment for the railway company, with costs.

Messrs. Chas. P. Kinnell and Co., of Southwark, as and from Jan. 1, 1899, have resolved themselves into a public limited liability company. The whole of the responsibilities of Chas. P. Kinnell and Co. have been taken over by the new company, and will be discharged by Chas. P. Kinnell and Co., Ltd. No share or debentures in the company have been allotted to the public. The business will be continued, as in the past, under the title of Chas. P. Kinnell and Co., with the necessary qualification "Limited." The alteration in the constitution of the firm has arisen through family reasons only. The responsible working partners of Chas. P. Kinnell and Co. will form the directorate of the new company, which will without doubt continue to deserve and increase the old prosperity and high reputation of the firm.

The only remaining portion of vacant land belonging to the City Corporation on the Victoria Embankment will shortly be let on a building lease by public auction. It possesses an area of 9,000 ft., with a 70 ft. frontage to the river, and is situated between the land which was recently sold to the Metropolitan Asylums Board for £53,000 and the new offices of the National Telephone Company, who pay a rental of about £2,000 a-year.

## Intercommunication.

### QUESTIONS.

[12192.]—**Sound.**—I should be glad if any of your correspondents could give me the name of a book treating of sound in connection with public halls, &c., and the rules which should govern the planning of buildings to obtain the best results from the point of view of the singer or speaker.—G. T. BASSETT.

[12193.]—**R.I.B.A. Exams.**—Would any reader kindly inform me as to what diagrams are required for the sheet of constructive masonry in the testimonies of study for the final exam of the R.I.B.A.? Also, what is the best book to obtain the necessary information from?—STUDENT.

[12194.]—**Inspection of Buildings by District Surveyor.**—After the completion of a building erected under the London Building Act, can the district surveyor inspect the building? What are the limits of his inspection? I am told it is 14 days after completion.—IN DOUBT.

[12195.]—**Estate Clerk of Works.**—What are the requirements of an estate clerk of works? Is it necessary for him to have all the training and technical accomplishments of the clerk of works engaged in large buildings? I shall be obliged for any information of the studies and books required, and what the duties are generally.—BUILDER'S PUPIL.

[12196.]—**Vagaries in Design.**—In the recent Soane Medallion designs for Concert Hall, there were a few designs of a really astounding character, violating every tradition of style; the details were crude, and shocked one's sense of architectural proportions. Will any reader versed in these extraordinary attempts of the so-called "advanced" school explain the principles upon which these designs are based?—A LEARNER.

[12197.]—**Measurement of Stone Steps.**—Will an experienced surveyor explain the best way of measuring the labour on spandrel steps of the usual kind of Portland stone? One rule given is to take the plain, sunk, or moulded work to the tread, riser, and end of step, and to take the soffit as plain. How are these surfaces to be measured?—A NOVICE.

[12198.]—**Calculating Cubic Space for Ventilation.**—I should like to be informed what space should be allowed per individual in a hall to insure good ventilation. What does an adult in each expiration give out?—authorities differ. One gives 800c in. per minute, another 1,000, another 600, and so on. The question may be put, What quantity of air does an adult require per minute? If this is known, it is easy to decide upon the dimensions of the room to give the required cubic space for individuals to be accommodated. Are there any elementary books on the subject?—A. J. K.

[12199.]—**Re Tithe-Rent Charge.**—If suburban land is taken on a long lease on a ground-rent secured by buildings erected upon it, who is liable for the tithe-rent charge, the lessor or lessee? In any case, has not the lessor to pay it according to "an Act" of 26th March, 1891, "to make better provision for the recovery of tithe-rent charge, &c.," and recharge to the lessee, if the latter is liable? No mention is made of the tithe-rent charge in the lease. Where can the total tithe charge of a parish be obtained, and is all the land in the parish equally liable, or is some land, although built upon, exempt, through being originally moorland, &c.? A little light thrown upon the subject would be esteemed.—A. BEAVER.

### REPLIES.

[12185.]—**Certificate.**—Forms of certificate vary. The following is a usual form:—"I hereby certify that, in my opinion, Mr. Brown, the contractor of ———, is entitled to receive the sum of (say) one hundred pounds, as the first instalment on account of contract dated ———."

"Contract £ ———."  
"Dated ———." (Signed) A. SMITH, Architect."  
—AN ARCHITECT.

[12185.]—**Certificate.**—Messrs. Sprague used to keep a certificate-book, but it would be easy for "Technical" to draw up a form and have it lithographed.—H. L.

[12185.]—**Certificate.**—A form of certificate sometimes used is:—"No. —. I hereby certify that ———, of ———, may be paid the sum of £ — as a, or the ———, instalment on account of ——— contract for the above."

"Contract ——— £ ———"  
"Extra works (estimated) £ ———"  
"Paid £ ———"  
"£ ——— Balance to meet this certificate."  
"(Signature) ———"  
—IGNATIEN.

[12186.]—**Quantity Surveying.**—Angles would be measured only for small pilasters or other ornamental work, not for the ordinary angles in ordinary brickwork.—SURVEYOR.

[12187.]—**Wet Granite Walls.**—Whether you have faith or not in anti-damp liquids, the fact remains that you can see in pamphlet of Carbolineum Avenarius, of Peters, Bartsch, and Co., Derby and London, a long statement by the well-known architect William White, of Wimpole-street, dated May, 1889, giving particulars of his own observations on granite rubble walls of Leusden Church, Devonshire, on highest ground in Dartmoor, and speaking highly favourably thereof. Others can be quoted from, and seen at Derby.—REGENT'S PARK.

[12187.]—**Wet Granite Walls.**—Try White's "Hygeian" Rock Building Composition. It can be applied to walls internally or externally. Cement is not always reliable. I believe this composition will be effectual if done by the directions of the manufacturer. (See advertisement.)—G. H. G.

[12188.]—**Encroachment.**—From the particulars given and sketch, I hardly know what B.'s objection is, or how A.'s cornice can encroach on his rights unless it darkens any window; but there may be some grant of

easement. If B. owns the footpath, A.'s cornice is an encroachment. No opinion is possible unless all the facts are known.—G.

[12188.]—**Encroachment.**—If A.'s cornice only abuts against B.'s wall, there cannot possibly be any encroachment, and B.'s complaint is most trivial.—H. LOVEGROVE.

[12189.]—**Society of Architects Examination.**—The subjects of examination are (1) planning and design, (2) architectural history, (3) construction, (4) materials, (5) specifications, (6) measurements and valuation, (7) contracts, (8) sanitary science. We shall be pleased to send "Phil" a detailed syllabus and any other information he may desire respecting the Society of Architects if he will write to—C. McARTHUR BUTLER, Secretary of the Society of Architects, St. James' Hall, Piccadilly, W.

[12189.]—**Society of Architects Examination.**—Particulars of the Examination of the Society of Architects are to be obtained from the Secretary of the Society, St. James' Hall, Piccadilly, W.—G. A. T. MIDDLETON.

[12189.]—**Society of Architects Examination.**—"Phil" should apply to the Secretary, St. James' Hall, Piccadilly.—H. L.

[12190.]—**Ornamental Ceilings.**—Wooden moulded ribs can be formed by moulding edges of joists, and forming the panels by ribs scribed to them between; or the ribs may be put on independently of joists, and screwed to them. Plaster slab decorations are fixed to grounds, or screwed to joists with composition screws. It is better to plaster or board the surface.—J. D.

[12191.]—**Architectural Tours.**—For some years past I have conducted Continental sketching tours at Easter and Whitsuntide, and if "A Student" will write to me at 19, Craven-street, W.C., I shall be pleased to let him know what arrangements I am making for this year.—G. A. T. MIDDLETON.

[12191.]—**Architectural Tours.**—"A Student" should himself arrange a tour in a particular district, and after making a careful itinerary he should make notes from standard works on the buildings he proposes to visit.—H. L.

## WATER SUPPLY AND SANITARY MATTERS.

LONDON WATER COMMISSION.—At the meeting of the Royal Commissioners on Monday, Mr. Frederick Tendon, chairman of the Grand Junction Water Company, gave further evidence as to the future probable requirements of his company, and said that its water compared favourably with that supplied by any other company. Mr. Wilkins, secretary to the Lambeth Company, said his company would not be willing sellers of their undertaking. He objected to the arbitration clauses suggested by the London County Council as being confiscatory in tendency, and characterised the sinking fund as most atrocious. At Tuesday's sitting, the witness gave further evidence against the Council's policy of purchase and against any special arbitration clause.

BISHOPSTEIGNTON.—The new reservoir for the better supply of water to the parish of Bishops-teignton, near Teignmouth, was opened last week. The reservoir is situated at Ash Hill, and has a capacity of 11,000 gal. The work of erecting the reservoir and laying the mains was carried out by Messrs. Best and Hawking, Teignmouth.

### CHIPS.

Nineteen gold medals in seven years is the record of the Yōt typewriter, the latest addition to this formidable list of honours being the highest award at the Industrial and Art Exhibition recently held at Grahamstown. South Africa is well to the front in recognition of the merits of the Yōt machine.

Colonel W. Langton Coke, C.E., an inspector of the Local Government Board, held an inquiry at the Manchester Town Hall on Friday into an application of the Manchester Corporation for a provisional order to enable them to put in force, with reference to lands at Carrington and Flixton, required by them for purposes of sewage disposal, the powers of the Lands Clauses Act with respect to the purchase and taking of lands otherwise than by agreement. The area in question covers some 213 acres, and it is sought to use it for sewage purposes. It was stated by opponents of the bacterial system that should it be finally adopted, the city will have to spend another £400,000 in carrying out the works.

The annual dinner of the Southampton and District Builders' and Decorators' Association was held at the Swiss Cafe Restaurant, Southampton, on Wednesday evening week, when there was a large attendance. Major Brinton, ex-president of the association, occupied the chair.

Col. A. J. Hepper, R.E., one of the inspectors of the Local Government Board, attended at the Town-hall, Ipswich, on Wednesday week, to hold an inquiry into an application by the corporation for sanction to a loan of £1,445, in order to carry out the improvement of Short-lane, St. Helen's. The town clerk, Mr. Wm. Bantoff, and the borough surveyor, Mr. E. Buckham, explained the proposals, showing that the thoroughfare will be widened from 7 ft. to 25 ft.

## Our Office Table.

THE spring exhibition at the City Art Gallery, Leeds, was opened on Monday, and is of considerable interest. Among the 266 oil-paintings hung are Watts' well-known portrait of Walter Crane; "The Wind on the Hill," by the late T. Hope McLachlan; Henry Draper's "Lament for Icarus" (lent by the Chantrey Trustees); "The Old Guards Cheer Her Majesty," by Professor Herkomer; "The Lonely Church," by A. E. Waterlow; and H. H. La Thangue's "Sussex Cider Press." Landscapes are sent by Leslie Thomson, Austin Brown, Frank Dean, and J. Aumonier, portraits by John Lavery and J. Senior, and the genre works include Edgar Bandy's interior of a meeting house, "The Word"; "Little Mischief," by Gemmell Hutchinson; and A. A. Discow's "Pied Piper of Hamelin."

MESSRS. LONGMANS, GREEN AND Co. are now issuing some admirable folios, at three shillings each, net, of reproductions from specially-taken photographs, and printed by the Swan Electric Engraving Company under the title of "Selected Examples of Decorative Art." The plates are worthy of the occasion, and have the official information taken from the labels set in type under the object represented. French and English coffers, a Spanish chestnut cabinet and stand, an Italian carved wood and gilt stucco frame, some cuir-bouilli work, glass beakers and enamelled glass bottles, bronzes from Florence, brass Flemish Mediaeval ewers in the form of lions, some Italian silver-gilt chalices, and a piece of Venetian brocade in silk and silver threads make up the subjects of the plates of the part just lately issued, and to which we may with confidence draw our readers' attention. The illustrations are to a good size, clearly defined, and well selected.

"GREATER BRADFORD" has now become a realised ambition, the Local Government Board having decided to grant the application of the corporation for the extension of the boundaries of Bradford to include the adjoining districts of Eccleshill, Idle, North Bierley, Wyke, Tong, and Thornton, bringing in an additional area of 12,007 acres, a population of 52,724, and a ratable value of £174,685. The inclusion of Shipley, Baildon, and Clayton, with 10,776 acres, a population of 37,847, and a ratable value of £141,018, is refused. By way of Tong the boundaries of Bradford and Leeds will now meet. Bradford which was incorporated in 1847, and was raised to the rank of a city in 1897, will now have an area of 22,783 acres, a population of 285,724, and a ratable value of £1,305,960.

ANENT the notes by Mr. Harry Hems last week upon West-country stocks, it may be interesting to recall the fact that in the 15th century Sir Amias Poulett—who was knighted for gallant behaviour at the battle of Newark-on-Trent, June 16, 1487, and was a predecessor of the "viscount" of erstwhile organ-grinding fame—put Cardinal Wolsey, then a village schoolmaster, into the stocks for drunkenness, which circumstance, however, the cardinal did not forget afterwards when in power. This occurred at Limington, a Somersetshire village, a mile—it may be rather more—from Ilchester. The (in modern eyes) indignity, however, does not seem to have brought any after-disgrace, as Wolsey's first preferment afterwards was the incumbency of this self-same parish, the living being presented to him by the then Marquess of Dorset. Limington is situated upon the river Yeo, from which the glove-making town of Yeovil takes its name. Its church, dedicated to St. Mary, contains a chapel with a richly-groined stone roof, as well as a sculptured effigy of Sir Richard Gyverney, the founder of the chantry. The cipher of Cardinal Wolsey, cut by him in some oakwork in the chancel, also exists. The edifice was restored in 1870, under the late Mr. Benjamin Ferrey, F.S.A., the well-known architect, by the late Mr. Davis of Langport, one of those good old-fashioned builders of sterling worth, of whom, in these days of shoddy, we very much fear so few genuine specimens remain amongst us. Lord Aldenham, writing upon the subject the other day, says: "I remember the last occupant of the stocks, at Clifton Hampden, Co. Oxon, was the village constable. He was confined there for being drunk."

"IRON FELT" is the name given to a new

insulating substance made at the Adlershof Works, near Berlin. The felt consists of long and strong woollen fibres, impregnated with a by-product of petroleum, and then coated by gelatine rendered insoluble, and also with india-rubber, afterwards vulcanised. After being subjected to considerable pressure, the iron felt assumes the form of plates measuring 2sq.ft. 22sq.in. and upwards, with a thickness varying from  $\frac{1}{8}$ in. to 2in. These plates are very elastic, being practically imperishable, while they will stand a pressure of 20,736lb. per square inch., and their surface is so hard as not to be cut by the sharp edges of bolt-heads, or of iron girders. Placed as a cushion between rails and their chairs or sleepers, underneath plunger-blocks, or between engines and their foundations, this substance is also stated to prevent vibration.

A MASSACHUSETTS builder has applied a novel remedy for the collection of debts due him. Not long ago a contractor agreed to build a wooden house on a lot in the village of Norfolk Downs. When the house was ready for plastering he applied to the owner for a payment on account. Receiving no satisfactory answer, he concluded to put a lien on the estate for his work and materials, but discovered that the property had been heavily mortgaged, and that his lien would probably bring him no return. Under these circumstances, acting, it is said, on the advice of counsel, he took a rather heroic resolution, and, making his appearance on the ground one evening, with a building mover and sixty men carrying suitable implements, he had the house lifted from its foundations and rolled away to another lot in the neighbourhood. When the other party to the contract arrived on the scene, he was, to say the least, displeased, and proceeded to enter complaint against the builder for larceny of the house, under a provision of the statutes, which applies to the purloining of real-estate the same penalties as those which attach to the stealing of personal property. The contractor and the building-mover have been notified to appear for trial, and the case promises to be an interesting one. Obviously, the important point involved is whether the house, which, although technically attached to the real-estate, had been paid for by the contractor, was the property of the owner of the lot in such a sense as would make it larceny to carry it away; and a good deal of argument can be expended on this question.

#### CHIPS.

A memorial is about to be erected at Mold to the late Daniel Owen, the Welsh novelist, and Mr. W. Goscombe John, A.R.A., has been commissioned to execute the work.

Mr. W. W. E. Fletcher, M.B., one of the Local Government Board inspectors, held an inquiry at Todmorton Town Hall on Wednesday week, for the purpose of hearing evidence as to the application of the town council to borrow £700 for the provision of a disinfectant, &c., at the Fielden Hospital.

At St. Cuthbert's Church, North-road, Durham, built some years since from Mr. E. R. Robson's designs, on Sunday last, the Barnes memorial stained-glass windows in the west end of the church were dedicated by the dean. The two windows have been executed by Mr. T. F. Curtis (Ward and Hughes), of 67, Frith-street, Soho-square, W. One is a large circular window of plate tracery, some 15ft. in diameter, with three lancets beneath it, lighting the nave. The other is a window formed of two lancets, with a sexfoil composition of plate tracery over them, situated at the west end of the south aisle.

The London County Council have considered a recommendation from the improvements committee for the widening of Mansell-street, Whitechapel, in continuation of the scheme authorised by the Act of 1897 for improving the northern approaches to the Tower Bridge. Subject to the corporation agreeing to contribute one-half the net cost of widening the whole of that portion of Mansell-street within the City boundary, the committee's recommendation that steps should be taken to commence the widening of that thoroughfare from 30ft. to 50ft. has been unanimously adopted.

Two alternate plans for the Sedgwick Memorial Museum have been submitted to the Senate of Cambridge University, of which the one providing a larger amount of accommodation than the other at an additional cost of £2,500 has been adopted. Tenders for the building will be asked for forthwith, and the long-delayed new geological museum will soon be an accomplished fact. The present Woodwardian Museum, besides being inadequate to the requirements of the department, is greatly needed as an addition to the University library.

#### MEETINGS FOR THE ENSUING WEEK.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

### Trade News.

#### WAGES MOVEMENTS.

THE PLASTERERS' DISPUTE: A LOCK-OUT DECIDED UPON.—The National Master Builders' Association resolved, on Wednesday, to declare a lock-out against the members of the Plasterers' Union on Monday week, March 6, to remain in force until the latter should guarantee the cessation of the practices to which the masters take exception as being in their judgment objectionable. The men will take, to-morrow (Saturday), a ballot, previously arranged for, to consider what action shall be taken, and the result is to be made known on Wednesday next. The Plasterers' Union has now about 3,000 members distributed over some 180 branches.

CRIEFF, N.B.—Notice has been given to the master masons of Crieff by the local secretary to the Operative Masons' Association of Scotland, that the following by-laws have been adopted for the year from June 1, 1899, to June 1, 1900:—(1) That the standard rate of wages be 9d. per hour; (2) that 2d. per hour be paid for travelling time above two miles, and 3s. per week above three miles from the Square of Crieff; (3) that the employers provide hot-plates for tea or coffee. A reply by Friday in next week, March 3, is requested.

YORKSHIRE PLASTERERS' WAGES.—The operative plasterers of Spen Valley, Dewsbury, Batley, Morley, &c., have given notice to their employers' representatives of a demand for an advance of 1d. per hour in wages, to take effect on the 1st of July. Their present rate of payment is 8d., and the hours are 49½ per week.

A Local Government Board inquiry was held at Hitchin before Col. Luard, with reference to the application from the urban district council for sanction to borrow £3,500 for the erection of a town-hall from plans by Mr. Lucas, selected in competition on the recommendation of Mr. E. W. Mountford, F.R.I.B.A., the assessor.

The vestry of St. Saviour's, Southwark, have resolved to take steps to oppose the grant of a faculty for erecting an altar-screen with niches and figures, in St. Saviour's Collegiate (Cathedral) Church. The cost of the screen is £1,900, and the statues will be private gifts. In the centre will be the Saviour in Glory, and directly underneath the Madonna with the Child. On one side will be representations of St. Swithin, Prior Aldgood, St. Olave, Bishop Giffard, W. Pont de l'Arch, Bishop Henry de Wingham, Cardinal Beaufort, St. Paulinus, St. Thomas of Cantuar, St. Peter, Bishop Fox, and kneeling angels, with the arms of the Prince of Wales and Bishop Thorold. On the other side will be St. Paul, St. Augustine, St. Justus, Gower, Archbishop Boniface, Bishop Andrews, Bishop William, Dr. Henry Sacheverell, St. Magnus, Bishop Peter de Rupibus, W. Dauncey, and kneeling angels, with arms of Bishop Talbot and the Bishop of Southwark.

Rochestown—Pair of Semi-Detached Villas ..	Guardians .....	The Company's Engineer-in-Chief, Amiens-st. Terminus, Dublin ..	" 13
Sowerby Bridge—Four-Story Warehouse at Mearlough ..	Guardians .....	Max S. Green, Engineering Inspector, Dublin Castle ..	" 13
Abergwynt—Additions to Schools (264 children) ..	Guardians .....		
Knightsdown—Valencia Island—Shore Dwellings for Light-keepers at Teraght and Skelligs Lighthouses ..	Guardians .....		
Omagh—Additions to Station ..	Guardians .....		
Maryborough—Block of Buildings and Wall at H.M.'s Prison ..	Guardians .....		

## BUILDINGS—continued.

Dublin—Electric Power House, Amiens-street .....	Gt. Northern (Ireland) Railway Co.	The Company's Engineer-in-Chief, Amiens-st. Terminus, Dublin ..	Mar. 13
Rawtenstall—Alterations to White Horse Hotel .....	John Kenyon, Ltd.	Robert Neill, Architect, 9, Grimshaw-street, Burnley ..	13
Hereford—Electricity Station, Wildmarsh-street .....	Town Council	John Parker, A.M.I.C.E., City Engineer, Hertford ..	13
Omagh—Station-master's House .....	Gt. Northern (Ireland) Railway Co.	The Company's Engineer-in-Chief, Amiens-st. Terminus, Dublin ..	13
Bela, Merioneth—County Intermediate School for Girls .....	Managers	H. Teather, Architect, 83, Wylie Cop, Shrewsbury ..	14
Bridlington Quay—Residence .....	Dr. E. Hall Batchelor	Brodrick, Lowther, & Walker, Archts, Cntrl Chmbs., Bridlington Quay ..	14
Glasgow—Exhibition Buildings, Kelvingrove Park .....	Board of Guardians	H. A. Hedley, Secretary, 141, Buchanan-street, Glasgow ..	15
Kingston-on-Thames—Female Infirmary, &c., at Workhouse .....	Asylum Committee	W. A. Hope, C.E., Architect, Portsmouth-rd., Kingston-on-Thames ..	28
Ipswich—Alterations and Additions to Borough Asylum .....	Committee of Visitors	E. Buckham, Borough Surveyor, Town Hall, Ipswich ..	April 1
Rauceby, near Sleaford—Superstructure of Lunatic Asylum .....	Thos. Cromack	G. T. Hine, F.R.I.B.A., Architect, 35, Parliament-street, S.W. ....	4
Holbeck—Ten Through Houses .....	Miss Duckworth	Fredk. W. Rhodes, Architect, Upper Wortley, Leeds ..	—
Southampton—Twenty-Nine Houses on Old Jail Site .....	W. Spong	William Burroughs Hill, F.S.I., Southampton ..	—
Southport—Laundry, &c., Meols Cop-road .....	Worthington and Co., Ltd.	F. W. Dixon, Architect, Trevelyan Buildings, Manchester ..	—
Earlsheaton—Extension of Weaving-Sheds .....	F. Mitchell	F. W. Ridgway, F.R.I.B.A., Architect, Borough Chmbs., Dewsbury ..	—
Higham Ferrers—Three Dwelling-Houses .....	Thomas Moy, Ltd.	H. Admitt, Architect, High-street, Rushden ..	—
Dewsbury—Two Shops and Houses, Halifax-road .....	Eccelesall Indus. & Prov. Soc., Ltd.	F. W. Ridgway, F.R.I.B.A., Architect, Dewsbury ..	—
Barrow-in-Furness—Queen's Arms Inn, Rawlinson-street .....	Harper Bros.	E. M. Young, Architect, 90, Duke-street, Barrow-in-Furness ..	—
Reading—Two Shops, Oxford-road .....	E. Bulley	W. Jane, 17, Market-place, Reading ..	—
Armagh—Alterations to Premises, Scotch-street .....	Industrial Co-operative Society	J. F. Gilchrist, A.I.C.E.I., M.R.I.A.I., Scotch-street, Armagh ..	—
Sheffield—Two Pairs Semi-Detached Houses, Ecclesall-road .....	Richard Leadbetter and Sons	The Princess Works, Shoreham-street, Sheffield ..	—
Colchester—Stables, &c., at The Hythe .....	R. M. English	Chas. E. Butcher, Architect, 3, Queen-street, Colchester ..	—
Morecambe—Alterations to National Schools .....	Withington Urban District Council	Marshall Bros., Architects, Back-crescent, Morecambe ..	—
Morecambe—Additions to Property, Glossop-road .....	Storry, Smithson, and Co., Ltd.	Hall and Fenton, Architects, 14, St. James's-row, Sheffield ..	—
Manningtree—Shop and House, High-street .....	Freehold Land Society	R. W. Downing, Brook-street, Manningtree ..	—
Starbeck—New Stores and Premises .....	A. McClelland	A. A. Gibson, Architect, Yorkshire Bank Chambers, Harrogate ..	—
Chudleigh Knighton—Repairs to Ten Cottages and Outbuildings at Underhayes .....	John May and Co., Ltd.	48, Wolborough-street, Newton Abbot ..	—
Walthamstow—Twelve Houses .....	John Jackson, M.S.A., Architect, Barry-street, Bradford ..	The People's Dwellings Co., Ltd., 5, Adelaide-pl., London Bridge, E.C. ..	—
Poynton—Drapery and Boot Shops, Offices, &c. ....	Urban District Council	F. W. Dixon, Architect, Trevelyan Buildings, Manchester ..	—
Kendal—141 Working Men's Dwellings, Long Fields .....	Urban District Council	Park and Johnston, Kendal ..	—
Fleetwood—Restaurant, North Albert-street .....	Urban District Council	T. A. Drummond and Sons, Architects, Fleetwood ..	—
Ballinamallard—School .....	Urban District Council	The Rectory, Ballinamallard, Ireland ..	—
Pocklington—Residence .....	Urban District Council	W. Thorp, Architect, 22A, Commercial-street, Leeds ..	—
Halstead—Additions to Industrial School .....	Urban District Council	Baker and May, Architects, Colchester ..	—
Cheshire—Sanatorium (100 beds), &c., Baguley Lodge .....	Urban District Council	J. B. Broadbent, A.R.I.B.A., 15, Cooper-street, Manchester ..	—
Skegness—Alterations, &c., to Premises, Derby-road .....	Urban District Council	Nelson Holloway, Architect, Angel-row, Nottingham ..	—
Hull—Colour Mill, Sculcoates .....	Urban District Council	Brodrick, Lowther, and Walker, Architects, 77, Lowgate, Hull ..	—
Manningtree—Shop and House, High-street .....	Urban District Council	H. Spooner, South-street, Manningtree ..	—
Bradford—Prospect Inn, Bolton-road .....	Urban District Council	John Jackson, M.S.A., Architect, Barry-street, Bradford ..	—
Higham Ferrers—Three Dwelling-Houses .....	Urban District Council	H. Admitt, Architect, High-street, Rushden ..	—
Skegness—Detached Villa .....	Urban District Council	Nelson Holloway, Architect, Angel-row, Nottingham ..	—
Caramore—Dwelling-House .....	Urban District Council	John Armstrong, Canal House, Tullamore, King's County ..	—
Todmorden—Additions to Unitarian Sunday School .....	Urban District Council	Jesse Horsfall, F.R.I.B.A., Architect, Todmorden ..	—
Belfast—Alterations to Premises, Short Strand & Anderton-st. ....	Urban District Council	W. J. Moore, Architect, Whitehall Buildings, Ann-street, Belfast ..	—
Old Colwyn—Church .....	Urban District Council	Douglas and Minshall, Architects, Chester ..	—
Hurst Brook—Methodist New Connexion Sunday School .....	Urban District Council	S. Shurt, Mount Pleasant, Ashton-under-Lyne ..	—
New Deer—Bank House .....	Urban District Council	R. G. Wilson, Architect, 181A, Union-street, Aberdeen ..	—
Swadlinote—Foundations at Gasworks .....	Urban District Council	Robert Cartwright, Commercial Manager, Gasworks, Swadlinote ..	—
Glendon—School .....	Urban District Council	Fairbank and Wall, Architects, 3, Manor-square, Otley, Yorks ..	—
Overton—Additions to Red Lion Inn .....	Urban District Council	Jas. Hartley, Architect, Bradford Chambers, Morecambe ..	—
Ecclesall—Stabling and Out-building at New Inn .....	Urban District Council	Andrew M'Neil P.P., Termon, Letterkenny ..	—
Belfast—Dwelling-houses, Brown's-square and Gardiner-street ..	Urban District Council	R. S. Wallis, Architect, Basinstoke ..	—
St. Mellon's—Three Cottages .....	Urban District Council	John Jackson, M.S.A., Architect, Barry-street, Bradford ..	—
	Urban District Council	W. J. Moore, Architect, Whitehall Buildings, Ann-street, Belfast ..	—
	Urban District Council	David Oaklands, St. Mellon's, Mon. ....	—

## ENGINEERING.

Chertsey—Rebuilding Durnford Bridge .....	Rural District Council	W. Durrant, Surveyor, Addlestone ..	Feb. 25
Bromsgrove—Girder Bridge and Urinal, &c. ....	Urban District Council	G. H. Gadd, Architect, New-road, Bromsgrove ..	25
Hovingham—Rebuilding Bridge .....	Urban District Council	Walker Stead, M.I.C.E., County Surveyor, Northallerton ..	25
Christiania—Porcelain Telegraph and Telephone Insulators (140,400) .....	Norwegian State Telegraph Administration, Christiania ..		27
Treharris—Service Reservoir (350,000 gal.), Dwelling-House, &c. ....	Merthyr Tydfil Urban Dist. Council	Thos. Fletcher Harvey, Engineer, Town Hall, Merthyr Tydfil ..	27
Crail—Filters and Clear-water Reservoir, &c. ....	Commissioners	Belfrage and Carfrae, C.E., 1, Erskine-place, Edinburgh ..	27
Edinburgh—Steam and Exhaust Pipes, Pumps, Tanks, &c. ....	Magistrates and Council	The Resident Engineer, Dewart-place, Edinburgh ..	27
Patterdale—Bridge over Griesdale Beck .....	Edinburgh and Rural District Councils	Joseph Bingley, County Surveyor, 7, Lowther-street, Kendal ..	27
Sheffield—Electric Light Plant at Workhouse, The Edge .....	Edinburgh and Rural District Councils	J. D. Webster, Architect, 19, St. James-street, Sheffield ..	27
Alnwick—Repairing Denwick Bridge .....	Edinburgh and Rural District Councils	Geoffrey Wilson, Town Surveyor, Alnwick ..	27
Burton-upon-Trent—C.I. Water-tank (6,000 gallons) at Baths. ....	Edinburgh and Rural District Councils	G. Lynam, Boro' Engineer, Town Hall, Burton-upon-Trent ..	27
Huddersfield—Mechanical Coking Stokers .....	Edinburgh and Rural District Councils	The Electricity Engineer, St. Andrew's-road, Huddersfield ..	27
Huddersfield—Switchboard .....	Edinburgh and Rural District Councils	The Electricity Engineer, St. Andrew's-road, Huddersfield ..	27
Wrexham to Rhos—Railway (3½ miles) .....	Edinburgh and Rural District Councils	The Office of the Engineer, Paddington Station, S.W. ....	28
Gloucester—Condensers, &c. ....	Edinburgh and Rural District Councils	R. Hammond, M.I.C.E., M.I.E.E., 64, Victoria-street, London, S.W. ....	28
Belfast—Steel Roof at Station .....	Edinburgh and Rural District Councils	The Company's Engineer-in-Chief, Amiens-street, Dublin ..	28
Oldham—Two Lancashire Steam Boilers (28 ft. by 8 ft.) .....	Edinburgh and Rural District Councils	Arthur Andrew, Gas and Water Offices, Oldham ..	28
Barry Dock—Locomotive Engines (10 to 20) .....	Edinburgh and Rural District Councils	W. Mein, Secretary, Barry Dock ..	28
Glenarm Harbour—Harbour Repairs .....	Edinburgh and Rural District Councils	J. H. Scaife, H.M. Quit Rent Office, 3, Lower Ormond Quay, Dublin ..	28
Llandilo, Bynae, and Pembrey—Bridges, &c. ....	Edinburgh and Rural District Councils	The Company's Engineer, Neath Station ..	28
Buxton—Rebuilding Bridge, St. John's-road .....	Edinburgh and Rural District Councils	The Surveyor to the Council, Town Hall, Buxton ..	28
Wakefield—Waterworks .....	Edinburgh and Rural District Councils	C. C. Smith, A.M.I.C.E., Waterworks Eng., Town Hall, Teignmouth ..	28
Linthwaite—Tramways (3½ miles) .....	Edinburgh and Rural District Councils	Abbey and Hanson, C.E.'s, 20, Ramsden-street, Huddersfield ..	28
Pyeongbae—Water-Mains and Covered Service Reservoir .....	Edinburgh and Rural District Councils	J. Johnston, 12, Bond-street, Brighton ..	Mar. 1
Llandilo—Storage Reservoir (6,000,000 gal.), at Nant-y-Geifr ..	Edinburgh and Rural District Councils	Arthur Davies, Town Clerk, Llandilo ..	1
Manchester—Passenger Lift at Town Hall .....	Edinburgh and Rural District Councils	J. Rison, Town Hall Steward, Manchester ..	1
London, E.C.—Bridge Work .....	Edinburgh and Rural District Councils	The Company's Office, 182, Gresham House, Old Broad-street, E.C. ....	3
Darwen—Two Twin-lute Purifiers, &c. ....	Edinburgh and Rural District Councils	A. H. Smith, Gas Engineer, Darwen ..	3
Edinburgh—Aqueduct, Bridges, &c. ....	Edinburgh and Rural District Councils	James Wilson, Engineer, 72A, George-street, Edinburgh ..	3
East Molesey—Footbridge over River Ember, Sumner-road .....	Edinburgh and Rural District Councils	John Stevenson, Surveyor, Walton-road, East Molesey ..	3
Greenock—Electric Lighting Plant .....	Edinburgh and Rural District Councils	S. E. Fedden, Municipal Buildings, Greenock ..	3
Kirkcaldy—Tramline (2 ft. gauge) along the County Highway ..	Edinburgh and Rural District Councils	Alex. Beveridge, Clerk, 220, High-street, Kirkcaldy ..	4
Road, from High-street to Thornton Junction Station .....	Edinburgh and Rural District Councils	James Barron, M.I.C.E., 1, Bon Accord-street, Aberdeen ..	4
Buckie—Bridge .....	Edinburgh and Rural District Councils	Stevenson and Burstal, Engineers, 38, Parliament-st., Westminster ..	4
Ashford—Excavating for and Laying Cast-Iron Main Pipes ..	Edinburgh and Rural District Councils	C. F. Wike, C.E., City Surveyor, Town Hall, Sheffield ..	4
Sheffield—Bridges over River Sheaf .....	Edinburgh and Rural District Councils	T. and C. Hawksley, Engineers, 30, Great George-street, S.W. ....	4
Bristol—Pumping Engines, &c. ....	Edinburgh and Rural District Councils	The Resident Engineer, Dewart-place, Edinburgh ..	5
Edinburgh—Condensing Plant, &c. ....	Edinburgh and Rural District Councils	The County Bridgemaster's Office, County Offices, Preston ..	6
Clayton-le-Dale—Stone Bridge .....	Edinburgh and Rural District Councils	Chas. A. Kent, Secretary, Trinity House, E.C. ....	9
Cornwall—Lantern for Pendern Lighthouse .....	Edinburgh and Rural District Councils	S. Meunier, Portwood, Stockport ..	9
Stockport—Dynamo (Two 140 kw) .....	Edinburgh and Rural District Councils	Chas. A. Kent, Secretary, Trinity House, E.C. ....	9
Bristol Channel—Lantern for Foreland Lighthouse .....	Edinburgh and Rural District Councils	William Smith, Architect, 65, Chancery-lane, London, W.C. ....	9
Highgate, N.—Hot-Water Arrangements at New Infirmary .....	Edinburgh and Rural District Councils	E. Radcliffe, C.E., 24, Clooney-terrace, Londonderry ..	13
Letterkenny to Camdonagh—Railway (18½ miles) .....	Edinburgh and Rural District Councils	J. Y. F. Cooke, C.E., St. Columb's, Londonderry ..	13
Bunera to Camdonagh—Railway (18½ miles) .....	Edinburgh and Rural District Councils	H. J. Weaver, C.E., Guildhall, King's Lynn ..	14
King's Lynn—Widening South Gates Bridge, London-road .....	Edinburgh and Rural District Councils	Robert Hammond, M.I.C.E., Engineer, 84, Victoria-street, S.W. ....	14
Canterbury—Plant for Electricity Works .....	Edinburgh and Rural District Councils	E. W. Waite, A.M.I.C.E., Gas and Water Offices, Barry ..	15
Biglis Moors, near Cadzow—Sinking Well, &c. ....	Edinburgh and Rural District Councils	The Manager, Gasworks, Roscommon ..	15
Roscommon—Retort Bench, &c. ....	Edinburgh and Rural District Councils	W. H. Tittensor, Dudhope Crescent-road, Dundee ..	15
Dundee—Electrical Plant at Station, Dudhope Crescent-road ..	Edinburgh and Rural District Councils	The Treasury of Pará ..	15
Belem—Waterworks .....	Edinburgh and Rural District Councils		15
Poplar, E.—Well, &c., for Supply of Water to Union Workhouse Buildings, High-street .....	Edinburgh and Rural District Councils		15
Pernambuco to Olinda—Electric Tramway (3 miles) .....	Edinburgh and Rural District Councils		15
Shanghai—Electric Trolley Tramways (28 miles) .....	Edinburgh and Rural District Councils		15

## FENCING AND WALLS.

Keswick—Wall, &c., Station-road .....	Urban District Council	William Hodgson, Surveyor, Town Hall, Keswick ..	Feb. 25
Wester Tullyfergus—Wire Fencing on Farm .....	Urban District Council	D. I. M'Walter, Wester Tullyfergus, near Aylth, Scotland ..	25
Handsworth—Vertical Hurdle Fencing and Gates (1,800 yards) and Dwarf Fencing (2,000 yards) .....	Urban District Council	E. Kenworthy, Surveyor, Council House, Handsworth ..	27
Devonport—Boundary Wall at Stoke Church Burial Ground .....	Urban District Council	John F. Burns, Borough Surveyor, 30, Ker-street, Devonport ..	27
Ilford—Iron Fencing (2,074 yards) and Entrance Gates for Public Park .....	Urban District Council	H. Shaw, A.M.I.C.E., Surveyor, 7, Cranbrook-road, Ilford ..	28
Moresby—Wall, &c., Churchyard Extension .....	Urban District Council	Rev. H. J. Allen, The Rectory, Moresby ..	28
Upper Sydenham, S.E.—W.I. Boundary Fencing and Gates, Well-road Recreation Ground .....	London County Council	The Parks Department, 9, Spring Gardens, S.W. ....	28

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2304.

FRIDAY, MARCH 3, 1899.

## PROFESSIONAL SERVICES.

THE public appreciation of the services of the architect is dictated more by a sense of their commercial worth than by other considerations. Both in private practice and in dealings with public bodies his work is undervalued, or regarded too much in the light of "showing his goods" to men able to accept or reject. The man who can turn out a number of designs on the shortest notice, who is always ready with estimates, and can obtain tenders to suit all pockets has the best chance of doing business. Praiseworthy or not, this kind of business aptitude fails to commend itself to men who have mastered their profession, and are not willing to sell their services to the lowest bidder. In the mean time the scrimmage to get commissions goes on, much to the advantage of the former class.

The attitude of the lay mind towards the art and services of the architect is a source of much heart-burning to many sensitive members of the profession. The looking at a thing from a practical or commercial standpoint has, no doubt, something to do with the matter. Another thing is, the average client and committeeman who engages an architect, or advertises for designs, take a very superficial and unjust view of the professional man. He thinks he knows all about building, as he does, or professes to do, about many other subjects—law, medicine, theology, and the rest. With a mind so preoccupied with his own ideas, so ready to pass opinions or criticise, and with entire disregard for the real facts, can it be surprising that he underrates the services rendered in preparing designs for buildings which take years to study? He orders his architect to make a design and prepare specifications, and then with a *sangfroid*, that is very provoking, changes his mind, and expects all the labour to be borne by the unfortunate designer, as if he were choosing a pattern of a grate or a wall-paper. Education, professional training, and skill appear not to enter into the considerations of people of this sort. How often we hear of a committee, about to erect a church, a school, or some other building, coolly inviting architects to send in designs without the slightest intention of selecting any of them, with the object of eliciting information, to be placed at the disposal of their own official. Even the premium is withheld, if none is selected. Only lately we heard of a case in which the clerk to a board wrote to an architect to ask him if he would kindly send him the plans of a library for their avowed guidance, as they were about to erect a similar building. Such instances are not uncommon. In another instance, one of the committee, personally a friend of an architect, offers to obtain plans without any idea of pledging himself, though privately he holds out a vague promise to his friend that he may be retained. Of course the architect acts on this promise, prepares a design, plans of which are submitted to the committee. They discuss the matter and suggest alterations. These are promptly attended to, and an amended set of plans is sent in. The committee now decide to appoint their own official, and the clerk is instructed to write to the committeeman's friend, returning his plans and thanking him for his trouble. It is needless to say this is not quite satisfactory, and a charge is made; but the committee not having given instructions officially, the architect's claim is repudiated.

These irregularities ought not to be possible in private practice; nor would they be if the profession agreed to make their own terms, or conformed to a code of rules. What would a lawyer or medical practitioner do under these circumstances? Offers of assistance or services to those from whom no direct instructions came would not be tolerated for a moment. It would be not only irregular, but contrary to professional etiquette, for a lawyer to push himself before an individual or committee and offer his professional aid.

In competitions as they are still conducted the architect gets the worst of it all round. Our Correspondence columns have been occupied of late with several grievances which could not be possible if a general code of regulations were in existence and indorsed by every member of the profession. In one case, that of the Leeds Market Hall competition, a correspondent (Mr. Sidney Smith) called attention to the unnecessary and unusual condition that *four* perspective drawings should be sent in, in addition to *pin* scale drawings. We do not object to the scale, though, the site being extensive, the drawings would be very large, and, as our correspondent says, a *pin* scale would have been big enough for the purpose. But why the *four* perspectives? In another case, a numerously-signed letter appeared in our last issue, protesting against the manner in which the competition for the Bradford Central Fire Brigade Station is being conducted. No official notice was sent to the competitors of the public exhibition of the drawings. The first premiated design, it is alleged, embraced three distinct schemes, and the reply as to which of them had been selected was that "no single scheme had been adopted, but the whole three collectively." We can hardly imagine so vague a decision has been actually made, and we hope, with our correspondent, the corporation will appoint a professional assessor to assist the committee in their selection. Of course, it is hardly fair to other competitors that a double or treble-barrelled scheme should be selected. A set of designs with alternative arrangements should only be chosen because one of them fulfils the requirements more satisfactorily than other designs; to select the two or three schemes collectively is rather an admission that the committee have not quite made up their mind as to which scheme is best—an admission also that implies their inability for the task of selection. Other designs may be found that would give more satisfactory results. In fact, there is no definite issue or selection possible under this system. We see here the absolute importance of a properly-conceived and drawn-up programme. No conditions of competition are worth anything at all unless the instructions are of a definite kind. In this connection we may call attention to the "General Code Governing Competitions in Design" that has been just adopted by the Architectural League of New York, the National Sculpture Society, and the National Society of Mural Painters. The joint committee have been engaged in formulating this code over a period of two years. Definitions are first given, and it is affirmed that "a competition may be either (A) 'Premiated,' in which remuneration is provided only for those to whom an award is made; (B) 'Paid,' in which remuneration is provided for each competitor." After defining the "promoter" as the party who undertakes responsibility for fulfilment of the competition according to its terms, &c., we come to the chief rules as to the programme, or agreement, which must be carried out in good faith by all parties. We here quote them: "The terms of the programme are to be concisely stated, and must be mandatory. The programme shall (A) Be headed substantially as follows:—Under the general code governing competitions in design of the

Architectural League of New York, of which a copy is subjoined. . . .

(Name of promoter), invites competitive proposals upon the following programme:—

(B) Contain a definite statement as to proposed cost; (C) Contain a definite provision as to anonymity; (D) Name the jury which must include experts upon the subject; (E) Fix uniform requirements for drawings, models, or other forms of proposals; (F) Fix a definite time and place for receipt of drawings, models, or forms of proposals; (G) Fix the nature or amount of the awards or prizes; (H) Fix the period of time within which decision will be rendered." Other rules relate to the requirements for drawings, models, &c., which are to be of the simplest kind, so as to reduce labour in their preparation; and to the adjudication by the vote of the jury, which include disinterested experts. It is provided under this section that if the subject requires expert knowledge, the jury may call in additional experts and the promoter to advise with them. The order of procedure of the jury is given, and the jury may decide whether the "object of the competition is to select a design, or whether it is a means of test, having for its object the selection of an artist." The last rule is important, and has not been considered as it ought to be. As we have all along contended, the assessor or judges should have the option of judging beyond the mere literal facts submitted to them in every case, to see if there is not a design which, while it fairly fulfils the requirements, is artistically arranged in other respects. To select a man well capable of doing the work is often more to be desired than to choose a design of inferior quality because the plan has been made to order, or conforms rigidly to the requirements.

## MODEL SPECIFICATIONS.—LIV.

### PAPERHANGER—DECORATOR—GASFITTER.

IN specifying the paperhanging it is usual to describe in order of value, the least costly being described before the more expensive papers. State name of manufacturer, and quote the list price; how hung, if the walls are to be lined, stopped, pumiced, or prepared; if the papers are machine papers, block damasks, chintzes, embossed flocks; if to be painted over or varnished, and how many coats. The descriptions of machine printed papers and hand-printed papers, and their prices, may be obtained of well-known makers like Messrs. Jeffrey and Co., Islington, Woollams and Co., Manchester-square, or of wholesale houses, such as Messrs. Young and Marten, Stratford, or Nicholls and Clarke, Shoreditch. The machine-printed papers range in price from 6d. per piece, or from 3d. to 5d. per yard, the hand-made papers from 2s. to 30s.; raised flock papers from 7s. per piece to 30s., or from 1s. per yard. The embossed leather papers are handsome for dining-rooms, halls, &c., and can be obtained from 4s. per yard.

We noticed a few of the more expensive relief or embossed fabrics in our last issue. As a ground for embossed paper, a lining of brown paper is recommended, and all papers should be butted at the joints, not overlapped. It is necessary to line damp walls with tinfoil, or Willesden paper, thin sheet lead, or indiarubber. The Willesden waterproof paper is recommended, and affords a better ground than the other materials.

It is a good plan to insert a clause to the effect that the papering is to be delayed for three (or six) months after completion of work if so ordered. Unless the walls are quite dry, the most expensive papers will be damaged.

In the design of wall papers special artists are employed. The main thing is that the pattern should repeat itself without any

awkward break or repetition. The design is regulated by the width of paper; thus 21in. by 21in. is the normal square or standard of width. This space may be divided into squares of different dimensions. If there are the same number of squares in depth as well as in width, the alternate pattern will not repeat correctly if the number of squares be "odd" or uneven, but this is not necessary; the depth of square may be greater. To prevent the recurrence of pattern or diaper in horizontal lines, "stepping" the design is resorted to, a plan which gives more play and freedom.

For ordinary dwellings:—

1. *Papering*.—Prepare and size walls, and supply and hang papers (approved) to all the rooms to be papered of an average price of 3s. or 5s. per piece net p.c. All papering to be cut close and truly hung. Or—

Properly stop, rub down, size with "double-size," and prepare walls and ceilings, and hang papers, to be selected at the p.c. value of 3s. (or 5s.) per piece, to rooms (state which).

2. *Bedroom Papers*.—Hang walls of bedrooms with hand (or machine-printed) papers, of the p.c. value of 2s. 6d. per piece. Or—

Hang bedroom walls with machine-printed (or sanitary papers), supplied by Jeffrey and Co. (quote price from list).

3. *Principal Rooms*.—Hang walls of drawing-room, dining-room, &c., with hand-printed papers, selected by architect, to be supplied by Jeffrey and Co. (or other well-known firm), of the p.c. value of 5s. per piece. The drawing-room to have a frieze 15in. deep, of the p.c. value of 1s. per yard.

For superior paperhanging:—

4. *Prepare Walls*.—Rub down, stop cracks, and size with double size, and prepare walls to receive paper. Or—

Strip off all old paper, stop walls where necessary.

5. *Materials*.—Provide clean fresh paste of best wheat flour and alum, and all trestle boards, &c., for the proper execution of work. The papers to be selected or approved by the architect (or the papers to be supplied by Jeffrey and Co., Islington) (or Woollams and Co.), and of the prices stated below (or quote the price according to list per piece or yard).

6. *Hanging*.—Hang the papers in the best manner, with butt joints, excepting those in attics, where the joints may be lapped. The paper to be hung true to pattern, and to be well dressed into all angles.

7. *Dining-Room*.—The walls of dining-room to be hung with hand-printed paper. A dado 3ft. high, of the p.c. value 2s. per yard, with border 4in. wide, a "filling" of the value of 3s. 6d. per piece, and a frieze 18in. deep of the p.c. value of 2s. 6d. per yard. Or—

Hang on all walls to be papered lining paper at 1s. per piece.

Hang on walls of dining-room paper of the value of 3s. 6d. per piece, the pattern to be approved by the architect.

8. *Drawing-Room*.—Hang on walls of drawing-room paper of the value of 5s. (or 18s.) per piece, with frieze 15in. or 18in. deep to match, 2s. 6d. per yard, selected by architect. Or—

The walls of drawing-room, library, and morning room to be lined with stout lining-paper, and papered with raised block paper, of the p.c. value of 18s. per piece, with frieze to match, 5s. per yard, to be selected by the architect. Or—

The walls of drawing-room, library, and morning room to be lined with stout lining-paper, lapped at joints and rubbed down, sized, and papered with satin (or hand-printed paper selected) of the p.c. value of 5s. (or 18s.) per piece. Hang frieze-paper (selected) 18in. deep of the p.c. value of 2s. 6d. per yard.

9. *Bedrooms*.—Hang walls of first-floor bedrooms with hand-printed papers, of subdued or quiet colours (or to be selected), and of the p.c. value of 3s. per piece.

The upper bedrooms to be hung with machine-printed papers of neat patterns of the p.c. value of 2s. per piece.

For old work and repairs specify: Strip off old paper, stop all cracks in Parian cement, pumice down, and paper.

10. *Bath Room, &c.*—The walls of bath-room and lavatory to have a Jeffrey and Co.'s sanitary paper (or a varnished tile-paper, selected, and to be according to list-price), or 3s. per piece.

11. *Staircase Paper*.—Prepare, stop, and rub smooth with pumicestone walls of staircase, coat same with size, and hang a dado-paper of the value

of 7s. per piece filling, and 2s. 6d. per yard for dado.

12. *Relief Paper*.—Prepare, stop, and rub down walls of staircase, and hang a "relievo" paper, p.c. 5s. per yard, with dado of the p.c. value of 3s. per yard, or specify pattern of the Anaglypta Co., Ltd., according to price-list.

13. *Relief Decoration*.—The staircase to be lined with thick brown paper, sized, and covered with "Anaglypta" (or Lincrusta-Walton), of the p.c. value 3s. per yard, the same to be painted two coats in oil-colour, picked out in tints to the satisfaction of the architect. Or—

The staircase to be lined as before, and covered with a panelled pattern of the United Asbestos Salamander decoration, selected, and of the p.c. value 1s. 6d. per yard, and with dado 21in. by 42in., p.c. 2s. 6d. per panel.

14. *Relief Wall Materials*.—The ceilings and walls of drawing-room, dining-room, hall, and staircase to be prepared for "Anaglypta" or other relief material. Renaissance or Persian design. (Name firm, quote pattern and prices.) Hang the decoration in the best manner, to be fixed to wall by a strong paste or glue. The decoration to be carefully trimmed and joined, and leave perfect.

The ceilings and walls of drawing-room, hall, or buffet to be hung with "the United Asbestos Patent Salamander Decorations," trimmed carefully and fixed with a strong paste with a small quantity of glue. The ceiling to have pattern No. 1038, strapwork design, 21in. wide, or the Old English pattern, No. 1024. The dado to be covered with pattern Louis XV., 24in. by 29in. (No. 1015), and the filling to be Louis XV., No. 1053. Or—

The walls of hall and buffet (or reception rooms) to be covered with "Lincrusta" or "Anaglypta" (describe No. of pattern from list), painted two coats of oil-colour, and picked out in tints to be chosen (or gilded) to the satisfaction of architect.

Prepare ground with first-class putty, and ground with oil-paint (or white zinc if white), finish for last coat, until a hard, smooth surface is obtained. Apply one or two coats of ripolin "mark B.L.T." Or—

Prepare ground with putty composed of ripolin of same quality and tint which will serve for finishing coat, white-lead, and turps, rub with pumice-stone in oil or water, and apply two coats of ripolin.

**NOTE.**—Instead of paperhanging, painting the walls is sometimes preferred. A valuable new material for external or internal wall-painting is "Ripolin," manufactured by Ripolin, Limited, Fenchurch-street, E.C., which combines a highly-glossy porcelain lake surface with great hardness, and resists atmospheric agencies, heat, steam, and vapours, does not crack or scale off, and can be washed. For lavatories and bathrooms, hospitals, public baths, restaurants, kitchens, &c., this enamel-like material will supersede the ordinary papering or painting.

#### GASFITTER.

In some cases this trade is better dealt with as a provision. Specify the description of pipes, whether wrought-iron tubing (if galvanised), as Russell's patent welded

tubing, with necessary bends, angles, and tees, jointed in red-lead; "composition" tubing, or block-tin tubing. These should be specified of the required sizes and weights. Great care is necessary to prevent inferior materials and dishonest workmanship in this as in the plumber's trades. (See "Laxton" for weights, &c.) Gas-tubing will weigh, for  $\frac{1}{2}$ in. diameter, 41lb. per 100ft.;  $\frac{3}{4}$ in. tubing, 60 $\frac{1}{2}$ lb.;  $\frac{1}{2}$ in., 87lb.;  $\frac{3}{4}$ in., 117lb.;  $\frac{1}{2}$ in., 179lb., and so on.

Gas-tubing should always be accessible or be in sight; and, if under floors, the boards above should have brass cups and screws, and small trap openings ought to be provided. Tubing is fixed with wall-hooks or patent clips. Provide casings to pipes (see "Carpenter"). All the tubing to be laid to certain falls to allow the condensed water to be drained off at convenient points, and for this purpose screwed plugs are provided, especially below vertical main near meter, by a T-piece. We recommend the student to peruse the treatise on "Gasfitting" by Black in Lockwood's Series. In some specifications the length of piping and fixing of different sizes and weights are given; in others the branch pipes of each size to the several positions are stated. These should first be carefully fixed, and the points marked on plan.

#### FIREPROOF BUILDINGS.

**I**N view of the fire risks in the States, the Chamber of Commerce of New York has ordered a paper by Mr. R. W. Gibson to be printed on a special feature of the fire risks of high buildings. The author assumes a type of building as a basis, one of 50ft. frontage towards a wide street 150ft. deep, and 16 stories in height, built under the New York building law for fireproof buildings. On one side is a similar fireproof structure, and on the other a six-story ordinary building, non-fireproof. There are shutterless windows on all sides. There is a common court between the adjoining fireproof building recessed into both buildings. The rear windows open on a yard. The other windows open over the roof of the combustible building. The building is insured at a premium of 16 cents on 100dol. The structure is supposed to be of brick and stone, partly filled in on a steel skeleton, floors of steel beams with terracotta arches, wood floors and exposed beams, without concrete filling up to bottom of sleepers, or any mineral wool below flooring to prevent fire entering; the soffits of beams are only covered with lin. of plaster on suitable laths, instead of in two thicknesses—one close to metal, the other furred out, with an air-space between the two. The steel or cast-iron columns are covered with 2in. of terracotta covering, but not well bonded, and pipes are admitted beneath. The partitions are of terracotta, but the doors and sashes are of wood and glass with wooden posts built in the partitions. Window sashes and frames are of wood. The stairs have iron strings and risers

## COLOUR DECORATION.\*

(Concluded from p. 261.)

IN colouring your studies from nature do not attempt more than giving the local colours, and only showing enough to express this. For the mingling and blending of colour you cannot do better than get hold of a piece of polished agate, marble, alabaster, or other richly-veined stone, note their qualities of line and colour; these studies will require great attention in the execution and, *en passant*, the employment of body colour will be found useful in making them. Then make sketches of birds, beasts, shells, and fishes which present features of decoration, and draw the same object from different points over and over again, till you have driven it into your brain and learnt something of what they have to teach. Note carefully the lines of decoration and colour and the value of contrast. Butterflies, beetles, and gorgeous insects convey a great deal of teaching, and train the eye to the beautiful harmonies and daring contrasts to be found everywhere in nature, which brings colours together in contrasts of ever-varying beauty. Any dogmatism upon the harmony of colours, and what colours may or may not be used together, is silenced when one sees how Nature employs her palette. In making these studies from nature, do not forget the need of written memoranda, descriptive of what you have before you, and figure the dimensions upon the drawing; in short, give as much information as you can find space for. Bear in mind they are studies, and not pretty drawings. You will find it useful to acquire the art of

## SKETCHING IN PERSPECTIVE.

You can in less space show so much more of your subject, and if you can readily and easily sketch in perspective, it conveys the intention much better to the lay mind. It has, besides, a commercial value, as you may convince a client the more readily if you can show him how a work will look when executed. At the same time, do not let this kind of sketching take too great a hold upon you to the neglect of careful and figured details drawn either by eye or to scale. Drawing in perspective becomes so fascinating that the temptation is to make a picture, and you will learn your lesson better by a hard matter-of-fact diagram. In making studies of ornament in monochrome, it is most useful training to do so with a brush. You cannot get anything like the freedom or effect by using pencil or pen, and you will come nearer to the Greek and the Japanese if you copy their painting direct with a brush. With a little practice you will find no great difficulty; besides, it is excellent training, and it will let you into the secret of how they produced their effects and why their ornament takes certain forms. If you wish to study the ornament as practised by the ancients Greeks, go to the British Museum, make your way to the vase-rooms, and you will see how, by the employment of simple yet lovely forms, they have produced designs in endless variety and mostly with the use of a single pigment. We frequently hear a great deal about the accuracy displayed by the Greeks in their treatment of ornament. Many of the examples which have come down to us are anything but well drawn, and all show an absence of mechanical accuracy, being obviously executed by the eye and hand only. It is the fashion in employing Greek ornament in decoration of all kinds to do so with geometrical precision, with the result that it is all "Faultily faultless, icily regular, splendidly null." It does not pulsate with life, and to employ Greek ornament thus is to miss half its beauty—which does not consist in perfect accuracy of parts, but in that charm which the trained eye and hand alone can give to all work, and which is lost in mechanical execution. In the repetition of ornament, where the same pattern is employed over and over again,

## STENCIL PLATES

are generally used, and a few remarks upon stencil plates and their use will not be out of place. The great objection to them, where the pattern to be repeated cannot be cut without leaving "ties," which are used to hold the stencil together, is that it is seldom possible to touch in these "ties" afterwards without their being apparent. The whole art of stencil-plate cutting has a rather narrow margin of limitation, and work carried

\* Abstract of a paper by COLLE ALFRED ADAMS, F.R.I.B.A., read before the London Architectural Association, Friday, Feb. 17, 1899 (see p. 264 post).

is considered the total premium of 16 cents is made up of 7½ cents on account of building's exposure, and 8½ on account of the internal risks, and the author says the results of improvements in both directions reduce the premium to 4½ cents—2 cents for exposure risks, and 2½ cents for internal risks. These particulars, summarised from the *Engineering Record*, are of interest to all concerned in buildings of this description.

## FURNITURE FROM HEAVITREE HOUSE, EXETER.

THIS week we conclude our sketches of furniture from the collection of the late Sir Clare Ford, G.C.B., for many years Ambassador at Rome, and a most enthusiastic collector. The Oak Cabinet stands 5ft. 9in. high, having carved and panelled front, with drawers and cupboards. The grand old Oak Chair is beautifully carved with open work back and quaint arms, and is of much interest. The Sideboard is also of oak, boldly carved with foliage designs, and has pillar supports with a central cupboard. The whole collection has successfully been disposed of by Mr. A. Bramley Sanders, of The Close, Exeter.

and marble treads, but exposed beneath without a ceiling of metallic lath and plaster or terracotta. The elevator shafts are open to every floor. Mr. Gibson shows the effect of partial improvements on the above maximum rate of insurance. These consist of metallic sashes, wire glass, the abolition of all wood wainscots, base-boards, wood partitions, jambs, &c., except door and partition sashes; distinct flues; fireproof doors in fireproof frames, all partitions standing in on fireproof elements of floors; sashes glazed with wire glass in fireproof frames, &c.; wood floors packed with asbestos or fire-stop solid up to top of sleepers; iron construction covered with terra-cotta or plaster or concrete including tops of beams; all floors solid fireproof, of concrete or tile, and all partitions the same, without wood studs or frames, and no glass sash or transoms; all covering to girders and columns properly bonded and anchored, and independent of pipes, &c.; stairs and elevators rendered fire-resisting, or closed to every floor, &c. The author says the result of all these improvements is to reduce the rate from 16 cents to 10½ cents on 100dols. Another set of improvements affecting the vulnerability of the building to fire originating outside is considered also, which reduces the premium to 10 cents. It

out with the extensive use of stencilling is anything but pleasing. It has a thin, starved, stiff, mechanical appearance. We may borrow a hint from the Japanese method of employing stencil-plates as practised by them at the present day. Having quoted at some length from Andrew Tuer, F.S.A., on the technique of the Japanese stencil-cutter, Mr. Cole Adams added: The Japanese employ stencil-plates for the decoration of their textile fabrics, and produce most artistic effects; whether they have any like method in use for wall or ceiling decoration I do not know, but I throw out a suggestion for adapting the principle employed by them, and applying it in a modified sense to our use. Let the design to be employed in repetition be drawn on fairly stout cartridge paper, and it may be designed without any care for the "ties," which it should be the object to dispense with, so that the plate shall leave the stencil brush finished. Then give the paper a coating each side of patent knotting, and with three or more similarly prepared blank sheets secured together at all available points, place on a sheet of plate-glass, cut out the parts through the several sheets with a sharp knife. Then when you have cut out the pattern, liberate the sheets and insert between two of them a network of very fine wire, which may be made tant by attaching it to a frame (a trifle larger than the paper stencil-plate) of stout wire. The two plates, being exactly adjusted, should then be pasted together, and when dry given another coat of knotting. It may be objected that the wire which takes the place of the "ties" will be objectionable, and will show in the colour; but with skill in manipulation it may be made, if you will, to become part of the design. It will not be any detriment, and, at all events, the plan will admit of a much wider, artistic, and more extensive use of stencilling. By having on your palette several mixings of the colour of varying tints, and two or more stencil-brushes in use, it is very easy to blend the colours of the stencilling in executing it, and to remove the harsh, mechanical appearance one so often sees. By a series of plates effects can be produced, on the same principle as wall-papers or printing in colours are done, and much of the objection to stencilling will vanish by adopting this method of the Japanese.

#### THE DIFFICULTIES THAT BESET A DECORATIVE ARTIST

are very great, and he must be ever studying so as to store his brain and keep abreast of the times. A student can hardly do better than commence his studies of decoration of the different styles with copying from the decoration of savage tribes, of which the British Museum—and most museums—contain a goodly collection. I advise this as affording illustrations of what the untutored man does in ornament and colour, and there is a marked likeness in the early efforts of different nations or tribes—lines, circles, dots, zigzags, herring-bone, and the employment of the primaries of colour. Then the styles should be taken, commencing with the Egyptian as the earliest. Let me suggest a visit to the Crystal Palace at Sydenham, where an object lesson may be learnt from the courts decorated in the different styles. Unfortunately in this country we have but few examples of ancient decorated buildings to study from, and have to be content with the fragments in our museums and the various objects to be found there. However beautiful the various fragments are, they have not the teaching that applied decoration to a building possesses; to obtain this you will have to go abroad and study the style you wish to become acquainted with in its own home, with all the surroundings which so influence the art. Much and most useful information is to be gathered from the splendid works which have been published, and which you may see at the museums and in the library of the Institute and Architectural Association. As it is hardly possible to study all the styles in the land where they have had their birth, you must study from those specimens which we possess and from books. One of the uses of possessing a knowledge of the styles is that you never know when you may be called upon to make use of this knowledge, and you should look upon it as part of your education, remembering there is no better way of familiarising yourself with them than by such study. Your sketch-book studies should include all the information you can acquire from books, and let that information be culled from the best writers on the subject; but bear in mind, a closer

and more thorough study will have to be made of those styles in which you are thinking of working.

#### WHAT IS THE BEST STYLE

to adopt for *fin de siècle* decoration? asks the bewildered student. The hum from the battle of the styles fought in the "sixties" is now at rest, and we are content to admit in the nineties whatever is the fancy of the day, until maybe, at no long future, an Architectural Association student will be found, sketch-book in hand, lost in admiration of the severe simplicity of Gower-street architecture. Yes, all is changed, and we are agreed that there is now no style in architecture which is worth dying for. For some years past men's faith in 13th-century work as the *ne plus ultra* has been rudely shaken, and the influence of a younger school of clever architects, led by Sedding, changed our faith, or, say, admitted into it greater latitude, and in the Church of the Holy Redeemer, Clerkenwell, and Holy Trinity Church, Sloane-street, we feel this force of Sedding's power, and recognise what his teaching was; that we were free to adapt from the various styles what seemed most fitting, and to cast aside the bonds of formalism, which required chapter and verse for every feature introduced into a building. Under Sedding's inspiration we feel the influence of his magic; and even though we refuse to go all the way with him, we cannot but recognise the power and that something which it is difficult to define, but which we call genius. What Sedding's status will be in the hierarchy of art we must leave to the future; with the restraint that his genius imposed, what we feel, perhaps, inclined to condemn, we are compelled to condone. It is in his followers that we have to look for results, and we have not had to wait long for them; the illustrations published in the professional journals are many of them strange and eccentric. They exhibit a likeness to the work of the master, but the spirit is wanting in them. But though these efforts may fail, are they not the outcome of the cry for freedom from the shackles of formalism? As Architecture is the mother of arts, so she must influence for good or evil her daughter Decoration. No longer will men tolerate a cold, lifeless revival of the past. Sedding's gospel of freedom is heard and felt, and what he taught finds many disciples. Who shall say that we are not to make use of ornament, no matter where we find it, if we have the wit: not a mere copying, but ideas worked out from it. Evolution is at work now as it ever was and ever will be. And what a perplexing state of things exists in our midst, and what difficulties it creates. The artist-decorator may, in the course of his practice, be called upon to decorate a church built in the Classic style, the Renaissance, the Romanesque, the Byzantine, the Mohammedan, or the Gothic; he will be required to do so in the correct style, as it is called, of the period of which the particular church is an example. Another time it will be a theatre, a concert or ballroom, or mansion, where, maybe, particular rooms are to be decorated in particular styles. Is it not, however, appalling, this demand upon the artist? No wonder if he bewails the age in which he has been born, and, from sheer weariness, closes his eyes and dreams of a time in which one style was in vogue, and one only. Surely it is wiser not to be troubled over much about what style to adopt—i.e., any of the various styles of decoration; more important surely to cultivate a good style—to study the old styles and try to absorb the principles to be found in them. Then if you elect to study any one style in particular, try to do so in the spirit in which it is conceived, and not to attempt the impossible or to revivify the past.

#### ONE OF THE PROBLEMS

in colour decoration is to employ only those colours which will look well both by daylight and artificial light. These will be influenced again by the amount of daylight which is obtainable in the place which is to be decorated. Here only experience will guide you correctly, and very difficult is it to prepare any sketch or drawing to show what you propose. Some artists positively refuse to do so, and no wonder. Still, there are clients who insist on having an idea of what the design is to be, and who will see a sketch first, and to a young artist just starting on his career, not to show what he is going to do may be fatal to his employment. Therefore, if it is insisted on, show as little colouring as possible, enough to give the general scheme, and guard yourself by saying that circumstances may compel you to alter as you go along. When the client has

approved of a scheme, the best thing that can happen for both client and artist is that the former shall go abroad for a time and not see the work through all its stages until finished. Now interiors have to be used by daylight or by artificial light, and by both day and artificial light. Under these conditions of lighting come others, and in the way in which they are met will depend largely whether the decoration is successful or otherwise. If the place is used by daylight, note what amount you have at your disposal, or will have when the windows are upholstered; what is the aspect. Then for what use the apartment is to be put, and whether it is wanted for summer or winter use. Then, again, at what time of the year you see it, so as to judge of the amount of light; if a sombre and subdued effect is sought for, or a bright and cheery one. If, again, the apartment is to be used at night, obviously your colours must be tried by artificial light, and make your experiments by that kind of light which is to be adopted. If for day and night use, you must use those colours which look well by day and night. The design thought out, you must first try the colours you are proposing to use upon the walls or ceiling. This

#### TRIAL OF COLOURS UPON THE SPOT

is of the first importance, as many are the changes that take place, and what looks well in one place looks bad in another. The experiments may be in colour only, without any design upon them, or you may, better still, put up full-size coloured cartoons *in situ*, and judge of the effect. It is a good plan to leave them up for a day or so; frequently it happens that after an interval you come upon the design with a fresh mind, and can form a better judgment than at first, and decide in what points you think they need amendment, and whether, as is very probably the case, you may omit some of the detail, strengthen and accentuate those parts which require it, and send back or bring forward others. Do not hurry over this stage of your work; it may take you hours only trying the colours and effects. When you get the colours and the design settled somewhat to your liking, you may consider yourself happy; vigilance will still be required, but the worst is over. If you have a good, intelligent, and honest foreman of painters, another great weight is taken off your shoulders. It may be that you have to collaborate with some figure or landscape artist, and then your whole scheme of colour has to be subservient to his work. And the payment for all these years of study spent upon decorative work? Your payment must be, in the first place, the delight of doing colour and design, for it is seldom you are paid adequately for the labour and time it involves. You will sometimes find clients who are under the impression that the 5 per cent. will cover your expenditure of brains and time, and be genuinely surprised when you tell them that such payment is totally inadequate. A gentleman connected with a large firm of decorators once told me that they reckoned 20 per cent. in their estimates for the "brains," and for good work requiring special skill and much time this is not excessive. Perhaps the best advice, from a purely commercial view, is to get what you honestly can, acquire a name and fame by judicious self-advertisement, strive to cultivate a manner, to become the fashion, by letting it be known far and wide by the blast of the sound of your own trumpet, that you are the artist to employ, and then Society will pay you anything in reason—and out of reason—you like to ask.

#### SOIL-PIPE VENTILATION.

AS, in accordance with the by-laws of the London County Council, traps are prohibited from being fixed at the bottom of single soil-pipes, but must be placed at the sewer end of the drain, it has become more imperative than ever that exhaust ventilators be employed on the tops of soil-pipes to maintain a constant upward current, as, should any downward current occur, a compression of the air would arise in the soil-pipe through the current coming from the drain in the opposite direction meeting it. This current might also be reversed, the air from the soil-pipe and drain passing out through the ventilating trap at the ground level.

The diagrams and description on next page explain Messrs. Robert Boyle and Son's double-action and single-action methods of soil-pipe ventilation, which have been extensively and successfully employed in this country.

# THE "BOYLE" DOUBLE AND SINGLE ACTION SYSTEMS OF SOIL PIPE VENTILATION

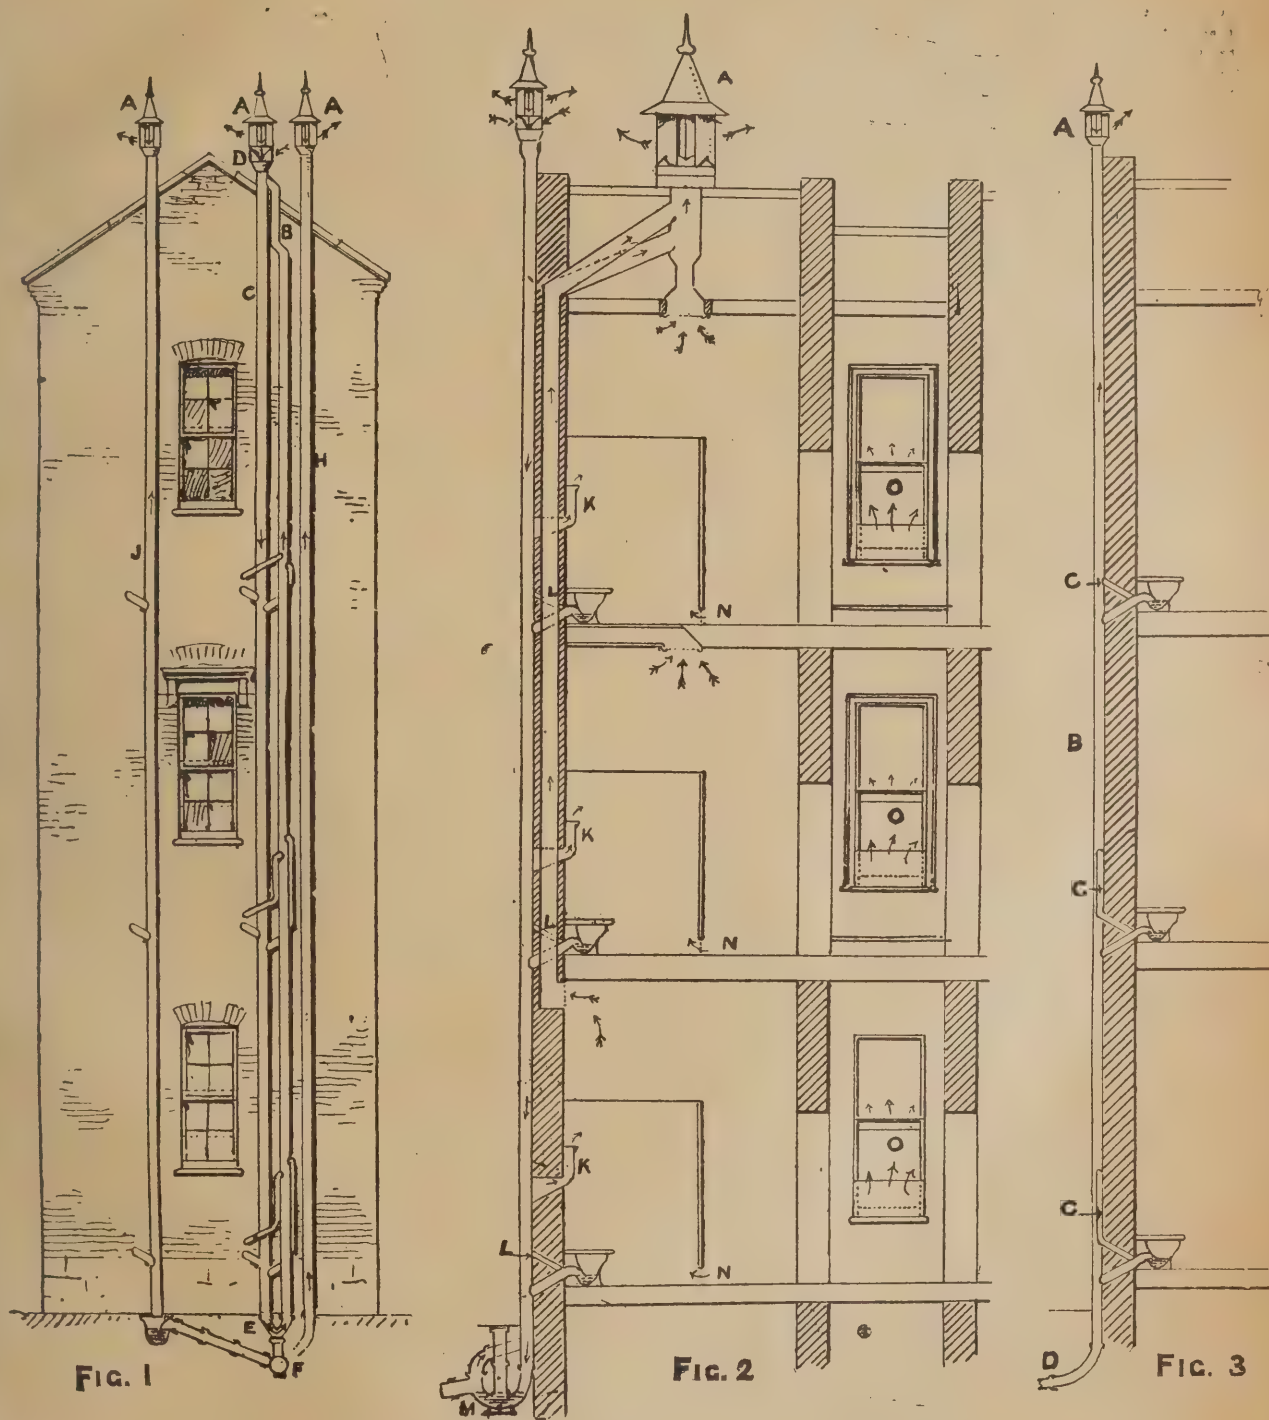

FIG. 1.—Elevation of Double-Action System. With this system a double power is obtained, the aspirating force of the "Air-Pump" Ventilator A acting upon the up-cast pipe B, and the pressure of the air down the soil-pipe C as it enters through the down-cast Ventilator D attached to the bottom of the "Air-Pump" Ventilator, and which catches the wind from every quarter, maintaining a through current at the junction E immediately above the Disconnecting-Trap F. The air inlet being above the roof, there is not the same danger from escaping noxious gases as when the inlet is at or a little above ground level. H Ventilating-Pipe connected with drain. J Waste-Pipe running into open gully connected with drain.

FIG. 2.—Section showing the ventilation of soil-pipe with the "Boyle" Double-Action System, also ventilation of W.C.'s with Boyle's Patent "Air-Pump" Ventilator A and air inlets K K. L L, 2in. pipes connected with upcast shafts for the ventilation of discharge pipes, and to prevent siphoning of traps. M, Disconnecting-Trap with inspection chamber.

FIG. 3.—Section of Single-Action System. A, Boyle's Patent "Air-Pump" Ventilator (upcast). B, Soil-Pipe. C C, Ventilating-Pipes connected with discharge pipes to prevent siphoning of traps. D, Drain-Pipes.

## "RIPOLIN."

**A**MONGST the many new decorative materials of value to architect, builder, and decorator, Ripolin deserves a high place. It is a paint ready for use, adapted for all architectural and engineering purposes, which, on drying, presents an exceedingly glossy, rich, and porcelain-like surface. It is supplied in all shades of colours, and is well adapted for external as well as internal surfaces, being applicable to metals, wood, plaster, stone, glass, &c. We have some samples of work done with Ripolin which speak for themselves. One is a white paint on plaster of Paris, which keeps its colour well, and has a highly-enamelled porcelain surface very suitable for indoor decoration, as well as a surface to reflect light in areas or courts. We have seen nothing more perfect as a white. Another slab on plaster backing is a delicate shade of salmon pink, but the surface is flat, not glossy—an excellent paint for internal wall decoration.

The other samples show the paint on wood and metal. To show its elasticity the metal can be bent double without cracking the painted surface. We have inspected the paint as applied to the offices of the Company Dominion House, 110, Fenchurch-street. The walls of one office are painted a light shade of grey flatted, with a darker shade in the dado; this has a glossy surface. The doors and architraves are also painted with Ripolin, cream or white on the framed work and mouldings with red panels. The inner room is finished with a delicate shade of pink, flat, and the dado is a green glossy surface. Other parts of the office show a number of tints of the Ripolin, all equally good and highly satisfactory. The floor of one office is also painted with this material, proving that it can be used for any surface, and is an excellent substitute for oil-painting or staining. As varnishing is not necessary where Ripolin is used, there is a distinct saving in this respect. Five different paints are made. The Ripolin "mark B.L.T." is suitable for both indoor and outdoor work, dries in 8 hours, resists the action of sun and weather, and does not scale off even under great heat. It has proved itself durable under Tropical suns. The surfaces are prepared in the usual manner with putty, and ground with oil-paint until a smooth, non-porous surface is obtained. One or two coats of ripolin B.L.T. is sufficient. The "ripolin floor-paint" is another useful sort, and is prepared for rapid setting. Ripolin "mark A" sets very quickly, in two hours, and becomes as hard as stone, and is used as an indoor paint for walls of lavatories, hospitals, prisons, &c. For fresh cement plaster Ripolin "cement paint" is used, and for painting baths, &c., another kind is made. Ripolin can be washed. It should be applied in thin coats with a firm but soft brush. For full particulars and prices, we recommend our readers to apply at one of the offices of Ripolin Limited, 110, Fenchurch-street; 8, Pembroke-square; or 175, Cromwell-road, S.W. Furniture, ironwork, girders, machines, and apparatus, ships, park-seats, carriages, &c., can be painted with Ripolin.

## THE SOCIETY OF ARCHITECTS.

**T**HE monthly meeting of the Society of Architects was held on Thursday evening in last week. Mr. E. Gard-Pye, member of council, in the chair. Four nominations for membership having been received, Mr. E. L. Clare, 61, Duke-street, Chesham, and Mr. W. A. Scott, Paradise House, Drogheda, were unanimously elected as members. Numerous donations to the library were announced by Mr. C. McArthur Butler, secretary, and were acknowledged with thanks.

## LINCRUSTA WALTON.

A paper on this subject, written by Mr. F. FORDHAM SCRUBY, was read for the author, who was present, though suffering from indisposition, by Mr. Norris. In his introductory remarks Mr. Scruby referred to the painted mural decorations of the Egyptian tombs and temples, to the veneers of richly-coloured marbles employed by the Romans, and to the use of stamped and glazed bricks by the Egyptians, Assyrians, Sassanians, and Moslems. He also referred to the hard polished stucco, of the colour of ivory, employed by both the Greeks and Romans, the secret of which was now lost. Coming down to the 16th and 17th centuries, he dealt with the decorative use in that period of stamped leather. Skins of goats and calves were,

Mr. Scruby remarked, employed; but that was a very expensive manner of decoration. These skins were pressed out with metal dies—one in relief, and the other sunk—and were also painted in various brilliant colours. Italy and Spain were the important centres of this manufacture. Before this time—in the 15th century—a wall-hanging was made of canvas to imitate tapestry. Wall papers did not come into common use until the 18th century, and then they were printed on small square pieces of hand-made paper, difficult to hang, disfigured by various joints, somewhat costly and unsightly. For these reasons a long time elapsed before wall-paper superseded such dignified decoration as carved-wood panelling, painting, tapestry, painted cloth, and stamped leather. It was very expensive, and was chosen only by those who could afford it. About the year 1857 a Mr. Frederick Walton made the discovery that linseed-oil exposed to the atmosphere oxidised. Now, that was a very simple thing to discover; but it was a very important discovery. Mr. Walton observed that a patch of linseed-oil became quite firm. While he experimented he made the discovery that he was able to produce something; but of course he did not have all his own way at the outset. By the use of what Ruskin calls the "most durable oil" he thereby gave us the linoleum of to-day, which is in itself a great achievement, and we are indebted to him for it. He thereupon founded the Staines Linoleum Company, which has paid 20 per cent. for over 20 years. One day, in 1878, whilst watching the machinery, he noticed an impression had been made on the linoleum. He saw that this indentation in the linoleum was caused by a screw which had got loose in some part of the machinery. A trifle like that no doubt some of the workmen had seen, but they had let it go by; but this little incident had struck the mind of a keen observing man, and this was the origin of Lincrusta-Walton. Through Mr. Walton's keenness, originality of thought, and determination, we are indebted for the possession of a process which enable us to beautify our homes and decorate the public buildings of the country with all the ancient designs of the most beautiful kind ever worked in leather, thus immortalising art by handing these examples down to posterity. One very great advantage in using this material, Lincrusta-Walton, is that most of the warlike insects leave it alone. Now, one of the worst we know anything about is the white ant, but he cannot fill his belly with it, so he leaves it alone; beetles and worms find nothing in it, so Lincrusta-Walton is not only beautiful, but it is enduring. It is also a positive proof against dampness. It is used in a large number of public buildings, including the Queen's Hall, Langham Hall, the Tivoli Palace of Varieties of Leeds, the Cambridge Palace of Varieties, London; the Coburg Hotel, Grosvenor-square, London; the Tivoli Palace of Varieties, Manchester; the Mosley Hotel, Manchester; the Belfast and Northern Counties Railway Hotel, Belfast; and all the chief flats and mansions in Kensington; a very large number of hotels, and most of the railway companies in the United Kingdom, as well as some of the chief liners to Australia and the United States, and the new baths at Harrogate, where there is plenty of moisture. A few of the difficulties of the manufacture of Lincrusta-Walton may be indicated. In the first instance, the material used gave considerable trouble, and though it was the same as linoleum, yet it was quite a failure. An ordinary man would have stopped there; he would, in fact, have thrown it up in disgust. Although everything seemed to point to failure, after working nearly two years Mr. Walton produced a composition of wood fibre, oxidised oil, and gum, and the result is that to-day those materials in combination are still used in the manufacture of Lincrusta-Walton. This was not his only difficulty; after having proved to his own satisfaction that this material would do, the next difficulty was the machinery. There was no machinery suitable in existence; he had, therefore, another task. He first tried the use of impressed composition for his rollers. This and other materials were experimented with; but owing to the excessively high pressure, steel rollers had to be used, which, after being used some time, were useless, and new rollers had to take their places. In addition to this £50,000 was spent before the company was ready for business, and but for the security and monopoly that a patent gives, this capital would not have been sub-

scribed at all, nor the enterprise carried out. The many fine examples of wood-carving of the 15th and 16th centuries that still exist give us some idea of the wealth of the country in this branch of art. The rich oakwork of England was no exception to the universal application of coloured decoration, and nearly every screen, roof, and choir-stall was covered with minute painting in gold and colours. The modern idea that oak should be unpainted was unknown to our Mediaeval forefathers, and they, as a rule, preferred a simple coating of paint of different colours to the natural tint of the oak. In most cases, however, the woodwork was not left with its uniform ground of paint, but delicate and graceful patterns were added on to the main lines of the work. Many of the Norfolk screens still retain much of their painted ornament in good preservation, and great richness of carving is to be seen on the church roofs of both Norfolk and Suffolk. This wood carving is usually of very high artistic merit, combining delicacy of detail with strength of decorative effect in a way that has never been surpassed by the Mediaeval artists of any country of the Continent. Norfolk, Suffolk, Devonshire, and other counties are rich in elaborate chancel-screens carved with delicate foliage. The tracery which fills in the upper part of these screens is of wonderful beauty, and executed with most minute finish. In the sixteenth and seventeenth centuries there was very little good wood-carving produced. The oak panelling and other fittings of the Elizabethan and Jacobean periods were largely enriched with surface relief, coarse in execution, but often decorative in effect. Towards the end of the 17th century a very realistic style of wood-carving came into use in which there was great technical skill but little real artistic feeling. Between the years 1648 and 1721, Grinling Gibbons and his pupils produced the most elaborate works of this class, such as wreaths, scrolls, and friezes carved in high relief, or in the round, with fruit and flowers modelled and carved with wonderful skill. These clever groups of foliage and fruit were carved in pear or lime wood, and fastened on to the surface of wall panels, mantelpieces, and other wood fittings. The stalls and screens in St. Paul's Cathedral are some of Gibbons's best works; and a great deal of his realistic carving still exists in the Oxford colleges, at Trinity College, Cambridge, at Chatsworth, Pepworth, and in many of the great country houses of that time. Since then wood-carving has not taken an important position among the lesser arts of the country. It is a matter of great gratification at the present that all these beautiful designs in wood, which have been produced by great labour and skill, are capable of being reproduced in Lincrusta-Walton, no matter how intricate or apparently difficult. Lincrusta-Walton is solid in relief, and the designs cannot be obliterated, or the artistic effect marred by workmen. In fixing Lincrusta-Walton to a new wall, time must be given sufficiently long to permit the exudation of lime to pass off by exposure to the atmosphere.

## DISCUSSION: OUTSPOKEN CRITICISMS.

Mr. J. R. MANNING, in proposing a vote of thanks to Mr. Scruby, said he must differ from the author in his advocacy of some applications of Lincrusta-Walton, such, for example, as the imitation of carved woodwork, and he certainly should object to reproducing in modern houses the beautiful oak screens to be found in Devonshire and Norfolk. That the material had a proper use all would agree; it was very effective when employed for ceiling decoration, but not for the panels of doors, for there was a want of sharpness about the material. He had, indeed, been in several houses where the doors had been spoiled in appearance by filling in the panels with Lincrusta. Another objection to it, in his mind, was that it was a sham. Mr. Scruby had stated that Lincrusta-Walton had been used in hospitals, and he should like to know which hospitals they were. For railway carriages, music-halls, and public-houses it was, he would admit, a very useful and even a valuable material, and one which afforded an excellent ground work for further decoration by painting. It required discrimination to use the material aright, and it should certainly not be utilised to represent woodwork, but ought to be restricted to its proper place as a decorative feature.

Mr. WILLIAM COOPER, of Hastings, seconded the vote of thanks, remarking that Mr. Frederick Walton was a pioneer of relief decoration as used

at the present day. His own experience in the employment of Lincruston-Walton was that it stood and matched well, and was impervious to damp. On one occasion the contractor for some of his work had put some Lincrusta-Walton on a wall before it was thoroughly dry. The result was that the plaster was drawn off the wall, but not the slightest sign of dampness was observable on the surface of the Lincrusta, and except at the joints he could perceive no mouldiness. As to the imitation of woodwork, architects would one and all wish to banish it from use; but as a commercial firm, he supposed the makers were obliged to cater to the public taste for cheap imitations.

Mr. ELLIS MARSLAND, hon. secretary, considered that while Lincrusta-Walton was confined to its legitimate purposes of decoration, nothing could be said against it. It merely resembled the leather hangings of former days, only instead of the stamping being executed on leather, it was done upon the material invented by Mr. Walton. He must, however, enter a vigorous protest against the imitation of oak-work and carving, such as they saw hung on the walls. It was taking the material out of its rightful province and making it a sham. Such imitation was very distasteful to architects, and he would urge the firm not to attempt to copy oak-work.

The CHAIRMAN agreed with Messrs. Manning, Cooper and Marsland as to the ill-effects of imitation oak panelling. There were new buildings, such as music-halls and public-houses, in which the owners were glad to have recourse to such decorations as those exhibited. He had personally had a good deal to do with the alteration of public houses and the erection of new ones, and he had employed Lincrusta-Walton with every satisfaction to his clients. It was a good wearing fabric, could be easily cleansed, and wore a long time, while it was satisfactory to be assured that insects would not attack it. In putting the vote of thanks, which was carried with applause, he coupled with the name of Mr. Scruby that of the reader of the paper, Mr. Norris.

Mr. SCRUBY said he was glad to find that a body of architects were so outspoken in their criticism of the Lincrusta panels. They all knew they were a sham, but they were much in request, and some fine specimens could be seen at the Holborn Restaurant. The general public required such a material, and the company were obliged to comply with that demand.

Mr. NORRIS also acknowledged the vote of thanks, and held that imitation was necessary, as so long ago as five thousand years the ancients had faced their walls with marble veneers, and it was rather late to attempt at the present day to put down shams. Lincrusta-Walton was admittedly an imitation; but it was far more beautiful than a veneer of marble.

#### BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE annual general meeting of the above society was held on Feb. 28. Mr. W. H. Parker, in vacating the chair of the ordinary monthly meeting of the committee, expressed regret at the unavoidable absence of the outgoing President, Mr. R. C. Foster, and introduced the incoming President, Mr. Alf. F. Randall.

Mr. Randall, who was much applauded on rising, said that the report showed the past year to have been a record one, and, whilst congratulating the committee on such a successful period, thought a fairly hard task had been set him. However, he would do his best, and hoped support would be given him "all along the line" for such a deserving cause.

The report and balance sheets as read were adopted.

The report showed an income for the year of £888 14s. 9d., the donations and subscriptions announced at the annual dinner amounting to £519 9s.; also that there were 20 recipients of the pension, two children at the orphan working school, and the committee was prepared to receive applications for a builder's clerk's orphan as an intending candidate.

In proposing the election of the incoming officers, Mr. E. Brooks reminded the committee that it was just 15 years ago the president's father occupied the same chair, and, taking his services as a criterion, they could expect good work from the son.

The Holborn Board of Guardians have decided to expend £5,000 on new drainage work for the Highgate infirmary.

## Building Intelligence.

BRADFORD.—The plans by Messrs. Mawson and Hudson, of Bradford, have been accepted for the new fire-brigade station in that city. The engine-house, to accommodate five engines, is placed in the centre of the principal front towards Nelson-street, and is 84ft. long, 35ft. wide, and 16ft. 6in. high. Immediately behind it are the stables for eight horses ready for immediate duty. The doorways to the engine-house are framed in four leaves, so that an engine can pass out at full gallop. Over the engine-house and duty room is placed the gymnasium, 45ft. 6in. by 35ft., and a dormitory or single men's quarter, 40ft. by 18ft., for the men on night duty. The workshop, 50ft. long, will be fitted with engine, lathe, drill, forge, grindstone, and work-bench. The cost of the building is estimated at £15,000.

EALING.—A theatre is being erected on the site of the old Lyric Hall in the Broadway. Entering by one of four spacious doorways is an outer vestibule, 32ft. by 21ft., on the right of which is the grand corridor, leading up to the reception lounge, which will run at the rear of the grand circle across the entire breadth of the theatre. From either side of the grand circle access is obtained to the stalls, and to the balcony or family circle access is likewise gained from the outer vestibule. A corridor direct from the Broadway will lead to the pit. The theatre is being constructed to seat 1,400 persons, and is being built without columns. The stage has a superficial area of 2,700ft. The building is to be of entirely fireproof construction, and electricity will be solely employed for illumination and stage effects. The dressing-rooms are in a self-contained block, and separated from the main building by fireproof doors. The entrances to every portion of the theatre are to be duplicated by a similar number of special exits to be used in case of emergency. The internal fittings and decorations will be ornate in character. The saucer-domed ceiling and the fronts of the grand and upper circles will be treated in the Early Greek style. Panels of Wedgwood, representing Thespian subjects, divided by small Corinthian columns, are to be introduced in the grand circle front; whilst Greek vases alternate with the upper circle panels, the figures of which, in low relief, will represent the fine arts. The proscenium frame, being square and gilded solid, will resemble a huge picture frame, and a representation of a tapestry from the well-known Baranth collection for an act drop will complete the scheme. On the eastern side of the theatre is planned a wide corridor leading direct from the Broadway to the Lyric Restaurant. At the end of this corridor reached the reception-hall, surmounted at a height of 50ft. by a glass dome and surrounded by a marble balcony on the first-floor level, and from which ascends the grand marble staircase to the principal rooms on the first and second floors. From the ground floor is entered the Montagu Rooms, the principal ball-room suite. The ball-room will have a dancing space of 65ft. by 35ft., exclusive of a permanent orchestra platform at the north end and ante-rooms on the east side; the floor will be laid on springs, and the walls are lined with fitted mirrors. The Perceval Rooms at the end of the building measure 54ft. by 20ft., and are arranged for small social gatherings. The Leopold Rooms occupy the entire Broadway frontage on the first floor, the largest room measuring 40ft. by 35ft. Adjoining this is a reception-room, 29ft. by 16ft., and the ante-rooms. French casement windows connect with an open balcony overlooking the Broadway. The Masonic Temple occupies the second floor of the Broadway frontage, which will be fitted in high wainscot oak, with its organ-chamber and domed ceiling. In addition to the suites mentioned there will be included a grill-room (30ft. by 20ft.), a café, a billiard-room, a buffet, and a reading-room. The kitchens, larders, glass and silver pantries, services, &c., will be in the central portion of the building and connect with service and wine-stock rooms on each floor, whilst the basement will contain cellarage. The building is being erected from plans by Mr. G. H. Pargeter and Mr. Walter Emden, P.S.A., who is the consulting architect for the theatre portion, and Messrs. Beer and Gash, of Wharf-road, City-road, are the contractors for the whole block. The Broadway elevation is being built in biscuit-coloured

terracotta by Messrs. Doulton, and the back elevation is treated in brickwork. The north-west corner will be capped by an open-domed turret. The building will be opened in October next.

#### CHIPS.

New schools are being erected at Littlehampton, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

Tenders are being sought by the Leeds County Council for the erection of a new police-station and branch library at the junction of Woodhouse-lane and Reservoir-street, Leeds. The new building will be set back, and will contain not only a police-office, a branch free library, and newsroom, but also an inspector's-room and a waiting-room for tramway passengers. At the junction of the two thoroughfares the building will be surmounted by a small tower, in which the Corporation will place a two-dial clock. The total cost will be about £6,000.

At the last meeting of the city council of Truro, it was stated that the arbitrator had decided that £925 was the price to be paid by the corporation for the Swan Inn, stable, outhouses, yard, and a small dwelling-house in Kenwyn-street, which it had been decided to acquire for purposes of street improvement. The town council's valuer mentioned £700, and the price given for the disposing party was £975.

At the Llandrindod Wells County-court, last week, a jury awarded the plaintiff £100 in an action for damages, brought by Richard Rickards against the firm of David Jenkins and Sons, builders, of Swansea. The plaintiff was engaged at work in connection with the building of a new hotel at Llandrindod, and in consequence, as he alleged, of defective arrangements for the safety of the workmen, he fell through a well-hole and was seriously injured.

Mr. E. A. Sandford Fawcett, an inspector of the Local Government Board, held an inquiry at the Manchester Town Hall recently into an application of the Lancashire and Yorkshire Railway Company to purchase 187 houses, to be demolished in connection with the extension of the goods-yard of the company at Oldham-road, and to provide new dwellings for the 900 residents therein. Mr. Henry Sheldermine, architect and estate agent of the Lancashire and Yorkshire Company, said the houses to be built were on a plan approved by the Local Government Board and by the corporations of Manchester and Salford. Many of the houses to be pulled down had been condemned by the sanitary authority of the city. The average rental of the new flats would be 6s. for the ground and first floors, and 5s. 6d. for the second and third floors. The company had carried out four other schemes of the same character, but on a smaller scale, in Manchester and Salford.

The engineer to the Weston-super-Mare, Clevedon, and Portishead Tramways Company has prepared the Parliamentary estimates of the cost of constructing the proposed light railway extension which are being sought this session by this company. The total length of these extensions will be six miles one furlong, and the new line will be single throughout, and will run from the termination of the company's existing tramroad at Clevedon to the siding of the Great Western Railway in Portishead. The cost of these extensions is put down at £20,258.

The Duke of York, who was accompanied by the Duchess, opened at Portsmouth on Monday four new wings, which have been added to the local hospital as a memorial of the Queen's Diamond Jubilee. Two blocks, comprising the four wards just opened, have been erected, at a cost of £15,000, from the designs of Messrs. Keith D. Young and Henry Hall, of London, the contractor being Mr. J. H. Corke, of Portsmouth. Two other blocks will be added when funds are forthcoming.

Fire broke out on Saturday afternoon in a warehouse of five floors at 9, Farringdon-road. The premises were tenanted by four firms, including Messrs. T. Hyatt and Co., manufacturers of pavement lights. The warehouse was saved from total destruction, but serious damage was caused by fire, smoke, and water to the ground floor, and the upper part of the building suffered by smoke, and the basement and its contents by water.

In the case of the application for discharge from bankruptcy of Christopher Barton, Winsford, builder and contractor, trading with Henry Barker as Barker and Barton, the discharge has been suspended for three years, ending Feb. 2, 1902. In that of Evan Bracey and Isaac Bracey, trading in co-partnership as Bracey Brothers, Staple Hill, Gloucestershire, builders, Isaac Bracey's discharge was granted conditionally; Evan Bracey did not appear, and his application was dismissed.

## PROFESSIONAL AND TRADE SOCIETIES.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—The members of this association visited on Saturday the works of Messrs. James Milne and Son, Ltd., and were received by Messrs. Milne, Lumsden, and Macfie, the managing directors, who conducted the party in sections over the works, and afterwards entertained them to luncheon. Holyrood Palace was next visited, and over it they were conducted by Mr. W. Wybrow Robertson. By special permission of Her Majesty, the private apartments were open on the occasion, and over these they were shown by Mr. Robertson and by Mr. Sands, of the Lord Chamberlain's department.

**"INFLUENCE OF ATMOSPHERE ON BUILDINGS AND DECORATIONS."**—At a meeting of the architectural section of the Philosophical Society of Glasgow on Monday night, Mr. P. Macgregor Chalmers presiding, a paper was read by Mr. Oscar Paterson, glass stainer, on the subject of "Atmospheric Influence on Architecture and Decorations." The paper was illustrated by chemical demonstration and a large number of lantern-slides. The lecturer pointed out that the very offensive and noxious condition of the atmosphere of Glasgow was the resultant of the free escape of factory smoke and the subsequent oxidation of the sulphur in the coal into sulphuric acid. The immediate result of the dissemination of this corrosive and virulent compound was observed in the erosion of the stone of the public buildings in the city, and the destruction of vegetation, while the free molecules of carbon carried over in the soot of factory smoke settled on stonework, turned the natural brightness of the material into a gloomy and sombre grey, destroying at once the precision, fineness, and quality of the architecture. Mr. Paterson dwelt on the condition of the statuary in Glasgow's public squares, and, while deploring the offensive condition of its surface, where all the intrinsic quality of the material was entirely destroyed by the coating of oxy-sulphides and other impurities which had formed or been deposited there, he suggested a mode of treatment based on experiments adopted by the municipality of Berlin. The stonework of the Municipal Chambers of the city was beginning to succumb to the effects of the atmosphere. Referring to the action of the atmosphere on decoration, the lecturer pointed out that sulphuric acid and hydric sulphide were the principal factors in the change of colour that takes place in certain decorations. It was also suggested that by a due attention to an efficient medium and method of painting the most fugitive colours almost could be rendered permanent. Glasgow ranked next to London itself in the impurity of its atmosphere, and however high a position the city might have acquired as an art centre, there was probably no other town in the kingdom where public buildings and decorations had so uncertain a condition of stability.

The rural district council of Billericay have requested Mr. G. Maxwell Lawford, M.Inst.C.E. (Messrs. Bailey-Denton, Son, and Lawford), of Palace Chambers, Westminster, to report to them upon a scheme of sewerage and sewage disposal for the growing town of Billericay, which is being largely developed owing to the Great Eastern line to Southend, which runs through it.

Colonel Sir Francis Marindin, R.E., on behalf of the Board of Trade, inspected last week the tram-lines which have been recently laid by the Moss Side urban district council, under the supervision of Mr. W. R. Acton, the engineer of the scheme. The route taken was from Brooks's Bar, *via* Raby-street and Moss-lane East, to Wilmslow-road; thence along Upper Lloyd-street and Monton-street, *via* Burlington-street, to Greenheys-lane and Denmark-road, and along the Princess-road and Bradshaw-street sections. The whole of the lines received the approval of the inspector, and he sanctioned their immediate use.

The Bishop of Oxford dedicated, on Sunday week, a chancel-screen in St. Mary's Church, Mortimer, Berks, erected as a memorial of the late Mr. Richard Benyon, and designed by Sir Arthur W. Blomfield, A.R.A. The screen is of English oak, surmounted by a border of tracery, from the centre of which rises a cross.

The new Welsh Congregational chapel to be erected in Trinity-road, Bootle, has been intrusted to Mr. T. Taliesin Rees, A.R.I.B.A., Birkenhead. The design was selected from a number sent in a limited competition. The building will be erected in red brick and terracotta.

## COMPETITIONS.

**TOTTENHAM.**—The urban district council have received competitive schemes for the erection of a dust destructor as follows:—"Algebra," £22,976; "Smokeless," £16,200; "Intensifier," £12,355. The premiums offered were £25, £15, and £10 only. The plans have been referred to a committee.

**NELSON, LANCS.**—At a special meeting of the building committee of St. Philip's Church, Nelson, plans of a new church which it is proposed to erect in place of the present iron buildings were submitted. The successful competitor was Mr. Preston, of Manchester. The cost of the new church is estimated at £5,000.

## CHIPS.

The town council of Ayr, after a protracted discussion, have decided to purchase as a site for the new town hall a site in Sandgate Park, measuring 135ft. by 200ft., for £4,200.

After seven months' consideration the electric lighting committee of the Hackney Vestry have issued a report prepared by Mr. R. Hammond, and the committee recommend the vestry to adopt an electric-lighting scheme therein set out, which will cost, exclusive of charges for the site of the works, £242,367.

The new intermediate schools, Builth, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The death is announced of Mr. William Todd, architect, of Abbey-road, St. John's Wood. The deceased was one of the senior members of the London Architectural Association, his membership dating from 1871.

At a general meeting of the Royal Institute of Painters in Water-Colours, Piccadilly, held on Tuesday evening, Messrs. Alexander McBride and Edward C. Clifford were elected members.

Lieutenant-Colonel Frederic Bailey, R.E., Edinburgh, held an inquiry within the Municipal Buildings, Bo'ness, N.B., on Monday, with regard to an improvement scheme which the town council of the burgh as local authority propose to carry out under the Housing of the Working Classes Act, 1890, from plans by Mr. J. P. Laurie, the burgh surveyor. The area to be dealt with extends to about one acre, and is situated between North-street and South-street West from the post-office and market-square. On this are situated about 100 dwelling-houses, 12 shops, and two public-houses, valued at £6,300. Nearly all this property is in a ruinous condition, huddled together with very little light and air-space, and in a very bad state from a sanitary point of view.

The town council of Devonport adopted, on Monday, a scheme by Mr. James Diggle, C.E., of Manchester, for dealing with the drainage of the St. Badaux and Camel's Head districts. The estimated cost of the undertaking is £36,409.

A destructive fire occurred on Monday morning in the timber-yard of Messrs. Garland and Roger, Dumfries. The fire broke out in a small store, erected of timber, and occupied by a grocer, and from there it spread to the stacks of timber in the yard, some thirty of which were burnt out. The loss is estimated at £5,000.

The alterations in converting the premises for the National Provincial Bank of England, Hove, into a branch bank have been done by Messrs. Pells Bros., architects, 185, Church-road, Hove. The work generally has been carried out by Messrs. Parsons and Sons, contractors, Hove.

Sir Hugh Owen, G.C.B., the late permanent Secretary to the Local Government Board, was presented on Friday with the freedom of the Plumbers' Company, which carries with it the freedom of the City. Mr. Alderman Hinde, the Master of the company, presented Sir Hugh with the freedom inscribed on vellum. Mr. Chaplin (president of the Local Government Board), the Lord Mayor, and Mr. T. McKinnon Wood all spoke of the value of Sir Hugh's service, who, in reply, paid a tribute of praise to the local authorities for their efforts in the direction of the saving of human life by better sanitary administration.

Col. A. G. Durnford, R.E., Local Government Board Inspector, attended at the town-hall, South Shields, on Friday, for the purpose of inquiring into the application by the corporation for powers to borrow £20,000 for electric lighting purposes, and £17,250 for purposes of public walks and pleasure grounds.

A new elementary school erected in George-street by the Dumfries School Board was opened on Monday. It has cost (with the site) nearly £10,000, and provides accommodation for 500 pupils. The architect is Mr. Crombie, of Dumfries.

## PARLIAMENTARY NOTES.

**METROPOLIS MANAGEMENT ACTS AMENDMENT (BY-LAWS) BILL.**—Lord Monckswell, in moving the second reading of this measure on Monday in the House of Lords, said that the Bill was one to enable the London County Council to make by-laws "requiring persons about to construct, reconstruct, or alter drains in connection with buildings to deposit with the sanitary authority of the district such plans, sections, and particulars as may be necessary for the purpose of ascertaining whether such construction, reconstruction, or alteration is in accordance with the statutory provisions relative thereto, and with any by-laws made under the said sections." The Bill passed its second reading in their lordships' House last year, but in the Standing Committee an amendment was made at the instance of the Prime Minister, and a further amendment was introduced on behalf of the Government. By inadvertence he had the Bill printed in the form in which it was introduced last year. He undertook on the third reading to make the measure precisely as it passed through Committee last Session, and under such circumstances their lordships might not think it necessary to send the Bill to the Standing Committee. The Lord Chancellor remarked that he was jealous of plans being put before the London County Council. Only recently a case came under his notice in which a very slight alteration was to be made, and yet the cost of the work was run up to £450. Lord Monckswell said it was not proposed that the plans should be put before the County Council, but before the local authorities, and he imagined that the latter bodies would show discrimination in enforcing the by-law. The Bill was then read a second time.—On going into Committee on the Bill on Tuesday, the Earl of Morley complained that one of the provisions of the Bill was that a plan of the simplest alteration of the drain, or part of a drain, must be submitted to the local authority. It would thus be seen that the provision might operate very oppressively. He thought the Bill should go before the Standing Committee, where it would be examined a little more minutely than it would in the House itself. Lord Monckswell pointed out that the previous day he had undertaken to introduce amendments in committee which would put the Bill in the position in which it left the Standing Committee last year. Under such circumstances he did not think it necessary to send the Bill to the Standing Committee. The House went into committee, and Lord Monckswell moved an amendment, adopted in the Standing Committee last Session, to the effect that persons about to construct, reconstruct, or alter drains in connection with buildings should not be required to deposit plans, sections, and particulars of the work with the sanitary authority in cases of emergency. The amendment was agreed to, and the Bill passed through committee.

**THE NEW PARLIAMENT-STREET.**—In reply to Mr. Gladstone (Leeds, W.), Mr. Akers Douglas (Kent, St. Augustine's) said the width of the new Parliament-street between the buildings will be about 140ft., and the width between the kerbs about 95ft. The front of the new buildings will be set back from 10ft. to 15ft. from the corner of the Home Office. The approximate height of the new public offices will be 78ft., the tower at the south-east angle being about 106ft. The arrangement of the refuges will follow those already in existence in Parliament-street, which have been found most convenient for traffic purposes. The width of the new Charles-street will be 80ft.

**THE STRAND-HOLBORN AND HOLYWELL-STREET IMPROVEMENTS.**—In the House of Commons, on Tuesday, a discussion occurred on the order for the second reading of the London Improvements Bill. Sir H. Fowler moved, but subsequently withdrew, a motion for the rejection of the Bill, his contention being that the construction of the new street between Holborn and the Strand, which was sanctioned by the measure, ought not to be proceeded with before the demolition of the houses between the Strand and Holywell-street had been effected. The Strand improvement, he maintained, ought not to be deferred. Mr. Stuart explained that the London County Council hoped to save a considerable sum of money if priority was obtained for the scheme which this Bill sanctioned, and after remarks from Mr. R. G. Webster, Mr. Burns, and Mr. J. W. Lowther, who hoped the progress of the measure would not be impeded, the second reading was agreed to.

Sir Edward Green, Bart., heads with £1,000 a list of subscriptions amounting to £8,000, in response to an appeal by the Dean of York for £50,000 for the further repair of the Minster, recommended by Mr. G. F. Bodley, A.R.A., in his report as architect to the Dean and Chapter.

The Department of Greek and Roman Antiquities in the British Museum has recently obtained a number of relics of various kinds, including many small panels painted in encaustic for the decoration of a villa at Boscoreale.

NATIONAL BRONZE MEDAL DESIGN FOR A COUNTRY HOUSE.  
—THE "SCOTSMAN" BUILDING, EDINBURGH.—ORIGINAL DRAWING BY GRINLING GIBBONS OF DR. HOLDER'S MONUMENT IN ST. PAUL'S.—GROTESQUES IN BEVERLEY MINSTER.—A GROUP OF FIVE WORKMEN'S COTTAGES AT PORT SUNLIGHT.—NEW CEMETERY CHAPELS AND CREMATORIUM, NOTTINGHAM.—FRAGMENTS OF SIXTEENTH-CENTURY WOODWORK.

## Our Illustrations.

## BRONZE MEDAL DESIGN FOR COUNTRY HOUSE.

These drawings were prepared last winter at the Nottingham School of Art by Mr. Harry H. Goodall. Materials would be red sand-bricks for walls, strings, sills, &c., and red tiles on roofs. The exterior woodwork generally would be painted white, and leaded lights fixed to all windows. All the principal rooms on ground floor open out of a roomy hall, in which the staircase is situated, and the kitchen and offices are separated from this part of the house by a ventilated passage.

## THE "SCOTSMAN" BUILDING, EDINBURGH.

The architects of this building, which is the office of the well-known Scottish newspaper, are Messrs. Denne and Findlay, of Edinburgh. Some accident has delayed the detailed description, which shall appear next week.

## ORIGINAL DRAWING BY GRINLING GIBBONS OF MONUMENT IN ST. PAUL'S CATHEDRAL.

SIR CHARLES ROBINSON has kindly lent us this very interesting drawing, which Grinling Gibbons made for a monument he executed to the memory of Dr. Holder, who married Susanna, the sister of Sir Christopher Wren, the architect. We have also been favoured by the loan of the original contract, of which we give a copy *in extenso*. It will be seen that the sculptor undertook to carry out the work to the satisfaction of Wren for the sum of eighty pounds. The design is enriched with festoons and a mantling elevated by two winged figures, over which arrangement in the centre is an heraldic shield. The inscriptions are on two fields divided by a ribbon. The legend on the first table runs:

H. S. E.

Gulielmus Holder, S.J.P. Sacelli Regalis Subdecanus Serenif Regie Majestati Sublecominarius Ecclesie Sti Pauli, &c. Eliens Canonicus. Societatis Regie Lond. Sodalis, &c. Amplius quidem Titulis donatus amplissimis dignus Vir per elegantis, &c., ameni ingenii Scientias Industriam suam Illustravit liberalitate promovit, Egregie Eruditus Theologicis, Mathematicis, &c. Arte Musica, Memoriam Ecclesie Posteris, &c., a Lucubrationibus suis editis Loquelae Principia agnoscite, &c. Harmonice Obiit 24 Jan., 1697. 82.

On the second table these words are carved:

Susanna Holder, late wife of William Holder, D.D., Residentiary of this Church, Daughter of Dr. Christopher Wren, late Dean of Winsor, and sister of Sir Christopher Wren, Kt.

Among other, her excellent Endowments of Prudence, Virtue, and Piety. Her charities were no small blessing to the neighbourhood where ver she resided, having in comparison to the poor applied herself to the knowledge of Medicinal Remedies, wherein God gave so great a blessing, that thousands were happily healed by her, and no one ever miscarried. K. Charles II., 2 Catherine, and very many of the Court had also experience of her successful hand. After 45 years happily and honourably passed in conjugal state and cares, at the age of 61 she

piously rendered her soul to God the last day of June, Anno Dom 1698.

The arms of Holder: sable a chevron between three anchors argent, impaled with her paternal coat—viz., argent a chevron, three lions' heads, erased sable, on a chief gules, three cross crosslets or.

[COPY.]

Articles of Agreement made and concluded this fifteenth day of January, in the year of Our Lord 1698-7, between Dr. William Holder, residentiary of the Cathedral Church of St. Paul's, London, of the one part, and Grinling Gibbons, statuary, of the parish of St. Paul's, Covent Garden, of the other part. And the said Grinling Gibbons, his executors and assigns, for and in consideration of the summe of twenty pounds to him in hand paid at the sealing and delivery hereof, the receipt of which he doth by these presents acknowledge; and the further summe to be hereafter paid as in these articles is hereunder expressed doth covenant and agree with the said Dr. Holder his executors administrators and assigns to make a monument of white marble of one entire stone, excepting the Coate of Arms, which is also of one other stone of marble according to a designe approved and signed by the said Dr. Holder, and of such dimensions as expressed by the scale of the said designe to which these articles particularly referre, and to put in and engrave of sufficient depth all the letters of two such inscriptions or epitaphs as may well be contained in the tables of the same in letters of about halfe an inch, in such manner and after such copy as shall be delivered him by the said Dr. Holder, his executors or assigns. And the said Gibbons doth further agree the said monument shall be made of good white statue marble and wrought and carved workmanlike, according to the best of his skill and judgement, and firmly fixed and set-up at his own charge in the place appointed, or that shall be appointed, by Sir Christopher Wren, his successors, or assigns in the vaults under the quire of the cathedral church of St. Pauls, at or before the fifteenth day of May next ensuing the date hereof. And, if any difference arise concerning the well performance of the aforesaid work according to these articles, the said Grinling Gibbons doth referre and submit himself to the approbation and final determination of Sir Christopher Wren, surveyor of the workes of St. Pauls, or the surveyor for the workes for the time being. And the aforesaid worke being finished, set up, and approved according to the true intent and meaning of these articles, the said Dr. Holder doth for himselfe, his executors, administrators, and assigns, covenant and agree to pay to the said Grinling Gibbons the further summe of sixty pound. In witness whereof we have hereunto interchangably set our hand and seals the day and yeare above written.

(Signed) GRINLING GIBBONS (Seal).

Signed, sealed, and delivered in the presence of  
THOS. HADO.  
WILLIAM DICKINSON.

## PUGIN TRAVELLING STUDENTSHIP PRIZE DRAWINGS: GROTESQUES FROM BEVERLEY MINSTER.

This sheet of spirited sketches is by Mr. Harvey Rutherford, and it belongs to the series for which the Pugin Travelling Studentship was awarded him this year. The carvings shown in the upper part of the plate are from the arcading in the south aisle of the nave, and the lower drawing of the lion and the dragon was made from the Percy tomb in the choir of this famous and beautiful church.

## WORKMEN'S COTTAGES, PORT SUNLIGHT.

The housing question, now so prominently before the public, imparts a special interest to projects such as that realised at Port Sunlight, Cheshire, where the proprietors, Messrs. Lever Bros., have built one of the most picturesque villages to be found anywhere, and in many ways it is unique. We have already illustrated the schools and village shop, as well as some of the dwellings designed by leading architects. The examples we have given are by Messrs. Ernest George and Yeats, Messrs. Douglas and Fordham, Messrs. Grayson and Ould, Messrs. Lockwood and Sons, and Mr. Ernest Newton. The group of five cottages published to-day takes its place in the same colony. The walling of these houses is executed in Ruabon red thin bricks, tile hanging, rough-cast and timber work being sparingly used. The roofs are covered with Ruabon tiles. The whole effect depends upon picturesque outline and a broad treatment of the parts, rigid economy being essential. This group forms one of the blocks designed for Messrs. Lever by Mr. Maurice B. Adams, F.R.I.B.A., architect.

## SELECTED DESIGNS, NEW CEMETERY CHAPELS AND CREMATORIUM, NOTTINGHAM.

THE Corporation of Nottingham held a competition recently, and Mr. Aston Webb, F.S.A., acted as assessor, when he selected the design now illustrated, the authors being Messrs. Arthur E. McKewan and Alfred J. Dunn, A.A.R.I.B.A., joint architects. The group consists of two chapels, one for the Church of England and one for the use of the Nonconformists. Each have waiting-rooms and vestries. In the centre is located a crematorium chapel, the furnace to same being placed to the rear. The cloister,

extending along the façade and binding the three chapels into one composition, is planned with niches to take a series of urns containing the ashes of cremated persons. Mansfield stone is intended for the walling throughout, with Westmoreland slates for the roofs. The block plan shows the arrangement of the scheme, which is the first complete establishment of its kind promoted by a municipal authority in this country.

## FRAGMENTS OF SIXTEENTH-CENTURY WOODWORK.

THE fragments of 16th-century French woodwork are all executed in oak, and I gathered them together just to show the refinement of the mouldings and turning about that date. The old Chair in Holyrood Palace, Edinburgh, is a splendid example of the old oak stiff-back chair, of which there are several in Holyrood Palace, together with some fine old tables and tapestries. The colour of the chair is a very dark brown, and it is in very good condition.

J. DOUGLAS TRAIL.

THE photographic processes of reproduction are now so available that we venture to suggest that in many cases it is hardly worth while to send us drawings for reproduction. For measured work, for details, competitions, and the like, the services of the draughtsman will, of course, always be indispensable; but for average executed buildings, statuary, furniture, &c., a photograph is frequently in every respect as useful; and as, generally speaking, it would occupy less space, we should be able to give more subjects—especially in cases where the indifference of the drawing not infrequently influences the rejection—of churches, chapels, villas, &c.

## ROYAL ACADEMY ARCHITECTURAL DRAWINGS, 1899.

THE days for sending in drawings and paintings this year have been fixed for March 24 and 25, the last day being Monday, the 27th. Sculpture will be received on the 28th.

Our friends and contributors who are willing to allow us to reproduce their drawings before they are sent to Burlington House, so that their works may be included in our series of illustrations from the Royal Academy Exhibition, to be published after the opening day, are invited to let us have them as soon as convenient for this purpose. We will return the drawings quickly, or, if desired, we are willing to forward them to the Academy direct, provided the necessary labels and letters to the Secretary are attached; and we will do this free of charge.

## CHIPS.

The death occurred in Paris last week, at the age of 69, of M. Jules Cousin, for many years curator of the Carnavalet or Municipal Museum of Paris, to which on his appointment he presented his own valuable collection of 6,000 books and 10,000 engravings. M. Cousin was the author of several antiquarian works.

The chancel of Axminster Church has recently been enriched by the addition of choir-stalls, altar-rail, and credence table, from designs by Mr. W. D. Caröe, M.A., of London. The work throughout has been executed in English oak, very finely carved and traceried, and was carried out by Mr. Wm. Dart, Ecclesiastical Art Works, Crediton.

The new pier question was before Yarmouth Town Council at its last meeting. The Bill of the Britannia Pier Company for the reconstruction of that pier at a cost of not less than £60,000 was approved by the piers committee, who also recommended that plans be prepared for a new pier on the jetty site at a cost not exceeding £35,000. After a long discussion the entire report was carried, with the addition of a proposal to instruct the surveyor to prepare separate plans for a pavilion, to cost £10,000, at the entrance to the jetty. The council also adopted a scheme for a public abattoir.

The Tramways Committee of Aberdeen Town Council unanimously adopted on Friday the report of the deputation to Glasgow on the best method of equipping the Woodside route for electric traction on the overhead trolley system. Mr. Dyack, burgh surveyor, and Mr. Bell, electrical engineer, recommended, as a method of suspending the overhead conductors, the span wire system for the section from Union-street to Kittybrewster, supporting the span wires as far as possible from ornamental rosettes fixed to the houses along the route. Where this was impracticable, the erection of side poles was suggested which would also be available for the purpose of lighting the street by means of arc lamps. The estimated outlay on equipment is £35,300.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 80c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLVI., XLIX., LI., LII., LIV., LV., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

M. S. A. (We should hardly call their rubbish "joinery"! Go to a good firm like W. H. Lascelles and Co., of Bunhill-row, or B. E. Nightingale, Albert Embankment.)—H. L. D. (You will find good, reliable firms in our "Directory." The people you mention dropped out of these pages some time since, and can hardly be doing much now.)

RECEIVED.—T. C. and W. H.—G. T. K.—S. S. and Co.—F. L. M.—R. B. G. C.—D. N.

## "BUILDING NEWS" DESIGNING CLUB.

## SIXTH LIST OF SUBJECTS.

F.—A Stable suitable for the premises of a gentleman's suburban house, to comprise four stalls and two loose boxes, a coachhouse for three carriages and space for cycles, a harness-room, groom's bedroom, and a hay-loft with shoot. Provide a covered washing space about 14ft. square or of that area. A simple brick and stone treatment to be adopted, in a picturesque and quietly dignified style. A clock-turret may be introduced, and a gateway leading into the stable-yard. A dung-pit and men's closet to be provided conveniently, but in a retired position. The entrance-front to face the south, and form the chief elevation. The group may be L-shaped in plan. Scale 8ft. to the inch. Plans may be smaller, to 1/16th scale. View necessary. Site level.

SWAN. (Received.)—ROOK. (If you will send your address, we will forward you the Rules of the club, when you will see all particulars required to be observed.)

## Correspondence.

## ARCHITECTURE.

To the Editor of the BUILDING NEWS.

SIR,—The London County Council, there is reason to believe, are not impressed by the beauty of the design suggested by the Royal Institute of British Architects for the Vauxhall Bridge, says your contemporary the *Graphic*. Considering the eminence of the designers, and the immense—almost awful—potentialities of Architecture to the Fifth Power, one marvels at the audacity of

the L.C.C. In the design prepared by the five eminent architects, there is abundant proof that its designers have profited by the lessons inculcated by the present President of their Institute, who, some years ago, in a lecture to students, strongly advocated the advisability of continuing the glorious traditions of Mediaeval architecture by the substitution of iron and cement concrete for the merely commonplace wrought stone construction of our forefathers. With this ennobling example before us, it is easy to see that what is suitable for a church is also eminently adapted for a bridge, and that the æsthetic properties of iron are not lost during the process of its conversion into mild steel.—I am, &c. —GOTH.

## SUPERVISION AND INSPECTION.

SIR,—Will you permit me, who has subscribed to the "B.N." for thirty-four years, to take exception to one statement in your Leader last week under the above heading?

The writer asks: "Whether the district surveyor can adequately inspect every such building in his district?" and then states that "Many serious mishaps and building accidents take place which favour the assumption that the supervision is not what it ought to be."

I maintain that this statement is utterly untrue, and I challenge the writer to name any accident or mishap to a building which has been brought about by the negligence of a district surveyor. The accident at Westminster certainly cannot be, as Mr. Drury did not superintend, owing to a claim of exemption, which claim the Queen's Bench has now shown to be wrong in law.

Even Leader writers should be careful of their facts.—I am, &c., HENRY LOVEGROVE.

## Intercommunication.

## QUESTIONS.

[12200.]—Walls.—Having to erect a villa residence in an exposed position, I should be glad of any information as to the best means of constructing the walls of faced brickwork with reference to economy—whether hollow walls (if so of what thickness) are best; or solid walls built in cement mortar, or with a cavity filled with composition, cost being the chief consideration.—CHELSEA-HAM.

[12201.]—Building Construction.—I am desirous of going in for the second or Advanced stage of the Building Construction examination held by the Science and Art Department, South Kensington. I have not attended the classes held in the small town in which I live, but am told that I can enter as "self-taught." Is this so, or not? If so, how should I proceed—apply here, or at South Kensington?—M. G. S.

[12202.]—Ink-Marks on Books.—How can ink-marks on the pages of books be removed? Is there some chemical that can be applied without injuring the paper?—READER.

[12203.]—Electric Lighting.—Is there any book published giving in a brief concise form, the requirements of electric lighting for buildings and a form of specification? A reply will be esteemed.—SOUTHERNER.

[12204.]—Westmoreland Slates.—Which is the best kind of slates, and where quarried; also their size?—A. T. O.

## REPLIES.

[12191.]—Architectural Tours.—Speaking from past personal experience, "Student" cannot do better than enrol himself a member of Messrs. Middleton and Carden's capital got up and most ably managed architectural tours. The next of the series starts to Italy for Easteride, leaving town on March 25, and is due home again the 18th of April. The inclusive cost for the 25 days is 30 guineas, which, considering the admirable and thorough manner in which Mr. Middleton generalises these useful, practical, and really most enjoyable excursions, is far cheaper than any solitary student can hope to cover the same ground for in the same time alone.—HARRY HEMS.

[12192.]—Sound.—T. Roger Smith's small work on "Acoustics" is a handy work, published by Crosby Lockwood and Co.—REGENT'S PARK.

[12192.]—Sound.—I conclude that Mr. Bassett wishes to know all about the acoustic properties of buildings, and I refer him to the works of Professor T. Roger Smith, A. Reid, and others. It is a very important subject, not very well understood, if we may judge from the many failures, and the wires and other contrivances in use in some important buildings.—H. L.

[12192.]—Sound.—The little treatise on "Acoustics" in Lockwood's series, written by Professor Roger Smith, is a very useful treatise, and contains many practical examples. There is also a paper published on the R.I.B.A. Transactions worth reading.—G. H. G.

[12193.]—R.I.B.A. Exams.—Get the treatise on "Masonry and Stonecutting" by Dobson, in Weale's Elementary Series, and consult "Notes of Building Construction," or Mitchell's "Building Construction," where "Student" will find no difficulty in ascertaining the kind of diagrams required for the final exam.—A. J.

[12193.]—R.I.B.A. Exams.—"Student" would find much on the subject of constructive masonry in

Rondelet's "Traité de l'Art de Bâtir"; its numerous diagrams of arches and domes could scarcely fail to suggest a subject for the testimonies of study. "Practical Masonry," by W. R. Purchase, would be useful; in it a diagram of a groined vault, with projection of stones, is shown.—A.R.I.B.A.

[12194.]—Inspection of Buildings by District Surveyor.—If, as I assume, "In Doubt" refers to a new building, the fee becomes due when the building is covered in; but the D.S. can order any irregularity to be removed until the building is completed to his satisfaction. If any alterations are afterwards made, the builder is bound to give notice of such fresh work.—H. L.

[12195.]—Estate Clerk of Works.—The requirements would vary, as in a country estate some knowledge of forestry, fences, land drainage would be required.—H. L.

[12196.]—Vagaries of Design.—"A Learner" has not kept himself abreast of the latest developments of art. The "astounding" character of a few of the designs he mentions for the Soane Medallion can be explained. They are, perhaps, extreme; but they represent the work of a band of rising architects who repudiate traditional forms as essential to honest construction, and the effect of this school is only a reaction against the commonplace attempt to reproduce historic styles. The principles of the school may be summed up in (1) Avoidance of traditional forms and details, (2) a plain treatment of wall surface. In which the requirements of plan are paramount, combined with sculptural relief and panels, well-emphasised masses, (3) good material and workmanship.—G. H. G.

[12197.]—Measurement of Stone Steps.—The details of measurement of spandrel steps are given in Leaning's work, or in Professor Banister Fletcher's "Quantities."—A. POPPL.

[12197.]—Measurement of Stone Steps.—The stone should be measured cube, and all labours super. It is impossible to teach quantity surveying in this column of the "B.N."—H. L.

[12198.]—Calculating Cubic Space for Ventilation.—"Ventilation and Heat," by J. S. Billings, published at New York, by *Engineering Record*—perhaps through Spens gives thus, p. 133, cubic space—

$$x = p + \frac{P}{A} - \frac{P}{A} 2.718 - \frac{A}{c}$$

in which—

x = number of units of CO<sub>2</sub> per cubic foot in air of room

at end of t hours.

P = number of units of CO<sub>2</sub> produced in room per hour

when it is occupied.

A = number of cubic feet of fresh air per hour introduced

(and also volume of air escaping during same time).

p = number of units of CO<sub>2</sub> per cubic foot in the fresh

air introduced.

c = number of cubic feet in room.

The numerical value of the last term in equation

diminishes rapidly as t increases and becomes insensible.

After a number of hours, depending on ratio of A to G,

the final value becomes—

$$x = p + \frac{P}{A}, \text{ whence } A = \frac{P}{x - p}$$

Example: Suppose man produces six units of carbonic acid per hour, and fresh air contains .004 such units per cubic foot, if it is required to maintain (of whatever size), constantly occupied by one man, in such a condition that the units of carbonic acid in a foot shall never exceed .006, then—

$$A = \frac{6}{.006 - .004} = 3,000;$$

that is, 3,000 cu. ft. of fresh air must be supplied per hour.

In this case, at the end of t hours after room begins to be

occupied, the number of units of carbonic acid per cubic

foot is .006 - .004 x C - 3,000 t, where c is number of

cubic feet in room. Suppose room equals 1,000 cu. ft., then

units of CO<sub>2</sub> per cubic foot are, at first .004, after one

hour .00590, after two hours .0059995, after three hours

.0059997; so after two hours room would sensibly reach

condition of .006 per cubic foot, &c.—REGENT'S PARK.

[12198.]—Calculating Cubic Space for Ventilation.—In answer to "A. J. R.'s" query, the quantity

of air required by an adult per minute, if a man makes

20 inspirations per minute, each equal to 40 in., he

requires 800 cu. in. per minute of fresh air. Roughly, a man

wants a cubic foot of fresh air per minute, for every

expiration contaminates twice the quantity of air inhaled

at least. Thus for every individual a space of about

600 cu. ft. is required, or a floor space of 60 ft. square, and

about 10 ft. high.—G. H. G.

[12199.]—Re Tithe-Rent Charge.—The lessor would be liable for the tithe rent charge; consequently any wise man, before building, would be careful to see that it was redeemed. Only a small portion of land is

subject to tithe, in cases only where the land was

originally church or glebe land. The proper quarter to

apply can easily be ascertained.—H. L.

Mrs. Thomason, wife of Mr. Yeoville Thomason, F.R.I.B.A., of Observatory Gardens, Kensington, and formerly in practice at Birmingham, died on Monday last, aged 81 years.

The new Liberal Club at Higher Trammere, Birkenhead, is now in course of erection. The building is of a Renaissance character, and will be of red brick with Brynteg-stone dressings. The accommodation will include assembly-hall to seat 400, billiard-room for three tables, smoking-room, reading-room, refreshment bar, kitchen, store-cellar, lavatories and cloak-rooms, retiring-rooms, &c. The contract is let to Messrs. John Lee and Son, Bebington, Cheshire, and the work is being carried out from the plans of Mr. T. Taliesin Rees, A.R.I.B.A., architect, Birkenhead.

## LEGAL INTELLIGENCE.

**EMPLOYERS' LIABILITY.**—At Southwark County-court, on Friday, before his Honour Judge Addison, Q.C., Thomas Cooper, a carpenter and joiner, sued William Shepherd, a builder, under the Employers' Liability Act, to recover damages for personal injuries sustained. The plaintiff was at work at the Borough Polytechnic on a board, which was supported at one end by a pair of tressels and at the other by an ordinary ladder, instead of another pair of tressels. The ladder slipped, and the plaintiff fell, breaking one of his legs, which was now about half an inch shorter than the other. His Honour awarded the plaintiff £100 and costs.

**IN RE JAS. JOHNSON, CREWE.**—At the Crewe Bankruptcy Court, on Friday, before Mr. Registrar Speakman, James Johnson, builder, of that town, attended for his public examination. The total liabilities amounted to £2,861 4s. 8d., of which £1,093 was expected to rank for dividend. The deficiency was £616 2s. 5d. The debtor attributed his insolvency to losses on contracts for buildings, and especially a large loss on sewerage and street-making contracts for the Crewe Corporation. He had not kept proper books. The examination was adjourned.

**LIBEL ACTION BETWEEN BUILDERS.**—At the Winchester Assizes last week, Mr. Justice Mathew and a jury heard the case of Jobbins v. Gale, an action to recover damages for slander. The parties are builders at Lee-on-the-Solent, near Fareham, and are rivals in trade. The slanders complained of were uttered on various occasions in the autumn of last year, and were to the effect that the plaintiff was an insolvent person, and unable to pay his way as a builder, and suggesting that he ought not to be supplied with goods on credit. As a result, a firm of timber merchants stopped the delivery of timber, and a firm of brickmakers refused to supply bricks to the plaintiff on credit. The defendant denied that he had ever uttered the slanders, and by his pleadings traversed the allegations of special damage in the statement of claim. Witnesses were called on both sides, but the jury ultimately found for the plaintiff, with £300 damages. Judgment accordingly.

**A HACKNEY ARBITRATION.**—GOODMAN v. SCHOOL BOARD FOR LONDON.—The claim in this case, heard in the London Sheriff's Court on Tuesday, was made in respect of a plot of land in Oswald-street, Hackney, comprising a frontage of 167ft. 9in., by a depth of 74ft. 6in. Mr. Josiah Goodman, the plaintiff (the freeholder), said that some years ago he had entered into a building agreement with a Mr. Motton to erect eleven houses, the ground-rent being £66 per annum. Mr. Percy Matthews, of the firm of Percy Matthews and Matthews, of 35, Bucklersbury, considered £66 a fair rental, and capitalised the same at 27 years' purchase, making a total of £1,802, plus usual 10 per cent., £180—£1,982. Several local builders were called to prove that the ground-rent was reasonable. On behalf of the School Board, evidence was given by Mr. Percy H. Clarke, F.S.I., of 2, Lancaster-place, Strand, who said this vacant land should be valued on the 5 per cent. table at 20 years' purchase, as the ground-rent was unsecured, and that it was worth £5 per foot frontage as freehold—£880 plus 10 per cent. for forced sale, £968. Mr. H. C. Roberts, of the firm of Inman, Sharp, Harrington, and Roberts, of 20, King William-street, gave a similar valuation, and stated that he had sold land adjoining to the Board at the same price. Mr. Marsh, a local agent, stated that the full value was £970. The jury awarded the claimant £1,563 10s.

Col. C. H. Luard held an inquiry on Feb. 24 at Ambleside into an application by the urban district council to borrow £1,000 for street improvements, and £4,500 for sewage and sewage disposal works. There was no opposition. Mr. Harry W. Taylor, A.M.I.C.E., of Newcastle-on-Tyne and London, is the engineer.

Dr. F. H. Tristram, Q.C., Chancellor of the Diocese of London, sitting in the Metropolitan Consistory Court on Monday, granted an application for a faculty authorising the opening up and laying out the churchyard of St. John's Church, Hoxton. It is proposed to lay out the grounds at a cost of £500 as a public garden.

With regard to the statement published last week concerning St. Paul's Cathedral, it is now announced that Sir W. B. Richmond, R.A., has been promised by Mr. Morgan, a New York banker, the sum of £5,000 to defray the cost of such an installation of electric light in the Cathedral as will light up the mosaic decorations.

The result of the operations at the Mart, Tokenhouse-yard, last week, must be pronounced very satisfactory. The business done amounted to no less than £331,137.

New county-court and Inland Revenue offices are to be built for H.M. Office of Works, in Westgate-street, Cardiff, on the vacant site between the new post-office and the County Club.

## WATER SUPPLY AND SANITARY MATTERS.

**FOREST ROW, SUSSEX.**—Owing to the increase in the population of this town in consequence of the popularity of golf on the adjoining Ashdown Forest links, Mr. E. Bailey-Denton, M.Inst.C.E. (Messrs. Bailey-Denton, Son, and Lawford), of Palace Chambers, Westminster, has been instructed by the rural district council of East Grinstead to report on the best means to be adopted for the sewerage and sewage disposal of the district in combination with Ashurst Wood. His estimate amounts to £14,040.

**LYNN.**—The new water-supply has just been informally furnished to the townsfolk. The water-works are the property of the town, and for three centuries abundant quantities of excellent water have been drawn from the Gaywood river. The settling ponds, filters, &c., had become so foul that twice during the last six or eight years have inspectors from the Local Government Board pronounced the water dangerous. Six years ago the then borough surveyor (Mr. E. J. Silcock) was directed to prepare plans for an entirely new system, and they were adopted. They consisted of sinking two wells into the chalk hills at Gayton, six miles from the town, driving headings, constructing a pumping station, rising and gravitation mains, and covered service reservoir. The wells are 14ft. from centre to centre, each 6ft. 2in. in diameter, and 100ft. deep. From the bottom of the wells headings 6ft. by 4ft. have been driven, as well as a borehole 8in. in diameter, and the quantity of water yielded is over one million gallons per day. The pumping machinery will eventually be in duplicate, and consists of two sets of boilers of the locomotive type, engines, and pumps, each capable of delivering a maximum of 1,250,000gal. per day through 6,243 yards of 15in. pipes, having a rise of 108ft. from the bottom of the wells to the top water level of the reservoir, which has a capacity of 1,000,000gal. two miles distant. The delivery main is 6,900 yards long, and is formed of 15in. cast iron pipes, the water being delivered at Lynn with a pressure equal to a head of 10ft. The works, which were commenced in 1894, have cost between £30,000 and £40,000.

## CHIPS.

A proposal is now being made to enlarge the boundaries of Dublin. The city area is confined to 3,808 acres, which gives the proportion of 67 people to an acre, including parks and open spaces, while what is known as the metropolitan district has an area of 24,768 acres.

The fine old mansion known as Riddlesworth Hall, dating from 1780 (the seat of Mr. W. N. L. Champion), which on the 10th ult. was the scene of a most destructive fire, will, we understand, shortly be rebuilt from designs of Mr. Herbert Green, of Norwich.

The Board of Trade have recently confirmed an order authorising the construction of a light railway between Didcot, in the county of Berks, and Watlington, in the county of Oxford.

At the last meeting of the city council of Exeter it was agreed, on the recommendation of a committee, that Mr. Herbert Read, of Sidwell-street, in that city, be employed to carry out the restoration of the stonework of the front of the Guildhall under the direction of the architects to the Society for the Protection of Ancient Buildings.

Mr. Silvanus Trevail, V.P.S.A., of Truro, who is at present in a private patients' home at Woodside House, Plymouth, is making satisfactory progress after a recent operation for an abscess in the back. The abscess was the sequel to a slight accident which Mr. Trevail met with in London.

The tramways committee of the Liverpool Corporation have discussed at great length the expediency of inviting tenders for the extension of the electric permanent way in half-mile or mile sections, or having the work carried out by day-labour under the engineer's supervision. By a single vote the contract system was rejected in favour of day-labour. The question is of considerable local importance, as the committee are about to expend £400,000 in permanent way extensions for the electric trams.

Mr. Jonas Watson, of The Lodge, Llandaff, one of the leading timber importers of Cardiff, died suddenly on Friday morning while with the Glamorganshire Hounds, near Cardiff. He was seen to reel and fall from his saddle, and when picked up was dead. Mr. Watson, who was the third son of the late William Jonas Watson, of St. Nicholas, Glam., was 69 years of age.

There has just been added to the National Portrait Gallery a bronze bust of Prince Charles Edward Stuart, which is considered one of the best likenesses of the "Young Pretender." The bust was modelled when "Prince Charlie" was about fourteen years old, and was brought from Italy in the latter part of the 18th century by Mr. Edward King, who was then Recorder of Lynn.

## Our Office Table.

THE new "Year Book and List of Members of the Society of Architects," now being issued from St. James's Hall, Piccadilly, is a smarter production than previous publications, and does credit to the recently appointed secretary, Mr. C. McArthur Butler. The membership roll has been carefully weeded by the Council, but still shows an increase in numbers, the figures for 1889 being 509 members, 17 hon. members, 10 associates, and 15 students—a total of 551, against an aggregate of 541 at the corresponding period last year. Three fresh standing committees have been formed, dealing respectively with the testing of methods and examinations for membership.

In the fortieth annual report of the Kent Archaeological Society, the secretary (Mr. G. Payne, F.L.S., F.S.A.) gives an account of the way in which the Romans set about road-making. "During 1897," he writes, "the laying down of a storm-water drain through the High-street of Strood revealed the formation of the road which passes through the town from Rochester Bridge. When the Romans made the great way from the Kentish coast to the north of England, a wooden bridge built upon piles was thrown across the Medway. On reaching the Strood side their engineers were confronted with a marsh about 355 yards wide. This difficulty they overcame by constructing upon the alluvial deposit a magnificent causeway. The workmen employed in laying the drain cut through the entire depth of the causeway to the mud at its base, thus enabling one to obtain a complete section of this remarkable work, as follows:—1, layers of post-Roman roads, 2ft. 8in.; 2, paved surface of causeway, 6in. to 8in.; 3, small pebble gravel, mixed with black earth, rammed, 9in.; 4, flints, broken fine, 7in.; 5, rammed chalk, 5in.; 6, flints (whole), rough pieces of Kentish rag, fragments of Roman tile, 3ft. 6in.; 7, mirsh mud, containing numerous oak piles about 4ft. in length, with pieces of wood laid at intervals across them, or perhaps they were originally made fast with nails. All the layers were exceedingly hard, requiring much labour to cut through them. The Kentish rag boulders forming the pavement of the causeway were shaped polygonally, fine pebble gravel filling in the interstices."

THE *Times* of Natal for Feb. 4th refers to the old stocks that formerly stood upon the site of the police-station at Pietermaritzburg as follows:—One of the most interesting of Natal's exhibits at the Grahamstown exhibition is the old-fashioned stocks which were lent by Mrs. Thresh, of the Imperial. If this interesting relic could speak it would tell us of the early history of Maritzburg. These stocks, as many people are aware, were employed for the punishment of the unruly before the colony was taken over by the British, and it fell to the lot of our old and respected citizen, Mr. Wolhuter, to see that a proper guard was kept over those who had the misfortune to be "put in the stocks." We may add that the Staats Museum at Pretoria (of which Dr. Gunning, M.P., is the esteemed curator) is already so crowded with models of Sir Donald Currie's steamers, and other things of more or less interest, that at present no room exists for any additions. Pietermaritzburg boasts of a good museum of its own, and should certainly do its best to secure unto itself the city's most ancient existing relic.

Sir Reginald Hanson, M.P., on Saturday, introduced to the Chancellor of the Exchequer a deputation from the City, who desired that, in the case of large buildings used as offices or warehouses, only such rooms as were occupied by clerks or caretakers should be assessed to the Inhabited House Duty, instead of the whole building. This, it was explained, would enable a large number of persons to live in the City who were now excluded. Sir M. Hicks-Beach, while holding out no hope that in the present year anything could be conceded that would involve a loss of revenue, asked for more precise information regarding the deputation's proposal.

The question of extending Dundee Esplanade was considered at a meeting of the works committee of the town council last week. It was decided to enter upon an extension westwards, at an expenditure of £10,000, and, further, that the wall shall be continued from time to time. The extension at present decided upon will result in 50 acres being reclaimed.

## MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Visit to Catholic Apostolic Church, Gordon-square. 2.45 p.m.

MONDAY.—Society of Arts. "Cycle Construction and Design," Cantor Lecture No. 3, by Archibald Sharp. 8 p.m.  
Royal Institute of British Architects. "Early Christian Churches in Palestine," by A. C. Dickie, A.R.I.B.A. 8 p.m.  
Surveyors' Institution. "The Working of the Light Railways Act, 1896," by F. J. Smith, F.S.I. 8 p.m.  
Liverpool Architectural Society. Paper by Edward S. Prior, M.A. 6 p.m.

TUESDAY.—Institution of Civil Engineers. "Water-Tube Boilers for Marine Engines," by J. T. Milton; and "Recent Trials of the Machinery of Warships," by Sir A. J. Durston and H. J. Oram, R.N. 8 p.m.

WEDNESDAY.—Architects' Benevolent Society. Annual Meeting at 9, Conduit-street, W. 5 p.m.  
Society of Arts. "Cornish Mines and Miners," by J. H. Collins, F.G.S. 8 p.m.  
Sanitary Institute. "The Establishment of Public Abattoirs in the Metropolis," by Dr. W. A. Bond, M.O.H., Holborn. 8 p.m.  
Northern Architectural Association. Annual Meeting. 7.30 p.m.  
Edinburgh Architectural Association. "Architectural Antiquities of Leith," by J. Campbell Irons. 8 p.m.

THURSDAY.—Society of Arts. "Leprosy in India," by H. A. Acworth, C.I.E. 4.30 p.m.

FRIDAY.—Birmingham Architectural Association. "The B.A.A. Excursion to Cambridge," by John Ward. 6.45 p.m.

## THE ARCHITECTURAL ASSOCIATION.

MARCH 11th.—VISIT to the GREAT CENTRAL RAILWAY HOTEL, Marylebone-road. Col. R. W. EDIS will conduct the Members over the Building at 2.30 p.m. A visit will be paid to the Great Central Railway Station adjoining.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

The public opening took place on Thursday night in last week of the "John Ruskin" School, Beresford-street, Newington. The building brings the total number of schools erected by the London School Board to 850. The new school has accommodation for 358 boys, 358 girls, and 422 infants, and is fitted with a unique system of heating and ventilation. The cost of the site was £7,928, and that of the building £22,504. The total, £30,433, represents an outlay of £26 14s. for each scholar.

At Bridlington, on the 23rd ult., the foundation-stone was laid of the Yorkshire Foresters' Orphanage and Convalescent Home by Bro. R. S. Kirk, of Leeds, and several memorial-stones were laid by representatives of the various Courts and Districts of Yorkshire. The building is being erected by Messrs. F. Blackburn and Son, of Hull, and the architect is Mr. Robert J. Beale, A.R.I.B.A., of 9, Victoria-street, Westminster, whose design was selected in competition.

The most prominent building—a school—in all that is left of what was once one of the most fashionable parts of Edinburgh—Society-Brown-square—was practically destroyed by fire on Saturday morning. The school, one of the old Heriot institutions, was built in 1845, and has been used by the Heriot-Watt College for their classes in book-keeping, writing, and geometrical drawing for some years past. The damage, which is estimated at from £1,500 to £2,000, is fully covered by insurance.

Messrs. Wm. Potts and Sons, clock manufacturers, of Guildford-street and Cookridge-street, Leeds, have just erected a new hour striking clock at the new Acute Hospital, West Yorkshire Asylum, Wakefield, with Lord Grimthorpe's double three-legged gravity escapement and compensation pendulum, automatic lighting apparatus, &c., for turning on the electric light. There are four external dials 4ft. 6in. each in diameter, and the hours are struck on a 6cwt. bell. Messrs. Potts and Sons are also fixing the new turret quarter-chime clock at the Newcastle Asylum for Mr. Dyson, F.R.I.B.A., architect, of Newcastle-upon-Tyne.

The Mersey Docks Board propose to expend about £200,000 in widening and deepening the entrance to the Alfred Dock at Birkenhead, so as to admit vessels of the largest class likely to be constructed. It is expected that the entrance will be about 100ft. wide, and various other improvements will be made to bring the dock up to date.

Mr. George Lewis Heins has been appointed State Capitol Commissioner of New York, to succeed Mr. Isaac G. Perry. The position involves supervision of all the hospitals, armories, reformatories, and other State buildings. He is a well-known architect in New York, being in partnership with Mr. C. Grant Le Farge, the chief work of the firm being the Cathedral of St. John the Divine, now in course of construction in New York.

## Trade News.

## WAGES MOVEMENTS.

ABERDEEN.—The operative painters have made a demand for an increase of 1d. per hour on the present rate of wages of 7½d. They also request that the by-law prohibiting jobbing should be rescinded. The operatives number between 300 and 400, and unless the concession is made they threaten to strike.

CHESTER.—A movement has been on foot for some time among those engaged in the building trade in this district for an advance of wages, and it has culminated in the masters being served with notices from the different trade unions. The carpenters and joiners ask for an increase of wages and a reduction of hours, as also do the bricklayers and plumbers, and the labourers also demand an advance. The expiration of the various notices takes place on different dates in May, June, and July. There are about 900 men engaged in the building trade in the Chester district, and though they are not by any means all union men, the great bulk of them will be effected. The demands are regarded by the employers as unreasonable.

HAMILTON, N.B.—In conjunction with the associated joiners of the district, Hamilton joiners have made an application for an advance of ½d. per hour in their wages, to date from March 1. Masters have offered ½d. at that date, and ¼d. three months later. The men have refused this offer, and are expected to take measures to enforce their demand.

## CHIPS.

The Board of Trade have recently confirmed an order authorising the construction of a light railway from Trowse, a suburb of Norwich and a junction on the Great Eastern Railway system, to Beccles, Suffolk, the junction for the Waveney Valley, Ipswich, Yarmouth, and Lowestoft lines on the same system.

Mr. E. H. Harbottle has been appointed hon. architect to the Devon and Exeter Hospital Committee.

The parish church of Lingwood, Norfolk, was reopened last week after restoration. The architect was Mr. A. J. Lacey, of Norwich, and the builder was Mr. Riches, of Postwick. The stonework was executed by Mr. Utting, of Acle.

New works of water-supply at Rainow, for the supply of the township of Bollington, North Cheshire, were formerly opened last week. The works have been carried out for the Bollington Urban District Council at a cost of £11,000. Mr. Radford was the engineer, and Mr. Bowers the contractor.

As the tenders received for the proposed new market-hall for Ilfracombe have greatly exceeded the estimates of cost, the urban district council have shelved consideration of the amended plans for three months.

The district schools at Hanwell are about to be extended by building on an adjoining site an infants' department at an estimated cost of £5,500.

Mr. H. P. Boulnois, C.E., Local Government Board inspector, held an inquiry at the Market Hall, Brixham, on Friday, into an application by the urban district council for permission to borrow £2,500 for street improvements.

FRIDAY, MARCH 10, 1899.

### MODERN IMITATIONS.

IMITATION has been said to be "the sincerest form of flattery." We do not imitate another man or his work unless we give a tacit approval of his conduct or his labours. We must acknowledge the cleverness or goodness of the work of art before we are brought into the state of mind to copy it, and in this sense the old saying is very true. But there is a way of imitating a thing that ought to be taken into account. We may copy a stone building in stucco; but by so doing we scarcely show our good taste or our flattery. Nor can it be said we show our good sense in imitating a piece of wood-carving in another material, or by another method altogether; nor by imitating a beautiful piece of veined marble on wood, or by any painted simulation of oak or maple. All these imitations, being untrue, are scarcely flattering to the original.

Imitations of one sort and another seem to be the order of the day. We have not only architects finding fault with the use and publication of designs they lay claim to as their own, but manufacturers in various materials producing designs that were originally invented and adapted only for stone, wood, or metal. The idea appears to be popular that when once a design has been made it is common property, and can be used, without any scruple, in a variety of different ways, and in fabrics of every conceivable kind. With respect to architectural designs, the onus of proof rests often with those who complain. They assert, in fact, that the thing or feature copied is their own, that they were the originators of it, and that no one has a right to steal their ideas. Probably in some instances such people imagine they have a right to claim their design as original, whereas in point of fact they have unconsciously been adapting some older work that they have seen or sketched; their minds are stocked with ideas and images of older work, and when they design any building these ideas come up, so to speak, unbidden. There are a few who do originate as they proceed; but still the greater number will be found to have adapted, or their designs have been suggested by, another building. And these claimants to originality are generally the most obstinate in their protests. The real crib does not like to be copied, for in his case it is certainly not the "sincerest flattery."

On the other hand, the value of a good copy depends on how much the copyist exercised his judgment. His application of the design may be more really discriminative than that of the man who first introduced it. Thus: If it is a gabled end with window that is copied, one man may use it for a building where it does not express any meaning, another makes it appropriate. One man copies the feature in a brick building where the lights and mullions are not suited, the other uses it in a stone building to give increased light where light is most wanted. So that the argument amounts to this: There is good and bad imitation. Good imitation may be really laudable, when its author rightly conceives the purpose of the original designer, and applies it to his work, honestly to the proper material, whereas bad imitation defeats the intention of the design and is a mere travesty. To speak of manufactured imitations raises a very important question, and one we have always regarded as of the essence of good design. The discussion that took place

the other day at the Society of Architects on the very interesting paper by Mr. Scruby on Lincrusta-Walton—and by inference on all other decorative materials and their proper use and treatment—opened a wide door for the expression of opinion. There are many people who employ decorations of this kind, including architects, who are not very careful to distinguish between a right and improper use of them. It was satisfactory to find there was a general consensus of opinion at the Society that such decorations as Lincrusta, useful and valuable as they are as wall and ceiling linings, could not be honestly applied as the imitation of panelling and carved woodwork. As Mr. Ellis Marsland put it, "Lincrusta-Walton resembled leather hangings; but instead of the stamping being on leather, it was done on another material." There was no objection to the imitation of embossed leather patterns on similar materials. Both of them admitted of this treatment admirably; but when the attempt is made to imitate oak and wood carving by the same process, it is going beyond the proper treatment of the material. The same argument applies to all those kinds of materials which are not treated or used in a natural sense. Each has its limitations. We remember the time when wallpapers were printed with representations of temples and architectural detail, and garlands of flowers. Bad as these were, they were not so objectionable as the raised relief patterns representing architectural panelling in wood, oak carving of pilasters and arabesques. All plastic substances—from plaster to modern wall materials—can only be legitimately treated as moulded or stamped, and therefore the design ought to be in low relief, and of such a character as to adapt itself to surface ornament of a not too rigid or formal kind, and suitable for uniform-grained materials without fibre; such as is best represented by such patterns as simple reticulations, diapers, strap ornament, and folial conventions. The flat wall surface and the ceiling are the proper fields for ornamental relief of this kind: directly they assume structural features like pilasters, entablature, pediments, canopies, &c., they are transgressing their true purpose. The very nature of embossing precludes anything like sharp angles and decided architectural forms. Imagine, for instance, what it would be to try and get sharp impressions of mouldings in leather or in thick metal by stamping. The material would break at the angles. What is possible in plaster modelling or casting or in gesso work would be impossible in leather or any material beaten up from behind.

In these days of manufactured imitations, there is a demand for reproduction in cheap materials. The man who cannot afford to purchase a fine piece of *repoussé* or chased metal-work will content himself with a modern imitation: instead of a fine oak carved sideboard, he will buy one made of wood pressed into a mould, with its fibres crushed and spoiled, instead of modelled plaster or gesso relief on his walls; he is ready to accept even two coats of paint and a veneer of machine-printed wall-papers or some embossed hanging. The mania to mimic old masterpieces is seen in every modern house in its furniture and decoration. Enthusiasm for antique art is not a bad sign in itself: it shows that people like to have evidences of art about them; but the modern phase of the feeling lacks enthusiasm, and Emerson has told us that all the arts have had their origin in some enthusiasm. Let the architect guard himself against a too easy compliance with his client's taste for imitations. Let us at least be true to our materials, never losing sight of their natural qualities and limitations, for in such an exercise of honesty we shall more likely emulate the best and noblest work of the past.

### MODEL SPECIFICATIONS.—LV.

#### GASFITTER.

THE ordinary mode of arranging gaspipes is to take a pipe from a meter on the basement, diminishing its size at each successive floor; thus, if the pipe from meter is  $1\frac{1}{2}$  in. bore, it will be  $1\frac{1}{4}$  in. bore on the first floor, 1 in. bore on the second floor,  $\frac{3}{4}$  in. bore on the third floor, and so on. The lower floors have generally more lights, and therefore this arrangement is reasonable. (See sketch.) All runs of pipes, positions of rising mains, and gas-fittings, whether stoves, pendants, or brackets, should be shown in the plans, and the sizes of all pipes

marked at the points of variation, the rule being followed that the fewer the number of burners the smaller the bore of the pipes. Pipes should have screw-joints and be put together with red lead, and the wall-hooks and clips should be at intervals of not more than 6 ft. for pipes of  $\frac{1}{2}$  in. to  $\frac{3}{4}$  in. A separate branch from rising main for each story is necessary in large buildings, and every main should be exposed to view or easily accessible.

Specify connection with main, size of rising main, and all pipes to be tight and clear in bore; the service-pipes above ground should be incased in deal and be protected by felt. It is, perhaps, the best course to provide a sum for fittings and fixing in the contract, to be done by a well-known firm, the architect to direct. Provide a clause for testing the piping at the completion. The outlets should be securely capped with screw-plugs, and the system tested by a water-gauge and gasfitter air-pump, the pressure raised to 18 in., and left for some hours to see whether the pipes are tight. All cheap composition pipes are to be avoided. Provide that all the fittings, &c., are to be supplied by an established house—such as Messrs. Strode and Co., Osnaburgh-street, or other firm—and specify particular fittings, their numbers and prices from catalogues. Gas-meters are usually hired from the gas company.

1. *Generally.*—The gasfitter to carry out the work agreeably to the regulations of the Gas Company. The pipes to be of the best quality wrought-iron (or galvanised) welded tubing, with screwed joints. All lead and composition pipes to be condemned. The internal tubing to be of the following sizes:—For the six-lights  $\frac{1}{2}$  in., for nine lights  $\frac{3}{4}$  in., for twenty lights  $1\frac{1}{2}$  in. The pipes up to 1 in. diameter to be butt-welded; the larger ones lap-welded, and to be free from splits or flaws, and of uniform section, and must be tested by hydrostatic pressure of 60 lb. to the square inch. Or—

The gasfitter to conform to the regulations of the gas company of the district. The pipes to be Russell's patent wrought-iron welded tubing,

with all necessary bends, ties, angles, &c., jointed in red-lead cement. Provide 50ft. of  $\frac{1}{2}$ in. pipe, 60ft. of  $\frac{3}{4}$ in., 30ft. of 1in. pipe.

2. *Meter.*—The company to supply and fix a gas-meter for 50 (or more) lights, tested and fixed in the basement (or in lobby near entrance), and easily accessible, and the meter to be connected by the company with the street service and house-pipe, with unions of the size prescribed by Board of Trade.

3. *Service-Pipe.*—The gas company to lay a service-pipe of sufficient size to supply all present and future requirements from the street main.

4. *Connect Meter.*—Connect meter with main by 1in. strong lead pipe and brass connections (or the gasfitter is to request the gas company to make the connection with main and with house supply), and fix where directed 1in. brass gas-main cock.

Or—  
Give notice to gas company, pay all charges for extending gaspipe to building, and instruct gas company to supply and fix in a convenient position upon wooden bracket approved a gas-meter for 30 or other number of lights, the same to be tested, as well as all pipes.

5. *Stop-cock.*—Provide a stop-cock on the main side of meter to shut off supply if necessary.

6. *Branches.*—Fix all upright branches plumb with level nipples of proper length for fixtures, and all drop centre pipes to be perpendicular, and project about 1ft. below the furring.

The gasfitter is to consult architect as to the position of all pipes and fixtures. All cutting of wood or concrete, &c., to be done only with his approval. The pipes to run as direct as possible, falling towards the rising lines and gas-meter, without sags, and all long runs of piping to be securely supported with wall-hooks, &c., to prevent sagging.

7. *Fittings.*—Provide the sum of £— for fittings, to be expended as directed by architect. Or—

Provide  $\frac{1}{2}$ in. tubing for all rooms on the ground, first and second floors;  $\frac{1}{2}$ in. tubing to kitchen and gas-stoves, &c., and finish them with approved fittings of the following p.c. value. Kitchen fittings to be selected from catalogue of Messrs. Strode and Co., and allow sum of £6 for each stove. The ground-floor fittings to be selected by the architect, or allow sum of £— to be expended as directed. Or—

8. *Pendants.*—Provide five-light pendants and six brackets with all ceiling-plates, nipples, and roses for brackets.

Provide and fix on first and second floor, fittings of the p.c. value of £8, selected from catalogue to architect's satisfaction. Or—

Provide two or three-light bronzed iron pendants p.c. value £2 each, fixed to bearers on joists, with Strode's burners and opaque shades. Or—

9. *Brackets.*—Provide double-jointed bronze gas-brackets p.c. value 18s. each, with mahogany wall-block and rose, &c. Or—

Supply and fix the following fittings, including a ceiling-plate for each pendant and a polished mahogany rose to each bracket, to be approved. The fittings to be made by Messrs. Strode and Co. (or other selected firm), and to be of the selected numbers and sizes given below for the positions marked. (Here give detailed list of pendants and brackets and number of burners and positions.)

The following are more detailed clauses:—

10. *Make Connection.*—Open ground in road to company's main, and connect thereto with  $\frac{1}{2}$ in. screw ferrule, and take  $\frac{1}{2}$ in. wrought iron welded gas-tubing to building, incased in a deal trough, tarred, and filled with pitch. Continue  $\frac{1}{2}$ in. pipe to a Stott  $\frac{1}{2}$ in. patent gas-governor in basement, and connect to meter with stout lead pipe and brass unions, as prescribed.

11. *Outside Main Stop-Cock and Siphon.*—If the service-pipe from main descends to basement of house below area in front, specify:—"Connect the  $\frac{1}{2}$ in. pipe from main to a full-way brass stop-cock to shut off gas, fixed in an iron chamber bedded in concrete, and also to a gas siphon box also bedded in concrete, with labels on each." (The siphon collects the condensed water that may form on the descending pipe). The Stott gas-governor is made for pipes from  $\frac{1}{2}$ in. to 3in. diameter. Or—

12. *Casing to Main.*—The main underground to be laid on a rough  $\frac{1}{2}$ in. red deal trough, well tarred, and filled with hot pitch; and a cast-iron siphon-box is to be placed in area where shown, with iron cover let in paving. Take main from siphon to meter, and provide a stop-valve in box, with locking lid, in pathway, to turn off gas from building.

13. *Gas Meter.*—Instruct gas company to fix a light dry (or wet) meter, and fix on wrought deal brackets perfectly level, and inclose with wrought deal matched and beaded boarding, with door, &c.

14. *Rising Main.*—Connect to meter with proper brass connection, with  $\frac{1}{2}$ in. brass stop-cock and spanner, and T-piece fitted with screw-plug for escape of condensed liquids in tubing, and take  $\frac{1}{2}$ in. vertical main to entry of ground floor, thence, with  $\frac{1}{2}$ in., to ceiling of first floor, thence, by 1in. piping to second, and  $\frac{1}{2}$ in. tubing to third floor.

15. *Branches.*—The branch-pipes to be of the sizes as follows: (here specify the bores) or say  $\frac{1}{2}$ in. tubing to basement to 15 lights and gas-stoves,  $\frac{1}{2}$ in. tubing to ground-floor to 15 or 20 lights,  $\frac{1}{2}$ in. tubing to first floor to 15 lights,  $\frac{1}{2}$ in. tubing to second floor to seven lights,  $\frac{1}{2}$ in. tubing to attics to three lights,  $\frac{1}{2}$ in. tubing to hall and staircase to four lights,  $\frac{1}{2}$ in. tubing to billiard-room for 6-arm lights, &c. These positions are to be determined by the architect (or marked on plan), care being taken that each branch is of sufficient capacity, and taken from the vertical main or main branch.

16. *Special Branches.*—Take  $\frac{1}{2}$ in. (or 1in.) tubing to gas-stoves (four positions) in kitchens, with stop-cocks, and allow sum of £4 (or £7) for each stove (or the stoves to be provided by Strode and Co., Osnaaburgh-street).

Also take  $\frac{1}{2}$ in. tubing to billiard-room for a six-arm light, and provide p.c. sum of £3 10s. for same, or specify Messrs. Strode and Co.'s fittings. Take to bath-room  $\frac{1}{2}$ in. tubing for geyser, with stop-cock, and allow p.c. sum of £5 for geyser; also the same size pipe to w.c.

17. *Fittings and Burners.*—Provide and fix the fittings manufactured by Messrs. — (here specify name of firm, and quote numbers in trade list). Or—

The hall, drawing-room, and dining-room to have Argand (or regenerative or incandescent) burners, and to be fitted with pendants or sun-burners (give Nos. of patterns and value p.c. from trade lists of Messrs. Young and Marten, Stratford, or other firm).

18. *Test Pipes.*—The gas-pipes to be tested to a pressure of —. Plug all outlets with screw plugs, and provide and fix all necessary full-way brass stop-valves with loose keys, brass unions, &c. Or—

Give notice to gas company, pay all charges for bringing on gas, test the pipes, and leave perfect at completion.

19. *Attendance.*—Attend upon, cut away for, and make good after gasfitter, in all trades.

#### PUBLIC BATHS.\*

IT is not my intention to go over the ground so ably traversed by Mr. Hessel Tiltman in this room about a month since,† when he described the broad lines and the general disposition of public baths and washhouses. I have proposed to deal with the subject much more modestly, and rather with constructive details. It is difficult to lay down hard and fast rules for the

#### PLANNING

of any class of building in London, if only because of the restricted area and often extraordinary configuration of the sites which are chosen by enlightened public bodies, it would almost appear, with the idea of setting prize puzzles to aspiring architects. In most other countries the best sites are always reserved for public buildings—in London for enterprising speculators. Generally in Continental towns nearly every public building of any importance is bounded by streets on at least two sides. If the architect gets one fairly good frontage in London he is lucky. But our very difficulties in this way stimulate inventiveness, and nowhere in the world can more ingenuity in planning be found, nor have greater triumphs been achieved in making the most of limited opportunities, than in this huge conglomeration of buildings called London. Given, however, a fair site, the least we can do in making our plan is to study carefully the uses of our buildings and the essential requirements of their administration, and then to concentrate all our attention upon so arranging the various parts of the building as to fit these requirements, and to render future administration as easy and economical as possible. In planning a building to insure or make possible wise or true economy in its administration, we mean arranging the various parts in such order as will enable those who administer it thereafter to do so with the least waste of human energy. It is only just

\* A paper read before the Architectural Association on March 3, 1899, by A. SAXON SNELL, F.R.I.B.A.

† See report of R.I.B.A. meeting in our issue of the 10th ult., pp. 189–190.

to our clients to say that this point is largely recognised by them to-day, as can be shown by the lavish expenditure upon glazed bricks, majolica, and other surface decorations, the great first cost of which is so soon repaid by their permanence, and the small cost of maintenance.

We, as architects, are much more interested in the first cost of a building than in its subsequent maintenance; and it is, therefore, also our interest to build well from the first. That is by the way; it does not benefit us alone. Indeed, our share is, comparatively speaking, small; the benefit to the client far greater. Those who, like myself, have had the privilege of going over the new baths at Shoreditch will agree with me that we are improving in our ideas as to what a public building should be. A little sign of this is afforded by the growing tendency in competitions not to hamper the competitors by a fixed price. May the tendency grow into custom! Another is the custom of visiting other institutions to learn what is their best, and then to go one better. We of the younger generation of architects have a good time before us, and it behoves us to rise to the occasion, and endeavour to inaugurate a new Renaissance in architecture, not only in purely architectural features, in new methods of construction, in the use of new materials, and a better knowledge of the old ones, but particularly in our ideas of space and order. So we may foster the growing imagination of our clients, and lead them on to yet higher ideals, yet nobler effects. In that day the architect may be honoured in the land, and always get his name mentioned (and spelt correctly) in the daily papers when they describe a building. In public buildings, the simpler and more direct our plans, and the greater the proportion between the rooms and passages, the better.

#### A MODEL DESIGN.

I have thought it well to try and realise what one would do with a fairly unrestricted site for a moderate-sized establishment; the plan is, perhaps, not perfect, but it will suffice for my purpose. This design may, indeed, be regarded in the light of a diagram, such as are sometimes given out with the conditions of competition to indicate the lines upon which the client desires to have the building arranged. I may be permitted to anticipate a criticism which will, or should, occur to some of you, and it is this:—Mr. Tiltman foreshadowed a different classification and distribution of baths in the near future, and his remarks upon this point were by no means the least interesting and suggestive part of his paper. You may be disposed to ask why I have not planned my building upon future rather than present-day ideals, especially as I have proclaimed my sympathy with the former. I can only say that until these new ideals have been well ventilated, it is impossible to say in what form they will be best adapted to the peculiar conditions of our own country. Moreover, the principles I shall draw from the diagram will, I believe, be applicable as much to future as to present-day planning. Let me take you through the building, pointing out, by the way the *raison d'être* of the various parts. It comprises three swimming-baths, respectively for first and second-class men and women; and eighty private baths allotted to the two classes and sexes in the proportion laid down in the Public Baths and Washhouses Acts. We will commence with the entrance waiting-hall, which should always be

#### THE KEY TO A PLAN.

It is about 30ft. by 20ft., and undivided, entered from the public street by a short and wide vestibule, and dominated by the pay-office in the rear. The first point some of you will notice is that I have only one entrance, which you will say is unorthodox. So it is; it is usual to have at least two entrances—one for men and another for women. In many baths there are as many as four, respectively for first and second men, and first and second women. I hope the time is coming—and that soon—when we shall recognise that it is not necessary to have separate booking offices and entrances for men and women in libraries, railway stations, and other public buildings, it should not be necessary for public baths. When this is recognised we shall do away with one of the most hampering restrictions there is in planning these buildings. The hours I have myself spent in endeavouring to design a pay-office which should serve four separate entrances, and yet be decently lighted and ventilated, I feel sad to think of. Of course, when there is a public washhouse attached to the baths, two entrances at

least are absolutely necessary. In such a case make, if possible, the second entrance serve also for the second-class women's baths. Ladies find it less objectionable to meet a rough class of men than the same order of women. Another point to which I draw your attention is the

#### SMALLNESS OF THE HALL AND CORRIDOR AREA

compared to the size of the building, which is due in some degree to the one-entrance plan. Practically the same result has been obtained at the Plaistow Baths, although the entrances are separated. Whatever may be said in favour of a large entrance-hall (and I myself would have it of ample size) little can be urged in favour of corridors, especially long and tortuous corridors. They take up room, cost much to build, and more to maintain, clean, and overlook, and show weak planning. On one side of the vestibule is the superintendent's private office, and on the other a staircase to his apartments above. Except in quite small baths, it is a mistake not to provide a separate office, in addition to the pay-office. The pay-office itself should be about 100sq.ft. to 150sq.ft. (not larger), and fitted all round with shelving for towels and bathing drawers, &c. In an establishment of this size two pay windows are necessary. It is desirable for many reasons (not the least being that of commanding the entrances, &c., from all parts) that the front and sides should be glazed in the upper panels, with obscured glass to the height of 4ft. from the ground, and above with clear glass. If you can afford any luxuries in the way of expensive fittings, joinery, pavings, &c., your clients will raise less objection to their use in the entrance-hall than elsewhere. The superintendent's office should also always be close to the entrance, as many people come to see him who should not be allowed to pass into the building generally; 150sq.ft. is quite large enough. On either side of the pay-office are lobbies and short corridors—the shorter the better—leading to the swimming and warm baths.

#### CENTRAL POSITION FOR THE FIRST-CLASS BATH.

You will see that the first-class men's swimming-bath is placed centrally, with those for second-class men and for women on either side, the warm baths naturally being on the corresponding sides. The provisions of the Baths and Wash-house Acts as to the proportion of numbers between the classes make it difficult to preserve symmetry in planning. Now my reason for placing the first-class bath centrally is that, in all probability, it would be convenient to alternate its use for first-class men and first-class women; and this may often be conveniently done, because ladies prefer to bathe, if at all, in the morning, whilst the men's baths are always filled up in the evening. It is also in a convenient position for use as a winter gymnasium, alternately for men and women. The shorter length of the second men's and women's swimming baths leave room for the boiler-house and engine-room, and the establishment or towel laundry, &c. These are not infrequently placed together, but it is not a necessary arrangement, and is, indeed, undesirable if women are to be employed in the laundry. The subway under the end of the first-class bath affords access from the engine-room to the boiler-house. If the site permits, these departments may be advantageously placed in the basement; but, if so, we would never make the mistake of depriving them of light and air. A system of subways is almost essential in public baths, and if possible all main pipes for drainage and hot and cold water supply and heating should be fixed along their walls or ceilings, where they can be repaired or renewed without disturbance or injury to the rooms above. Both at Marylebone and Plaistow, and also Stratford, I have subways under every part of the building. The superintendent's apartments will, of course, be placed on an upper floor over the front centre of the building; and one of the most important points to observe is to arrange the approaches so that the damp warm air which invariably hangs about even the best-ventilated baths, cannot find its way in to the rooms. There are not a few superintendents who can speak feelingly upon this point. A small area or a way out on to the flat is very desirable. It is usual to provide about six rooms, and they should not be too small. It is not the most enviable existence to live and work all day in the atmosphere of public baths. Now I propose to take the various parts of the building in detail, but before commencing I would draw your attention to certain

features in some of the plans round the room, many of which have been most kindly lent me for the evening by their authors. I call your attention, however, first to one which was not lent me by the author. I had it enlarged from a small plan in one of the building papers, where it was ostentatiously labelled as having been designed by a superintendent engineer. The name of the architect "for the erection" was also given, and I am inclined to think that it was the latter who published the plan with a suspicion of sardonic humour. The least I can say of it is that it contains a number of things which are not to be commended. Note the plan of a bath designed by Messrs. Harrington and Lee now in course of erection at Romford. It appears to me to be a model in its way of good arrangement for a very small set of baths. We have another small example in the bath erected at Alloa, near Glasgow, from the designs of Messrs. Burnet, Son, and Campbell. I cannot quarrel with the want of directness in the passages to the warm baths, for instance, because the very breaking away from the simple austerity of planning is made use of for some charming architectural effects. A small set of Turkish baths, with a separate entrance and a billiard-room, is provided. I have ventured to show also the plans of the St. Marylebone Public Baths, and two sets for the borough of West Ham, each of which may not be without interest as examples of the application of these theories applied to three very different sites.

#### THE SWIMMING-BATH.

The general arrangement of a swimming-bath is too simple and too well-known to need much description. It is invariably a large hall, inclosing a bath, the essential point of which appears to be that it should be as big as circumstances will allow. This is surrounded on all sides by a pathway or platform, as it is called, and a number of dressing-boxes arranged along each wall. With respect to the bath itself, I do not myself advocate a greater length than 100ft., and a very good width for this length is from 30ft. to 35ft. In deciding upon the dimensions of a bath, we have to bear in mind that water costs in London about 6d. per 1,000 gallons (often much more and seldom less), and if a bath is emptied and filled only three times a week the expense is heavy if the size is greater than need be. Of the three dimensions, I should place first in importance the length, and next the depth and width. One of the most popular uses of a good bath is as a swimming racecourse, and as the unit of length in races is always the yard, and the divisions mostly multiples to 100, it is acknowledged by swimmers that 100ft. is a very convenient length for a racing bath. Three lengths go the hundred yards; twenty-five and thirty yards are easily measured off. Our water depth should vary from 3ft. 6in. to 6ft. 6ft. or 7ft.—in second-class baths 3ft. to 6ft., the latter being used far more by boys than grown men. Theoretically, the deepest part of the bath should be about 10ft. from one end, because that is where a high diver would, generally speaking, strike the water. The level of the water should not be less than 12in. below the footway curb, and this level is maintained by the overflow trough, which it is usual to place along the wall at the deeper end. This overflow has been variously contrived with an iron projecting gutter, a series of holes, or a sunk gutter hidden by a flush brass or iron grating. The best form I have seen is that adopted at Shoreditch, which is a large moulded trough made in long lengths of majolica. For neatness of appearance and also economy, Mr. Tiltman's white glazed sunk channel is nearly, if not quite, as good. A small modification would improve it. In the most usual form of bath tank, the walls are constructed of cement concrete built battering on the outside; but I prefer brickwork in cement carefully calculated for strength and well buttressed. The bottoms must always be of cement concrete, and if the foundation is good, 12in. is quite thick enough. Some advocate building the tank entirely separate from the walls of the bath hall to avoid any possible unequal pressure on particular parts, and consequent danger of settlement. But the immense strength necessary for holding the water alone leaves a very ample margin, and, indeed, the additional weights of roof, supports, and floors help the stability. It is, of course, of enormous importance to

HAVE THE TANK ABSOLUTELY WATER-TIGHT, and this can only be obtained by two or three methods. One of the most usual is to have a

lining of asphalt behind the brick or tile facing, and in that construction it is very necessary to use only the best asphalt, and to have it applied in two layers. I do not think asphalt—vertical asphalt—is exactly a good surface for fixing tiles to, and that is no doubt why so many baths—even that fine one at Shoreditch—are lined with glazed bricks. Six-inch glazed tiles are surely preferable for appearance alone, and the introduction of coloured slips and painted tiles gives us a field for decorative effect. A safe backing is obtained with two layers of plain flat tiles laid to break joint, and alternated with renderings in cement; this, together with the tile face, makes an absolutely impervious facing 3in. thick, and I have never found the slightest leakage. In forming the platform round a bath we have to bear in mind that it can never be kept dry, and splashings and the wet feet of bathers, combined with mud from the boots of new-comers before undressing, would soon render the footways dirty, slippery, and dangerous unless they are frequently washed down with buckets of water and run over with the squeegee. They must, of course, be laid to a good fall away from the bath, not towards it, if only to prevent fouling the bath water. A gutter running down in front of the dressing-boxes will lead off the washings. There are more baths than one in London in which this gutter is placed at the back of the dressing-boxes, with pleasant consequences to the unwary bather who may happen to drop any article of clothing on the floor. To avoid this entirely, I find it better to raise the dressing-box floors above the platform level, the floor sloping outwards to the channel. A good curb—indeed, the best—round the bath is formed with slate 3in. or 4in. thick, and if this overhangs the bath a few inches, a wider footway can be obtained at very small comparative cost. It also prevents the bath water splashing over the footways. The gutter may be covered with a brass grating, but that is not absolutely necessary. Footways are usually paved with impervious material. Wood and York stone have been advocated, because they are essentially non-slippery—a matter of great importance. Bathers do not always walk sedately along the footways, and running along an impervious surface covered with a film of water is dangerous. But it is a pity if we must come down to York paving, with its monotonous colour and cold surface. Tiles laid herring-bone and in small pieces do very well; and there is another flooring which I will not recommend you till I have tried it, but which I think will be better still. Before we leave the bath itself, mention must be made of the safety rails, which should run round at least 4in. above the water-level. At the deep end the overflow trough serves the same purpose. At the shallow end there should be a spray-rail—that is, a hollow rail, pierced with a line of small holes, and connected with a high-pressure water-main. When the water is turned on occasionally, a regular and even spray is directed on to the surface of the water, which has the effect of cleansing it of scum and floating matter, which are driven down to the overflow-trough. I must only briefly mention the desirability of marking along the sides of the baths, in plain figures, not only the various depths, but distance in yards from the deep end, and other devices to aid in swimming contests; also the necessity of diving-boards, step-ladders, and water-chutes—the latter not being an unmixed blessing. All these matters have their importance, but a short visit to any modern bath will supply all such information.

#### DRESSING-BOXES

are always placed along the two long sides of the bath hall, and sometimes one end or both as well. Even so, it is impossible to get enough of them in comparison to the size of the bath. At Marylebone we have some short "transepts," so to speak, with boxes on each side, but I do not like the idea. Dressing-boxes out of sight are always liable to be rifled. Want of adequate dressing-box accommodation must be met by some drastic alteration, and I have a glimmering notion of two of some such innovation. To meet this difficulty at the Hornsey-road baths, the dressing boxes are placed in a separate room adjoining the bath; but the same objection holds even to a greater extent than with respect to transepts. A gallery is only necessary in the first-class or racing bath, and need not be more than 6ft. or 7ft. wide, unless we can afford such a one as that at the Shoreditch Baths. It is advisable to have at least two staircases from the platform level.

## CONVERSION FOR ENTERTAINMENTS.

I do not propose to dilate here upon the various matters necessary to fit the bath hall for use as a concert-room, or for other public entertainments, further than to suggest that if we study the London County Council regulations, and then satisfy the Council's district surveyor, nothing much is left to be done; but it is vital to bear in mind that these regulations have most important bearings on the planning, and should, therefore, be studied from the very first. Dressing boxes for a first-class bath should not, if possible, have less than 12sq.ft. of area (or, say, 3ft. 6in. square) although it is possible to do with as little as 9ft. They may, and I think should, be constructed with wood-framed sides and doors well painted with enamel paint and varnished. If we take care to keep the partitions well off the floor there is no reason why they should rot. Of course the use of oak or teak is an improvement, but even then I would have it well varnished or lacquered. When a bath is used for entertainments the boxes are of no use, and the room they occupy is much wanted. To meet this an ingenious arrangement has been lately patented, which, although capable of some improvement in construction, enables us to fold the sides, doors, and seats neatly and very quickly flat against the wall, where they form a fine panelled dado. They can be seen at the Shore-ditch Baths. With every swimming bath there should be what is called a

## SOAP AND SPRAY BATH.

which may be just one of the dressing-boxes fitted up with a foot-bath sunk in the floor, with hot and cold-water shower over. Spray and douche arrangements may be added with advantage. Indeed, it is an advantage to elaborate and enlarge this provision. As the result of a few remarks made in this room, I have had two long and interesting letters from a superintendent of baths in a Midland city. I shall have occasion to refer to one or two points he brought to my notice later on. But among other matters he described the soap bath of his establishment. He says in his first letter: "I like the increasing favour shown for the former [shower] kind of bath, and should be especially pleased to see it supersede the present arrangement of a soap bath as well as the slipper, as that can scarcely be considered a proper system which only allows one change of water for as many as forty persons for each change (I am referring here to the soap bath). The same bath-room, fitted with automatic feeding showers, having a regulated warm temperature, also a separate corner for a cold shower, would hardly use any more water, and even if all the dozen I have seen in at once were under the showers, they would each at least have clean water." Later on, in answer to my request for the dimensions, he says: "The dimensions are 8ft. by 5ft. by 18in. depth; usual depth of water 12in., therefore equal to about 240 gallons. A serious drawback, which I did not like to mention in my last, is the fact that there is no shower with it, so you may imagine the bathers plunging into the bath to clean themselves of the soapy water, especially after some dozen or so of moulders, mechanics, &c., have washed themselves." He adds: "I am forced to believe that the soap bath is also a serious competitor of the slipper on account of the cheap prices of the swimming."

## LIGHTING AND VENTILATION.

With respect to swimming-baths, I have only to add that they should be lighted by a large lantern with side-lights to open in the roof, and the walls should be lined with impervious material, glazed tiles or bricks for preference. A bath cannot be too well lighted. For ventilation—and a bath wants plenty of it—it is desirable to have an electrically-driven fan. I should add, by the way, that these fans give a lot of trouble, because they are so soon affected by the dampness. Perhaps some form of water-driven fan will yet be devised.

## WARM BATHS.

We have next to consider the warm baths, provided only for washing purposes. The present form is almost invariably the ordinary slipper-bath, as it is called; but—to be prophetic again—I think the days of its general use are numbered. Some of them will always be required, and it is worth while to describe them. The best form is, of course, the porcelain enamelled bath glazed inside and out, and

sometimes with a glazed rolled edge. Personally, I always use those glazed inside only, and with a wood top (teak for preference), because I think the greatly increased cost of outside glazing never worth the better appearance; and a roll edge, although cleanly, is uncomfortable, and may be dangerous. It also adds even more to cost. The usual length is 5ft. 6in. to 5ft. 7in. from out to out. These baths are usually inclosed in front, for reasons which have never quite convinced me, and I am now omitting the casings. Each bath is fitted up in a very small room, which has an area of 36ft., but better 40ft., or as much larger as can be afforded. The walls are generally built up of slate slabs, 6ft. 6in. to 7ft. high, sometimes left plain, and more often highly finished in enamelling. Marble is also employed, but I do not recommend it, and for this reason it is so necessary to keep these places absolutely clean that any surface which will hide even the appearance of dirt is to be avoided. Inversely, they should not only be clean, but look it, to inspire confidence. It is impossible to see at a glance whether marble is or is not perfectly clean. Various other forms of partition wall are employed, and notably a thin, glazed both sides, brick wall. I prefer the slate, because with its use no woodwork at all is necessary, even as door-posts. Each bath should be fitted with hot and cold-water taps, fixed on to the front partition with the valve spindles taken through, so that the attendant outside can turn on or off the water. In the same way the waste-valve should be operated by the attendant from the outside; but it is desirable to have the means of doing so also from the inside of the room. The floors of these compartments should, of course, be impervious to wet—tiles or mosaic if we can afford it, 'granolithic for economy. A disagreeable experience has taught me that these floors should be laid to fall. Bathers sometimes splash the water over the sides, and the baths also overflow at times.

## SHOWER BATHS.

Mr. Hessel Tiltman dwelt at some length upon the shower, or rain douche baths, which are in use in many Continental towns, and advocated their adoption in this country. At the time, I mentioned that some form of it had been successfully inaugurated by a Northern manufacturer for his workmen several years ago. I have since refreshed my memory, and will refer anyone who is interested in the details to a paper read before the Sanitary Institute Congress in 1888 at Worcester by Mr. Charles Clement Walker, F.R.A.S. The main idea of these baths is that the bather shall not be compelled to bathe in water which has already been fouled by what we may describe as the first washing of his body, but that every drop of water, as it becomes soiled, should be carried away at once. This idea was adopted over twenty-five years ago by Mr. H. Saxon Snell for lavatories in a Poor-law industrial school. It has been improved and modified since in many ways, but the principle remains the same. Another advantage of such baths is that they could be erected at about half the cost of the ordinary slipper bath, and it would be possible therefore to make a lower charge for their use—a matter of very considerable importance in the great work of reducing the numbers of that class which is facetiously dubbed the "Great Unwashed." It is, however, very hard to wean the public from old-established customs, however salutary the innovation proposed. It is a good beginning to provide a hot and cold shower to the slipper baths, and in time, no doubt we shall discard the bath itself. I say we, because I think most of us have a sneaking regard for the comfortable warmth of a casing 4in. thick of warm water for a few moments, and some of us love the shower—the cold shower—more in theory than practice. Before leaving the subject, it is well to note the necessity of light and ventilation, and plenty of both in the room. A lantern with opening sidelights is generally sufficient. One or two medicated, sitz, vapour, and other special baths may be included with advantage. Turkish baths in a public institution are as yet exceptional; but no doubt when their hygienic properties are more widely known, and when they can be indulged in more cheaply, no public baths will be completed without them. By the way, why should it be considered necessary to adopt exclusively Eastern forms and decoration in Turkish baths? They are none too soul-inspiring, and are certainly not "at home." Personally

I propose to break through the tradition in the Stratford Baths, and try the effect of the latest new humour in design. A fair-sized waiting-room, which should be comfortably furnished, is necessary to each set of baths, for there is much waiting to be endured at certain times in all establishments. Water-closets in the proportion of, say, one to fifteen baths, should be provided, and they should have direct and separate light and ventilation.

## TOWEL LAUNDRY.

Every set of public baths must have a small, completely-fitted laundry as part of the establishment. There should be easy means of communication between the departments, and this is the best achieved by the subways. If it is possible to have a shoot from each department in these subways a basket or trolley can be placed under to receive the dirty towels, and some labour is saved thereby. With respect to the laundry-room itself, the floor should be paved to falls, the walls should be faced, at least 6ft. or 7ft. high, with white glazed bricks, and there should be ample light and ventilation, mostly from the roof. The machinery should include the usual rotary washing-machines, centrifugal wringers, steeping and rinsing-tanks, and a few wash-tubs. Steam-heated drying horses are also required, and if there is not room for a fair number (and they take a disproportionate space), a cylindrical steam-drying and ironing machine will do a very large amount of work for the space it occupies. As the machinery must be power-driven, it is always desirable to have the laundry not too far from the engine-room; but it will be found desirable to keep the two departments quite separate, if women are employed in the laundry.

## ENGINE-ROOM AND BOILER HOUSE.

The engine-room and boiler-house should be quite show-places in their way. Until late years these vital parts of the establishment have generally been consigned to odd corners or dark basements—in fact, anywhere where the ingenuity of the engineer can possibly fit up his boilers, &c. Only two or three years ago I went over a building, but just then erected, which comprised public baths, a gymnasium, free library, and technical institute, in which the necessity of a boiler and engine-house had apparently been forgotten; indeed, I believe actually so. So the boilers were put in the subway, under part of the swimming-bath hall, and the engines and electrical plant were arranged in a line along the narrower part of the same subway. The towel laundry was 7ft. 6in. high, with no light but what could be obtained from little areas, and the communication between it and the engine-room was a doorway 2ft. wide and 4ft. high. It couldn't be bigger without cutting too much out of the bath-wall piers. In the smallest institutions at least two steam-boilers are required, and if three can be afforded, all the better; because with three boilers it is possible to use one for the direct supply of hot water. The engine-room must be closed off from the boiler-house, and room will be required for an engine, boiler, feed-pumps, lathe, and other tools. Adjoining the boiler-house should be a large coal-store, and, within bounds, the larger the better. It should have direct communication with the boiler-house and the public street.

## ADMINISTRATION.

We arrive now at the administration of the building. The superintendent's apartments should be designed like any other private house, and it should have separate access to the public street. Six, or at most eight, rooms are all that are necessary. A board or committee-room is necessary, and our clients will never complain if we lavish a little architectural display therein. A superintendent's store for towels, soap, and other necessaries is essential. It should scarcely have less area than 150ft., and may be nearly twice that size with advantage. If either of the baths are to be used at times for a gymnasium or public entertainment, we can scarcely have too much rough storage room, which may be in basement or even subways.

## DRAINAGE.

The swimming-bath drains should not be connected to the general system, and, if possible, each bath should drain direct into the public sewer, with the usual disconnecting trap, &c., of course. If they are connected to the general system, the enormous pressure and bulk of the

bath-water will quickly choke back the flow from any other part of the building, if it does not even find its way up the pipe into the lower parts. A large sluice-valve is necessary close to the bath outlet. It is important, too, to bear in mind that the outlet should be covered with a close grating. The warm baths may be taken direct into an ordinary drain, provided the latter discharges over an open trap. The end of the drain-pipe should be continued up in iron as a ventilator. A further precaution against foul air entering the room is to trap each bath. The Midland superintendent I referred to writes me that at his establishment the wastes are carried untrapped through the floor into a subway to discharge over a channel in the floor of this subway, which leads the water off to a trap; but, he adds, that in this case the channel is too shallow, and so the bath-water is practically discharged on to the subway floor with unpleasant results. It is not a bad idea to discharge over such a channel if it is only deep enough and can be regularly cleaned with a hose. Finally, every part of the drainage should be easily accessible, for delay in removing a stoppage might seriously disorganise the work of the establishment.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL business meeting of the Institute was held at 9, Conduit-street, W., on Monday, the President, Professor George Aitchison, in the chair, when there was a large attendance of members.

#### THE ROYAL GOLD MEDALLIST FOR 1899.

THE PRESIDENT moved, in accordance with the amendment made at the ordinary meeting a fortnight previously, that, subject to her Majesty's sanction, the Royal Gold Medal for the promotion of architecture be presented this year to Mr. George Frederick Bodley, A.R.A., for his executed works as an architect. The resolution, which was based upon a unanimous recommendation by the Council, was agreed to without dissent and amid applause.

#### THE LADY ARCHITECT ONCE MORE.

MR. HENRY DAWSON moved: "That, with the object of securing correct legal action in the election of candidates for membership of this Institute, the members thereof request the Council to obtain, at the earliest convenient date, the written opinion of some eminent Queen's Counsel of eminent position, as to whether women are eligible as Associates or Fellows under the terms and provisions of the existing Charter and by-laws of the Royal Institute of British Architects. And that the Council do report such opinion to the members at the earliest convenient date." The motion led to a long discussion, and was eventually lost.

#### A HITCH IN THE TESTS OF BRICKWORK.

MR. OWEN FLEMING proposed the following resolution: "That the attitude of the Council towards the brickwork experiments recently conducted by the Science Standing Committee is calculated to impair public confidence in the Royal Institute, and that the Council therefore be invited to take such steps as may be necessary to bring the matter to a satisfactory conclusion." The motion was carried.

#### WANTED, A BOLD ADVERTISEMENT.

MR. H. HARDWICKE LANGSTON had given notice of a motion as follows: "That in the opinion of this meeting it is desirable to put a suitable and prominent inscription on the street front of No. 9, Conduit-street, indicating that those premises are occupied by the Royal Institute of British Architects," but the proposition was held over.

#### SOME EARLY CHRISTIAN CHURCHES IN PALESTINE.

MR. A. C. DICKIE read an illustrated paper on this subject. He remarked that Jerusalem was rich in remains of Early Christian churches, and he had selected for discussion three interesting types of plans which were comparatively unknown—viz., those of the church of St. John the Baptist (11th century), an Armenian mortuary chapel (6th century), and the church of the Pool of Siloam (5th century). Before dealing with these, the lecturer briefly outlined the history, and described the great cathedral church of the Holy Sepulchre, the most important and most interesting early Christian church in Jerusalem. Constantine, in the 4th century, built a

basilica over the site of the discovery of the true cross by Queen Helena, and a rotunda over the Holy Sepulchre, which seems to have been separated from the basilica by a cloister. These were burned and destroyed by the Persians in 614, and partly restored by Modestus soon after, with the addition of a chapel over Calvary and a chapel to the Virgin Mary. Arculf (7th century) gives a plan of the buildings, showing the rotunda isolated, and, between it and the basilica, the chapel over Calvary and the chapel of St. Mary. The buildings were again destroyed and restored in the 9th and 10th centuries, and totally destroyed in 1010 by the Khalif Hakem. Not long afterwards they were restored, and in the beginning of the 12th century the restoration of the Crusaders made the church much as it is now seen from the house-tops; the façade, with its domes and tower and the Mohammedan minaret in the foreground, is the most charming group of the city. The rich, tawny colour of the weathered stone and the lead and white domes set in bright sunlight against the intense blue Syrian sky is a picture to be remembered. The lecturer acknowledged his indebtedness for the facts given of the church to the careful researches of Mr. George Jeffrey, a Fellow of the Institute.

#### THE CHURCH OF ST. JOHN THE BAPTIST

lies on the way to the church of the Holy Sepulchre, in Christian-street, adjacent to the Pool of Hezekiah. Over the original church a modern one has been built, very nearly on the same plan, and the ancient building now takes the place of a crypt, the surface of the ground being at the level of the upper church floor. The lower church is reached by a rude flight of steps on the south side descending into a narthex, from which three doors enter the main building. The total length of the church north and south is 62ft. 9in., and width 24ft. 9in., which the later wall thickening has reduced to 16ft. 6in. The west wall of the narthex is 6ft. 10in. thick. The floor of the eastern apse is raised 6in., and the original window is now formed into a recess. The present vaulting is Late Pointed, the centre bay having intersecting vaults and the flanking bays plain vaults. A close examination of the vaulting convinced the author that it had been constructed in the same way as the natives construct the vaults at the present day—viz., by a rude centring of timber, brushwood, and earth, modelled to the form of the vault, and then completed in concrete of stones and lime thrown quickly over the centring and left to dry. An Arab Effendi, when excavating the foundations for a new house, came upon one of the most beautiful Byzantine floor mosaics yet discovered. He preserved it by building a cell on the old foundations. The mosaic formed the floor of an Armenian mortuary chapel, a tiny rectangular cell 21ft. by 13ft., with an apse on the east end. The lecturer quoted Dr. Bliss's account of the discovery, and a note by Dr. A. S. Murray on the design of the mosaic.

#### THE CHURCH OF THE POOL OF SILOAM.

Next to the Church of the Holy Sepulchre, perhaps the most interesting is the church dedicated to the waters of Siloam in the middle of the 5th century. This long-lost ruin was discovered during the recent three years' excavations by the Palestine Exploration Fund under Dr. Bliss's direction. Having given a description of the Pool of Siloam and its present condition, and some account of Dr. Bliss's excavations, the lecturer went on to discuss the church itself. There is no record of any building attached to the Pool prior to the time of the Empress Eudocia in the middle of the 5th century. The sacredness of its waters to the pilgrim, who sought relief from their infirmities at its healing stream, inspired the Empress with the idea of building a place of worship over the Pool. The plan adopted is unique. It consists of a nave and two aisles, measuring over all 86ft. by 52ft. In the centre of the nave are four piers, 4ft. 3in. square, the supports of the Byzantine dome of a later restoration. The projecting choir is also of the period of this later work, as well as the thickening of the pier in the entrance colonnade to the north, inserted evidently to provide for the extra thrust of the dome arches. There is no entrance in the west, and access is gained in the north by a great stair of sixteen steps, 68ft. wide, descending through an arcade of seven arches, almost the whole length of the aisle. The staircase is reached by three doors, entering from an atrium, the centre doorway being accentuated

by the addition of a small portico. Between the doorways occur low stone benches set against the wall, used as seats. Ranged around the apse are five tiers of steps, with the centre raised at a higher elevation than the flanks for the seat of the bishop, as existing more or less complete at Torcello, illustrated by Fergusson. There is a small chapel in the east end of the north aisle, screened by a low screen of red marble 2in. thick, let into the sill and walls, and coped with a moulded coping stopped by moulded stone gateposts in the centre, the remains of which were found lying at this point. In considering the influences which had worked together to bring about the peculiarity of plan, the lecturer explained that the church was designed to fit into an existing scheme, in the building of which no such extension was contemplated. At that time the pool was believed to be supplied by a spring, the builders being ignorant of the existence of the Siloam tunnel. The position of the supposed spring to which the church was dedicated therefore fixed the position of the altar directly over the spot where the waters were believed to spring from, 27ft. below. This practically settled the eastern apse, and the west wall was fixed by the position of the rising scarp and city wall then existing, and forming the western butt of the great staircase, the necessity for incorporating the latter in the plan forcing the builders to draw the wall to within a few feet of the scarp, leaving a space only sufficient for a narrow passage and a western light to the church. It was desirable to have as much of the church as possible over the pool, and this was easily managed by carrying the south wall on the pool arcade and the aisle colonnade on the north wall of the pool. Thus the north was the only side available for the entrance to the church, and although the rapidly rising ground rendered this difficult, necessity demanded it, and the magnificent idea of a great staircase entering the north aisle through seven arches (almost its whole length) was the result. The traditional three doors were placed at the entrance to the staircase, and an atrium put in front. Thus all the traditions of the early church plan were retained in a modified form—a most successful solution of an exceedingly difficult problem. An unsuccessful attempt was made to buy the site, with the intention of restoring the church and pool to its original state. Among the illustrations was a sketch restoration made by the lecturer founded upon the theories advanced in his paper. A careful study of the existing remains leaves little to conjecture, as the buildings practically stand for a height of 35ft. from the pool pavement to the ruined top of the church walls.

Owing to the lateness of the hour, the PRESIDENT suggested that any members who wished to discuss the paper would do well to write to the *Journal* of the Institute, and the proceedings therefore closed with a vote of thanks to Mr. Dickie, on the motion of Messrs. W. EMERSON and R. PHENE SPIERS.

#### FOUL GAS IN SEWERS.

MR. J. CORBETT, the borough engineer of Salford, has favoured us with a copy of the following directions which have been issued by him, and may prove useful in other places:—

1. Open the lids of two adjacent manholes so as to provide a down-cast and an up-cast shaft; or if only one manhole is available, and there is no other outlet by an open sewer or vent-pipe, place a wooden tube about 1ft. square down the one manhole for use as a down-cast shaft.
2. Use one manhole, or the wooden pipe above described, as a down-cast shaft, by means of a heavy shower of water from a large watering can with a rose-jet, or else from a rose jet on a hose-pipe from the town's water-mains.
3. Where there are two manholes near together, use one for the down-cast shaft, by means of the shower of water above described, and use the other for the hoisting and working shaft.
4. Test the air in any shaft before men go down it by lowering a lighted candle down it. If the light burns dull, even without going out, the shaft must not be entered. Ventilate the shaft as before described, and test it again; and do not enter it until a light will burn brightly in it.
5. Beware of any mixture of combustible or explosive gas in the sewers or their manholes, and if any signs of such gases are found, obtain

skilled men and safety-lamps from some colliery, and let those men direct the work, giving them the help of ventilation, &c., as before described.

6. When a man has to descend a risky man-hole or shaft, he must have a strong rope properly tied about his shoulders, so that he could be lifted by it, and the ropes must be kept in hand ready to lift him up if he becomes overpowered by the gas. When a man has to crawl along a risky sewer he must have a short rope securely tied to his ankles, and a rope from it to hand, so as to draw him back if he becomes overpowered by the gas.

7. In any case of special difficulty or danger, report the case immediately to the borough engineer, so that he may take the responsibility of the work.

#### IRON CONSTRUCTION IN DRAINAGE WORK.—VIII.\*

By T. E. COLEMAN, F.S.I.

FIG. 106 is a sketch of a soil-pipe supported by "single tacks," whilst in Fig. 107 is shown a soil-pipe fixed with "double tacks." In some

Fig. 106.

Fig. 107.

cases the pipes are given a more ornamental and finished appearance by encircling them with a lead astragal or bead near the upper and lower end of each tack as indicated at A A (Fig. 107). All lead tacks should be secured to the walls with

Fig. 109.

stout copper nails or spikes, as iron nails are liable to be eaten away by rust.

Another form of lead tack used for small pipes is seen in Fig. 108. They are soldered to the pipes from the front side of the tack as indicated on plan in Fig. 109. Cast lead "socket tacks" similar to Fig. 110, soldered to soil-pipes, are also used for fixing purposes.

The upper end of lead soil and ventilating pipes are generally finished with a bead or astragal, and the opening covered with a domical copper wire grating to prevent birds building

therein. A modification of this arrangement is seen in Fig. 111. A series of perforations are made in the upper portion or body of the pipe, whilst the top is provided with the usual beaded end for the purpose of strengthening it as well as

Fig. 110.

Fig. 108.

improving its general appearance. The opening is protected by copper cross wires. Ornamental perforated cast lead tops of various designs may also be obtained if preferred.

When lead soil- and waste-pipes are fixed in

Fig. 111.

situations where they are liable to be damaged by passing traffic, or otherwise subject to rough usage, they should be protected to a height of 7 or 8 ft. from the ground by means of a stout iron shield or guard. The shield may either be

Fig. 112.

galvanised or painted, and should be so arranged as to be capable of being readily taken down and refixed when considered necessary for purposes of examination or repair.

Many varieties of gully-traps suitable for

Fig. 113.

connecting to iron pipe drains may be obtained. The choice of any particular pattern or description must, however, in a great measure depend upon the purpose for which it is required, and any peculiarities connected with the locality or mode of fixing.

Fig. 112 is a section through the "Tron" rain-water shoe or trapless surface gully. It is constructed of cast iron, and designed to retain any sand, gravel, &c., that may be associated with

Fig. 114.

the storm-water. The debris may be readily removed by raising the surface grating. This form of gully should only be used for clean-water drains which have been properly discon-

Fig. 115.

Fig. 116.

nected at their junction with any foul drains. The perforated grids to the trapless gullies insure the continuous and efficient ventilation of the clean-water drains to which they are attached. The

Fig. 117.

Fig. 118.

gullies may be obtained either coated with Dr. Angus Smith's solution, or glass enamelled internally. They are also obtainable in salt-glazed fireclay.

\* All rights reserved.

Fig. 113 illustrates a cast-iron trapped gully. The grating and body of the gully are circular in form, without angles or corners, so that the whole may be self-cleansing. Similar trapped

Fig. 113.

gullies, finished with glazed stoneware top (with or without flushing-rim) and iron grid are also obtainable. Fig. 114 shows a gully of this description, having a cast-iron trap or bottom connected to an iron drain, and fitted with stoneware gully top and side inlet (for rainwater pipe).

Fig. 120.

Figs. 115 and 116 illustrate the general construction of a disconnecting chamber for untrapped rainwater drains. Four drains (indicated on plan) converge to and discharge over a trapped gully directly connected to the foul-drainage system. The gully is arranged with a cast-iron trap and stoneware top, whilst the whole of the foul drains are constructed with iron pipes. Access to the drain beyond the trap is afforded

Fig. 121.

Fig. 122

by means of a suitable inspection arm fitted with screw-cap. A ventilating pipe is also placed near this point. Glazed stoneware pipes are used for the rain-water drains, and half-round stoneware channels within the manhole. The disconnecting chamber is provided with a ventilating cover, so that the rain-water drains (receiving the water from roofs, flats, &c.), being untrapped throughout their entire length, and open to the air at both ends, are thoroughly ventilated throughout.

Fig. 123.

Fig. 124.

A slight modification of the preceding arrangement is seen in Figs. 117 and 118, the rainwater drains being designed to discharge through inlets formed within the gully top. This is advantageous for situations where but little fall is available, as the outlets of the rainwater drains are thereby brought just above the water-seal of the disconnecting trap.

Another form of rainwater disconnecting gully is shown in Fig. 119. The drains discharge into the stoneware gully-top, as already described, the body of the gully being brought to the surface by means of one or more extension pieces, and finished with an iron grating and dished stone curb at the ground level. By this means the disconnecting gully also acts as a trapped-surface gully for carrying away the waste waters of the yard or area in which it is situated. A ventilating pipe is provided to the

Fig. 125.

Fig. 126.

foul drain, and, if desired, an inspection arm may also be arranged, as indicated by the dotted lines in the section.

A sketch of Winsor's patent flushing rim grease gully, with cast-iron bottom connected to an iron drain, and fitted with a glazed stoneware top, is shown in Fig. 120. The advantage of a combination of iron and stoneware, such as is shown in the foregoing illustrations, is that the whole of the joints on the drain side of the water-seal are run with lead and caulked, thus insuring air and water-tight connections throughout; whilst at the same time, stoneware gully-tops of normal pattern may be fixed according to local require-

Fig. 127.

ments. The joint between the stoneware and iron in the body of the gully is made with neat cement.

The cast-iron gully-trap shown in Fig. 121 is arranged with a catch-pit bottom for the purpose of retaining sand, &c. It may be provided with a movable bucket for cleaning purposes if desired.

Fig. 122 is a section through a stoneware gully-trap with iron grating. The inlet pipe or pipes enter the gully below the grid, but well above

Fig. 128.

Fig. 129.

Fig. 130.

the water-seal of the trap. The gully outlet may be of P, Q, or S pattern.

Special precautions must be taken whenever it is found necessary to fix surface gullies in situations where they will be subject to the rising or back-flow of tidal and storm-waters. Figs. 123 and 124 are illustrations of Couzen's patent gully-traps. It will be observed that the gully in the first-mentioned sketch (Fig. 123) is

provided with a hollow copper ball floating on the surface of the ordinary water-seal of the trap. Any rising of the water-level or back-pressure a once automatically forces the ball against the indiarubber seating attached to the iron fram

Fig. 131.

above, whilst the diminution or evaporation of the water-seal within the trap causes the ball to rest upon the lower seating. The gully shown in Fig. 124 is provided with a sensitive balance-flap which is arranged to rest upon its seating when in its normal position. The flap readily opens to allow the free passage of liquids entering from above; but should any back-flow of sewage or storm-water take place, the flap-valve is thereby tightly pressed to its seating. The ironwork of both types is securely fixed to the stoneware gullies by means of copper screws, so that no pressure of water will displace them.

Stable gullies should be so arranged as to prevent, as far as possible, the entrance of pieces of straw, &c., into the drain. Fig. 125 is a section through a stoneware gully provided with iron perforated bucket and grid, whilst Fig. 126 shows a similar gully arranged with an extension piece so as to allow the sewage matters to discharge over the perforated bucket, but under the surface grating. The form of stable gully shown in Fig. 127 is constructed of cast iron, and is fitted with a perforated bucket for the retention of solids, &c., together with a cleaning eye, to allow of ready access to the drain beyond.

The details of construction of the "Grosvenor" patent gully-trap are illustrated in Figs. 128, 129, and 130. It consists essentially of a receiver or shallow catch-pit, which retains any sand, gravel, &c., passing through the surface grating, whilst the liquid passes over a weir into the trapping chamber before entering the drain. The gully is also provided with an inspection eye for drain-cleaning or inspection purposes at any time. Fig. 128 is a general plan for the gully, showing the surface grating; the space occupied by the receiver and the trapping chamber respectively being indicated by the dotted lines. Fig. 130 (section A B) shows the weir separating the receiver and the trapping chamber; whilst Fig. 129 (section D D) is a section through the

trapping chamber showing the water-seal, the upper portion of the weir and the opening from the receiver to the trapping chamber being seen in elevation. This section also shows the arrangement of the inspection eye for access to the drain, an air-tight joint being obtained by means of a composition of tar and pitch. The space between the stopper and the iron surface cover is some-

times filled with sand, charcoal, &c. The receiver or catch-pit of the gully may also be provided with a removable dirt bucket if desired. The general appearance of the gully is seen in Fig. 131.

When large quantities of greasy liquids are discharged into ordinary gullies the drains are liable to become choked by the gradual accumulation of grease, unless special precautions are taken. Many devices have been introduced from time to time in order to overcome this difficulty. The grease-gully shown in Fig. 120 is largely used for this purpose. An automatic flushing-tank, arranged to discharge at certain periods, is connected with the flushing rim of the gully, in order that the velocity and volume of its discharge may break up the fatty particles collected within the gully and carry them through the drains.

Grease-traps designed for the purpose of collecting and retaining any fatty substances which may be discharged into them are also extensively used. The grease is removed from

Fig. 135.

the trap by hand at stated intervals, instead of permitting it to enter the drains. Figs. 132 and 133 are the plan and section of a typical cast-iron grease-trap. On entering the circular receiver—containing a comparatively large volume of water—the liquid grease becomes solidified, and, rising to the surface of the water, gradually forms a solid cake of fat, whilst the remaining portion of the liquid flows into the drain. The grease-cake is then removed from time to time.

Another form of grease-trap is seen in Figs. 134 and 135, the inlet and outlet being cast separately from the body of the trap. When fixing the trap, the inlet and outlet may, therefore, be placed at any required angle, the joints being afterwards run with lead and caulked.

#### ACETYLENE GENERATORS.

THE report of the committee appointed by the council of the Society of Arts to inquire into the requisite conditions of safety in acetylene gas generators, and to report on the various apparatus shown at the exhibition held at the Imperial Institute, has just been issued. The object of the exhibition was to familiarise the public with the means of generating acetylene gas, and with the simple precautions with which its use, at low pressures, is as safe as coal-gas. The committee appointed Professor Vivian B. Lewes and Mr. Boverton Redwood as a sub-committee to make a series of tests of the various forms of generation. As a result, the committee have advised the granting of certificates to those generators which have complied with the requirements of the various tests to which they have been submitted, and which have worked safely and satisfactorily during a month's everyday use. The committee classified the generators into three groups:—(1) those in which the gas is generated by water being allowed to drip or flow on to the carbide; (2) those in which the water is allowed to rise in contact with the carbide, the rise being regulated by the increase of pressure in the generating chamber; (3) those in which the carbide drops into the water. These are again subdivided into—automatic generators, whose storage capacity is less than the total volume which the charge of carbide is capable of generating, and which, therefore, require automatic regulation; and non-automatic, whose holders can receive all the gas produced by the charge of carbide. The committee consider that

the tests have clearly demonstrated that many types of acetylene-gas apparatus can be so constructed as, with ordinary precautions, to be absolutely safe, and that lighting by acetylene need be no more fraught with danger than any other form of artificial lighting in general use. The committee, however, feel it their duty to state that, safe as they consider acetylene gas to be, when generated in a properly constructed apparatus outside the building to be lighted, and in accordance with the rules and suggestions contained in the report, they consider the generation of gas within the house, and the use of hand-lamps, cycle lamps, &c., to be not unattended by danger, except in skilled hands. As to the storage of the carbide, the Home Office regulations allow 5lb. to be kept without a license in 1lb. packages. The committee recommend that the quantity, however small, should always be kept in a dry place, and under lock and key.

#### THE LUXFER PRISMS ELECTRO-GLAZED, AND THEIR RESISTANCE TO FIRE.

THE British Luxfer Prism Syndicate, Limited, of 16, Hill-street, Finsbury, have lately undertaken a series of important tests which have conclusively proved the fire-resisting property of their electro-glazing process, already described in this journal. Last Saturday we visited the Hill-street factory, to examine for ourselves the behaviour under these tests of the electro-glazing

Fig. 1.

method adopted by the syndicate in the mounting of their Luxfer prisms, and of plain or ornamental glass. We may remind our readers who have not already visited this interesting factory, that the usual wide lines of lead, zinc, or brass ordinarily used for mounting obstruct a large portion of the light which passes through the window, and also add to the weight. By the invention of electro-glazing the plates or sashes of glass are at once rendered neat in appearance (Fig. 1), elastic, weather and fire-resisting. We have described the process as the insertion of strips of flat copper between the pieces of glass (Fig. 2), which are made to assume rectangular,

Fig. 2.

Fig. 3.

geometrical, and curvilinear forms. The strips are touched with solder at the points of intersection, and the sheet thus put together on a table is afterwards submerged in a copper bath, where it remains 30 to 40 hours. A deposit is formed on the flat ribbon of copper, tightly filling up the space between glass and copper strip, while at the ends a flange-like projection is formed, which secures and holds the glass tightly. By this process the electro-glazed plate is made very strong, the glass and copper deposit are joined as one piece, and if the glass is broken the pieces are found to adhere to the copper deposit. So strong and elastic is the plate thus formed that a piece 20in. square and  $\frac{1}{4}$ in. thick was found to have a stiffness exceeding plain glass of the same size.

Three samples of glazing—one of plain thick glass, one of leaded glass, and another of the electro-glass with copper mounting—were exposed to severe fire tests. Sheets of flame from numerous gas-jets were made to play on each specimen. The two first soon began to show signs of failure, and the glass began to crack away from the frame, and the flames to pass through. The leaded glass gave way almost suddenly, the lines of lead melting and letting out the glass; but the electro-glazed plate resisted the fire entirely, although exposed to a great heat a long time after the others had been burnt through. The heated glass in all three cases was exposed to jets of cold water, which speedily cracked the panes, causing the pieces in the former two specimens to fall out; but the electro-glass remained intact, although cracked, and held the flames at bay. These tests proved beyond all doubt that the ordinary systems of glazing offer little or no obstacle to fire, while the electro-glazed specimen withstands the most intense flames, and offers a splendid resistance to the spread of fire. In great fires, much peril is caused by the breaking of the glass in windows, allowing the flames to burst through, and causing imminent risk to firemen on fire-escapes placed opposite the windows. The Luxfer electro-glass window is proof against this danger.

The Luxfer Prism Syndicate have published a very useful illustrated manual, which not only describes the application of the Luxfer prisms to a variety of purposes, and their wonderful illuminating effect in darkened interiors by refracting the light from the sky in horizontal and other required directions, but explains an easy method of selecting the prisms proper for a given room by means of a protractor with the various angles marked. Suppose we have a room to light: a vertical section of the building on the other side of the street, window, and room is made, which is easily obtained in case of a new building from the architect's section. From the bottom of the proposed prism plate or window to the top of building on the opposite side of the street draw a line. The protractor is then placed with its horizontal line passing through the lower part of prism plate. Then the oblique line of the summit of opposite building indicates at a glance the proper prisms to use—whether sash or canopy prisms, the former being the vertical sash prisms, the latter, as its name implies, being the part of the light which is received overhead to the angle of  $38^\circ$  from the vertical. By the aid of the Prism Table given in this manual the proper prism can be at once selected, by the aid of the zenith angles from  $35^\circ$  to  $70^\circ$ . Thus, if the window has a zenith angle of  $50^\circ$ , the ray leaves the prism marked L,  $10\frac{1}{2}^\circ$  below the horizontal, or the M prism  $6\frac{1}{2}^\circ$  below, the numbers giving the direction in which the rays from certain angles leave the prisms, which are generally marked by letters. By this means a prism can be chosen which refracts the light in the required direction in the room. Small zenith angles are best provided for by using a canopy prism, which receives more light than that from the vertical window, and these canopy prisms are made to project out from top of window, the prisms being fixed in a separate iron frame which can be held by chains or brackets, and can be made a feature by the architect. For canopy the "A" canopy prism is recommended. The subject of selecting the right prisms for different zenith angles is explained under different groups, so that any architect will have no difficulty in selecting the prisms that are required. Several sections are given, showing the various applications of canopies and new mode of fixing. We cannot doubt that this system of introducing daylight will be extensively used in the future, and as light-courts or wells are not necessary, a great saving in cost in these objectionable features will be effected, besides the reduction of fire insurance required to light interiors during the day, and also the saving of cost of shutters, which the electro-glazing renders unnecessary. We strongly urge all architects, builders, and property owners to visit the works of the British Luxfer Prism Syndicate, and witness for themselves a fire test of any kind of window glass electro-glazed. They will agree with us that the end sought is most effectually achieved.

Mr. J. A. Lucas, of Exeter, surveyor to the Okehampton Charity Trustees, has been elected borough surveyor and sanitary inspector for Okehampton, in succession to Mr. H. Geen, resigned.

OLD PULPIT, ST. ANDREW'S.

## OLD PULPIT, ST. ANDREW'S.

THIS quaint old pulpit (which is supposed by antiquarians to have been the one in which John Knox preached) now occupies a position in the museum of St. Andrew's University. The desk or box in front was occupied by the "precentor," who used to be an important functionary in the Scottish Church. The lamp-bracket and hour-glass are of wrought iron, and the pulpit itself is made of dark oak.

W. HODGSON BURNET.

## THE WORKING OF THE LIGHT RAILWAYS ACT, 1896.

THE subject mentioned above was dealt with in an interesting paper read by Mr. F. J. Smith, of Southampton, at the ordinary general meeting of the Surveyors' Institution, held on Monday evening last. The author dealt principally with the Basingstoke and Alton Light Railway, and claimed to speak with some authority, as having dealt with claims on behalf of owners and occupiers of land throughout more than half of the district traversed by the line in question. He referred at length to the sections of the Act on which the "Order" of the Light Railway Commissioners was based, section 11 defining what shall or shall not be incorporated in an order, section 12 (subsection 1) naming the Clauses Acts which are not applicable to a light railway unless specially incorporated in an order, while subsection 2 stipulated that the general enactments applicable to railways should be applicable to a light railway. Section 13 directed the mode of procedure on going to arbitration on the value of land taken and compensation, subject to such Acts, &c., as may be detailed or incorporated in an order under the two preceding sections. It was, the author thought, probable that in some cases owners might prefer the nomination, as arbitrator, of some local surveyor, whose knowledge of the country through which a projected light railway would pass, would be advantageous, or they might prefer a well-known expert as arbitrator. On the other hand, promoters might prefer an arbitrator with less local knowledge or influence, or might even prefer a nominee of the Board of Trade, in which case that department would have the appointment in its own hands. The author's practice had been to suggest the names of three surveyors of repute—not necessarily local men, but Fellows of the Institution by preference—with the request that the promoters should select

one of them as arbitrator. The provision that the arbitrator should have regard to the extent to which remaining and contiguous lands might be benefited touched the principle of "betterment." The determination of such benefit was left entirely to the arbitrator, who might allow as much or as little as he pleased, and who, without any guidance or precedent, appeared to be placed in an onerous and difficult position. He was by law directed to do what was practically impossible, for he must "have regard to the extent" of any improvements or benefit which might accrue to the adjacent lands by reason of the light railway—presumably on and after its construction—and must determine the extent of such benefit at the time of estimating the amount of compensation. It seemed clear, said Mr. Smith, that the object of the measure was to place every case of compensation and of betterment on its merits in view of cases where the principle of betterment as generally understood could not be applied nor any improved value accrue from a light railway, as in cases where the property was already served by a railway, or where stations, sidings, and works were not required. A light railway might either immediately or ultimately improve the value of adjacent property, and with respect to immediate beneficial value, the author first considered residential properties and agricultural estates having no special adaptability for development. The benefit likely to be felt would be due to facilities for goods and passenger traffic, and any value accruing therefrom must be evidenced by a saving in working expenses, improved rental, and personal convenience. It might be fairly assumed that light railways would not be constructed of any great length, and would not open up any large tracts of country as the ordinary railways had done, and, indeed, section 9 of the Act seemed to intimate that the Board of Trade would not sanction the construction of a light railway where the undertaking was of such magnitude that it should be submitted to Parliament in the ordinary way. Consequently agricultural estates within, say, seven miles of existing railway stations, would hardly appreciate any saving in expenses of cartage. Farms might let more readily, but it was a question whether they would command a better rent. The advantage to personal convenience would of course depend on the service of trains. The conversion of corn farms into dairy farms, which it was assumed would follow the construction of these railways, would, he feared, involve an outlay on buildings, fences, &c., which would neutralise any possible benefit. There was, he thought, a

general opinion among those best qualified to express one, that light railways would not raise the fallen fortunes of agriculture to any appreciable extent, and the logical conclusion seemed to be that landowners would not be very much benefited in consequence. The author then dealt with the question of "tolls," which, in the event of a light railway not being profitable might be raised to the maximum authorised by the Order, and this increase made subsequent to the award of the arbitrator, based on the probable beneficial value of the adjacent property. "Deferred beneficial value" could only apply to lands which could be developed for building purposes or for the working of minerals, or where, by special arrangement, special accommodation was provided by the promoters, or where agricultural or residential estates are not already served by a station within, say, five miles. The author held that any existing railway company constructing a light railway for the purpose of joining a branch with main lines was not entitled to "betterment" beyond the amount (if any) added for compulsory sale of the land taken. Mr. Smith then gave details as to the provisions of the Act regulating the construction of light railways, the raising of capital, advances by the treasury, free grants of land, repayments of loans and advances, and the system of orders by the Board of Trade, illustrating his remarks by references to the Basingstoke and Alton Railway above referred to, the total cost of which was estimated at some £64,000 for some 12½ miles of railway, including land, stations, permanent ways, bridges, &c., or some £5,140 per mile, including everything.

A short discussion followed, in which Messrs. G. Langridge, A. G. Rickards, H. W. Towse, J. L. Crouch, W. H. Warner, and L. R. S. Walcott took part.

## VENTILATION OF THEATRES.

IN speaking of theatre sanitation, Mr. W. Paul Gerhard, who is the author of many useful sanitary publications, refers to ventilation of theatres, often sadly neglected in new buildings. Every part of a theatre should be ventilated, the stage as well as the auditorium, dressing-rooms, engine-room, vaults, and the retiring and toilet-rooms. A system of extraction is of no use unless a supply of pure air, drawn from an uncontaminated source, is combined. Extraction only means a sucking up of the air of all these parts of the house. The fresh air should be warmed and filtered in winter and sprayed or cooled with ice in summer, and it should enter without causing draughts. The inlets and outlets should be of good size, and the author remarks every person in the audience should have a supply of fresh air equal to at least 30c.ft. per minute, or 1,800c.ft. per hour. Mr. Gerhard says: "The fresh air may be introduced at the top of the house, through the ceiling, and made to move downward in a steady and uniform current, until it reaches the lungs of the spectators, and then removed at or near the floor line; or else air may be introduced at or near the bottom, and exhausted at the ceiling of the hall. Either one of the systems may be successfully planned and arranged. The plan and subdivision of the building, the details of construction, and local conditions will generally decide the question. When the theatre is lighted with electric lights, the downward system will show better results than where gaslights are used." He also says a good system should effect a complete change of air three or four times an hour.

The scheme of ventilation ought to be considered in connection with the safety of the building from fire. A current of air from the stage towards auditorium would be serious in case of fire, which generally originates on the stage, as the smoke from the burning scenery, &c., would be drifted towards the upper part of auditorium, and suffocate people before they could escape. The air current should be in a contrary direction from auditorium to stage, and to effect which large ventilators over the stage to create a draught thereto are required. As to the dressing-rooms, &c., these may be ventilated by windows to the outer air or by vent shafts. The currents of air should be maintained from the theatre and halls into the toilet-rooms, so that all odours from the closets, &c., will not reach the theatre. For the latter purpose, Mr. Gerhard's downward ventilation would probably serve the best, though there are

objections to the system, as, for instance, in the fresh currents from the ceiling forcing the vitiated air rising from the auditorium back through the lungs of the people before it is finally expelled through the floor outlets. The question of the ventilation of theatres is fraught with difficulties, and playhouses in London, even amongst the later ones, are far from giving satisfactory results. The usual entrances generally act as the main inlets for the cold fresh air, which forces back the eddying currents of vitiated air upon the people, besides causing dangerous draughts of cold air to those near the openings.

#### THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening at 9, Conduit-street, W., the President, Mr. G. H. Fellowes-Prynn, in the chair. Messrs. N. B. Fairweather, C. F. Houston, and G. Gilbert Scott were elected as members. The President announced that a meeting of members desirous of resuscitating the A.A. Bicycling Club will be held at 56, Great Marlborough-street, W., on the following Friday evening (to-night) at 7.30 p.m. It was proposed, at that meeting, to draw up rules, appoint officers, and arrange club-rooms, and he trusted there would be a large attendance; if the revived club were worked conjointly with the A.A. Camera Club, much good and useful work would be done. Mr. E. Howley Sim, the hon. sec., proposed a vote of thanks to Mr. J. F. Bentley for permitting members to visit the new Roman Catholic Cathedral at Westminster on the 18th Feb. He also mentioned that the next spring visit would take place on Saturday, the 11th inst. (to-morrow), to the Great Central Hotel, Marylebone-road, at 2.30 p.m., under the guidance of Col. R. W. Edis, F.S.A., and at 3.30 the members would proceed to the Great Central Railway Station adjoining, when Mr. E. Wragge, the resident engineer, would conduct the party. Several donations to the library were announced and acknowledged with thanks.

#### PUBLIC BATHS.

A paper on this subject, illustrated by numerous plans of recent English buildings lent by the respective architects, was read by Mr. ALFRED SAXON SNELL, F.R.I.B.A., and is fully reported on p. 328, ante.

The President, in inviting discussion, referred to the practical and instructive character of the paper, and expressed curiosity as to the new paving material for the edges of the bath pathways. He suggested that more boxes could be arranged down the side of a swimming-bath, if the frontage-line of the boxes was curved inward at the centre, and concluded by proposing a vote of thanks to the lecturer.

Mr. T. NORMAN DINWIDDY seconded the motion, remarking that for edging a bath slate had a good appearance, but grew slippery in use, and mosaic was still more cleanly, but also had the drawback of insecure foothold. Cork paving promised to be more satisfactory, but he had not yet seen it tried. The cost of renewing the water in a large bath was very great, and it was undoubtedly cheapest to provide an independent supply, as the engine could be alternately used for pumping and working the laundry machinery. Storage tanks of great strength had in that case, however, to be provided.

Mr. E. H. PAYNE pointed out that Mr. Saxon Snell had omitted in his model plan to show cross-ventilated lobbies between the baths and closets; unless cross-ventilation was provided, a most objectionable smell rested on the surface of the water. In nine cases out of ten the galleries provided for swimming-baths were practically useless, for none but those in the first row could see what was going on in the water. Another defect in the newest baths was that no means was provided for professionals getting from one end of the bath to the other, except along the front. At Shoreditch there was a well-arranged gallery, but it projected too far over the water. He feared English bathers would object to using a douche bath before entering the swimming pool. He saw Mr. Saxon Snell provided in his model plan a club-room for the second-class bath, a feature which seemed quite unnecessary. He did not like the complicated pay-office arrangements at Newington; the best arrangement was that seen at Shoreditch. Subways were not so much utilised as they might be for the collection of wet towels, &c.,

or trolleys running on tram-rails, and communicating by lift with the floors above.

Mr. C. H. BRONIE said it was the body, not the feet, that fouled the water of baths. The old-fashioned slipper-bath was a stupid survival, and should be replaced by the douche bath.

Mr. H. E. CLARK asked as to the cubic cost per foot of public baths.

Mr. ERNEST HERBERT advocated the adoption of the plan to be seen at Edinburgh, of providing a passage at the back of boxes. By this method the pathway is not muddled by boots; on the upper floor instead of the usual gallery was a tier of slipper-baths.

Mr. MARCHANT, superintendent of the Marylebone Baths, said it should be the duty of the attendant to see that dirt was not carried on to the pathway, and if any were, to have quickly removed. In his baths they emptied and refilled the bath every day in the summer. They also provided a cold shower bath for first-class bathers, and for a small extra payment a warm shower could be supplied. A subway would be beneficial to allow professionals to get from one end to the other of a bath; but if a passage were made behind the boxes it would need constant watching. It was difficult to devise a gallery in which more than the first two or three rows of spectators could see the whole water surface. The huge baths, now so fashionable, were very expensive to fill sufficiently often; a length of 100ft. was quite sufficient for all practical purposes.

Mr. F. PERKINS said tanks could only be made water-tight by building with a cement backing and asphalt, and it was necessary to insure a sound junction between the materials. It was impossible to secure an impervious walling by using cement alone. The architect should be careful to call in a consulting engineer to advise him, and not a mere tradesman.
